Jersey cattle men outlined their needs in part at the members' banquet. Meetings should be held to exploit the excellences of the breed. The idea has been successfully used by the Ohio Grange. The short tests were condemned and the toy cow criticised.

"We want to preserve the breed characteristics in the Brown Swiss," was the opinion of M. T. Ayers of the Swiss Association. "We can have coarser small cows, and fine large animals. Our cows range from 1,000 to 1,700 pounds and the bulls from 1,600 to 2,700. These are extreme figures, but the average for cows is 1,400 and for bulls about 1,700 pounds."

Breed Tendencies and Judging Considerations.

JERSEYS.—As far as one could tell by standing beside the ring and watching what was going within, there are certain tendencies which the different breeds are working toward. I heard a number of opinions expressed privately that the judges this year do not seem to be sticking quite so close to the triwedge conformation. I refer here to the judging exhibitions at the National Dairy Show. One would have to qualify even this statement somewhat, for the tendencies in the different breeds are somewhat different, but it was quite noticeable that the first prize animals were somewhat beefier than the general run of those selected last year. In the Jersey breed, the judge placed a large amount of emphasis on the fore-udder, and lack of development here was discounted heavily. This may be accounted for in the fact that the natural tendency of the breed is to have a shallow fore-udder, and the judges placing a large amount of emphasis on this point will tend toward a stronger development in this noticeable weakness.

HOLSTEINS.—In the Holstein breed, some of the animals that walked off first honors last year did the same thing again this show, but others did not, even though in some cases, they were competing against practically the same individuals as last year. This brings up an important consideration that will be spoken of later.

GUERNSEYS AND BROWN SWISS.—In Guernsey circles, there were no noticeable breed tendencies, but these were very well marked in the Brown Swiss. The individuals that were shown in this breed presented a very much improved dairy type and conformation over those shown last year. The same old girl that carried off the grand championship in the cow class this year repeated the same thing for two years back, and she is indeed a superb individual. She lacks the general symmetry of form that is possessed in large measure by the Brown Swiss as a breed, and she is of standard dairy form. Should the men engaged in turning this breed dairyward take this old cow owned by H. W. Ayers as an example of what they are striving for, they will have a breed of exceptional dairy type. This can hardly be said of some of the prize winners in some of the other breeds.

POINTS IN JUDGING.—Now I am done with the discussion of the breed tendencies as displayed at the International. I wish now to point out some judging considerations, but before I commence, let it be perfectly understood that I do not question the sincerity and good judgment of those who took part in the International performance. There are some questions which are not well settled in the minds of the general livestock public as well as myself and I am sure that anyone who can set us aright on these points will be welcome to THE R. N.-Y. circle.

THE SCORE CARD.—In the first place, why isn't the udder of a Holstein just as important an asset as is the udder of the Jersey? You say it is, and then I ask why does the Holstein score card give 10 points for udder, while the Jersey score card allows 40 points for the very same appendage? It looks to me as though the udder of the Holstein should be just as important a point in judging her as the udder of the Jersey. I ask this for information, and will all gladly welcome any enlightenment. That takes us back to what the score card is. As I understand it, the score card is the crystallized opinion of seven or eight men high up in any one breed as to what attributes the perfect cow of that breed should have. This sets up an imaginary cow as an ideal. A dozen different breeders will have the imaginary cow in mind, but your cow will not look exactly like mine, and my cow will not look exactly like the other man's. If I judge the ring, I pick out as the prize-winner the animal that comes the nearest to my ideal. If Jones does the judging, his prize-winners are those animals that conform the closest to his ideal of a perfect cow. Resulting from this basis, blue ribbons will be given to two different cows, and when it comes right down to really telling which one is the best producer, regardless of our judgments, we shall have to try the old cow before a jury composed of the milk scales, Babcock tester, milk record and feed record. These are the real criterions of the cow's value.

JUDGING BY PERFORMANCE.—That vast horde of cows had been brought from all over the countryside and mere men purported to be picking out the best ones in competition. What mockery it was to see this thing going on in the pavilion, turn on your heel and walk upstairs to the University of Missouri exhibit and read this placard:

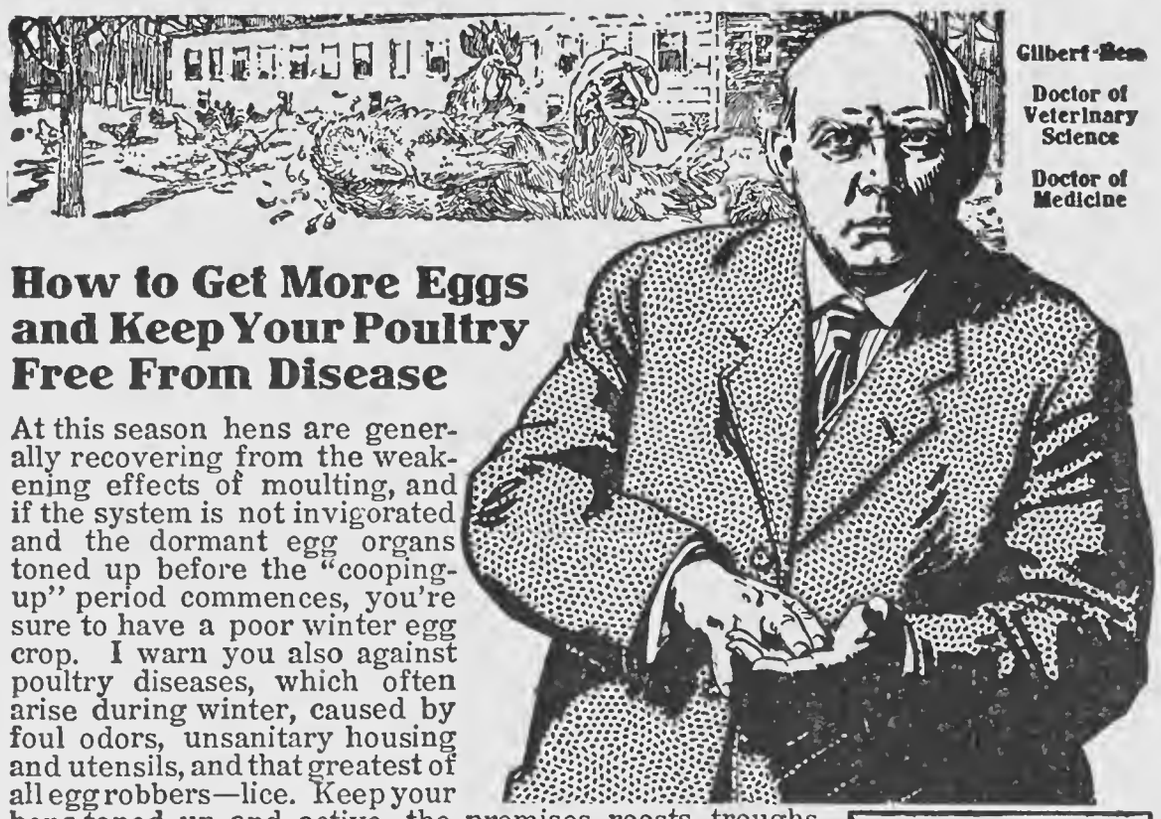
"It pays to test your cows. You cannot tell how much milk a cow will give, or how rich her milk will be by her appearance. The only accurate way to tell what your cows are doing is to weigh and test their milk. (Pictures of two cows). These two cows are half sisters. They are purebred Jerseys. They receive the same kind of care and the same kinds of feed. The figures given are the averages for three years.

	PEDRO'S ELF	UNIVERSITY DAZIE
Value of butter.....	$32.70	$144.90
Cost of feed.....	31.00	62.00
Value of butter above cost of feed.....	1.70	82.90

"Pedro's Elf ate one-half as much feed as the other cow but produced only a little more than one-fourth as much butter. University Dazie ate twice as much feed as the other cow but produced four and one-half times as much butter."

JUDGING BY CONFORMATION.—We need a scientific basis for judging cows if they are to be judged by conformation alone. Polishing the horns is all right, and makes the animals look nicer, but it should not enter in any way into the judging of a dairy animal if one pre-

(*Continued on page 1355.*)



How to Get More Eggs and Keep Your Poultry Free From Disease

At this season hens are generally recovering from the weakening effects of moulting, and if the system is not invigorated and the dormant egg organs toned up before the "cooping-up" period commences, you're sure to have a poor winter egg crop. I warn you also against poultry diseases, which often arise during winter, caused by foul odors, unsanitary housing and utensils, and that greatest of all egg robbers—lice. Keep your hens toned up and active, the premises, roosts, troughs, etc., clean and disinfected and you'll have very little trouble getting a plentiful supply of eggs during winter.

Dr. Hess Poultry Pan-a-ce-a

Makes Poultry Healthy—Makes Hens Lay

Dr. Hess Dip and Disinfectant

Destroys Germs—Deodorizes—Cures Skin Diseases

These two preparations are the result of my lifetime experience as a doctor of veterinary science and a doctor of medicine and a successful poultry raiser. My Pan-a-ce-a will help your hens recover rapidly from the debilitating effects of moulting; it will tone up the dormant egg organs and compel each hen to lay. My Pan-a-ce-a contains *tonics* to aid digestion and appetite, *blood builders* to enrich the blood and *internal antiseptics* to keep the system cleaned and conditioned against disease. One tablespoonful in the mash is enough for thirty fowl at the trifling cost of 1c per day.

Dr. Hess Dip and Disinfectant destroys disease germs, foul odors, and is an effective remedy for parasitic skin diseases. For cleansing pens, stables, barns, outhouses, sinks, drains, troughs, garbage cans, etc, Sprinkle it around the poultry houses, on the roosts, in the cracks—use it wherever there are foul odors, filth, lice and other poultry parasites. It is non-poisonous and non-irritating; always uniform in strength and one gallon makes 75 to100 gallons of solution.

Now read every word of this broad statement:

So sure am I that Dr. Hess Poultry Pan-a-ce-a will shorten the moulting period, make your poultry healthy and your hens lay—that Dr. Hess Dip and Disinfectant will destroy foul odors and disease germs, prevent and cure skin ailments and keep your premises clean and sweet smelling—that I have authorized my dealer in your town to supply you with enough for your poultry, and if these preparations do not do as I claim, return the empty packages and my dealer will refund your money.

The above dependable and scientific preparations are never peddled—sold only by reputable dealers whom you know. Dr. Hess Poultry Pan-a-ce-a, 1½ lbs. 25c; 5 lbs. 60c; 25-lb. pail $2.50. Except in Canada and the far West. Dr. Hess Dip and Disinfectant is sold in pint bottles, quart and gallon cans, also in barrels.

Dr. Hess Stock Tonic

Taken off pasture, put on dry feed and closely confined, your stock are apt to get out of fix during winter. Some are liable to get constipation, dropsical swellings, stocky legs, but most common and dreaded of all diseases, especially among hogs, is worms—worms. Dr. Hess Stock Tonic will keep your stock toned up, enrich their blood, keep their bowels regular and will rid them of worms. 25-lb. pail $1.60; 100-lb. sack $5.00; smaller packages as low as 50c. Except in Canada, the far West and the South.

Dr. Hess Instant Louse Killer

Kills lice on poultry and all farm stock. Dust the hens and chicks with it, sprinkle it on the roosts, in the cracks and dust bath. Also destroys bugs on cucumber, squash and melon vines, cabbage worms, slugs on rosebushes, etc. Comes in handy sifting-top cans. 1 lb. 25c; 3 lbs. 60c. Except in Canada and the far West. I guarantee it.

I have a book about Dr. Hess Poultry Pan-a-ce-a and Dr. Hess Dip and Disinfectant that you may have for the asking.

DR. HESS & CLARK, Ashland, Ohio

MAKE HENS LAY

By feeding raw bone. Its egg-producing value is four times that of grain. Eggs more fertile, chicks more vigorous, broilers earlier, fowls heavier, profits larger.

MANN'S LATEST MODEL Bone Cutter

Cuts all bone with adhering meat and gristle. Never clogs. 10 Days' Free Trial. No money in advance.

Storrs, Conn.

Feeding Roots: More and Better Milk—Beef Mutton

ALL animals improve in condition and increase their product of flesh, milk, wool, etc., by being fed liberal rations of cut roots. No matter what else you feed, cut roots will improve the ration. They add a zest which means increased consumption of roughage and aid in digestion and assimilation. They put a top finish on market sheep and lambs. They put color and richness in milk and cream and resulting butter.

Banner Root Cutters

for both hand and power, prepare roots in the best possible way. Cut so fine as to prevent all choking of animals. It's done with the **"Non-Choke Curve Cut."** Made in seven sizes. Write for free illustrated booklet. Every animal condition will be improved by feeding a ration of cut roots.

THE EGG-LAYING CONTEST.

SATURDAY, Oct. 31, was a perfectly ideal day, and that it was so was well appreciated by the busy crowd at the contest who, after the days "lay" was over, had to get 800 birds out of their houses, into shipping crates, and 1,000 birds into the laying houses, so they might be in position promptly to commence Sunday morning, Nov. 1, laying the eggs which will make a new record. The three highest pens in the contest just closed are so close together that the honors are practically equal. Francis F. Lincoln's pen of White Leghorns win. There can be no question, it seems to me, but that White Leghorns are *as a rule*, the greatest egg producers in the world. If 50 selected pens of every breed were put in competition as egg producers, it is my opinion that the Leghorns would be found to produce the greatest number, though not perhaps the most in value, as the late Fall and early Winter eggs bring much the highest prices. Doubtless the rests which broodiness permits, cause this later egg production, and combined with the fact that the meat value of the American breeds is so much greater, the question of actual profit has yet to be worked out. The feed cost of bringing the larger breeds up to the laying point is undoubtedly greater, because Leghorns will usually begin laying at least a month earlier than the American breeds, and in localities their white eggs command a small premium.

Francis F. Lincoln's White Leghorns laid 2,088 eggs. Mr. Barron's White Wyandottes laid 2,085, and pen No. 42, the "sour milk" pen from Storrs Agricultural Station, laid 2,083. Mr. Barron's White Leghorns which got quite badly behind at the start finally struck their natural gait and crawled up on the winners until they also touched the 2,000 mark and made a score of 2,011.

In the score for the fifty-second, and last, week, the pen that scored first last week with a record of 33 eggs—Glenview Poultry Farm, R. C. Reds—make the same score of 33 again this week, and again take first place. But their total output is 1,478, while A. B. Brundage's S. C. Reds have laid 1,885—407 eggs more. Fred Benton's White P. Rocks tie with Dr. N. W. Sanborn's Buff Wyandottes for second place, each pen laying 29, and Colonial Farms S. C. Reds are third with a score of 28; Merrythought Farm's Wyandottes are fourth with a record of 26. The record for all the birds follows:

GEO. A. COSGROVE.

Hens in Poor Condition.

I HAVE 30 hens which I have been feeding yellow hominy, wheat middlings, bran, beef scrap and some potatoes, all mixed together wetted with sour milk. This I fed them morning and noon with corn and oats at night, also oyster shells. They have a good run with buckwheat out in the yard. I noticed some of them did not look well; after investigating I found there were big gray lice on them. I put kerosene and candle grease mixed together on them, now they have stopped laying and look worse than before. Was the kerosene to blame? G. G.

I do not think it likely that your use of kerosene and grease had anything to do with the condition of your hens. This is the season of the year when hens slack up in laying, or stop entirely and very likely the falling off in production is only natural. You do not mention any definite symptoms of sickness in your flock and lice are pretty sure to be in evidence on all fowls unless great pains have been taken to rid them of the pests. If the fowls have no means of dusting themselves frequently, you should provide them with a good dust bath. M. B. D.

Preventing Soiled Eggs.

ON page 1278 you publish a letter from W. B. with comments by M. B. D. which calls attention to the trouble which nearly all poultrymen have in preventing eggs becoming soiled in the nests. I formerly had the same trouble, but now have practically eliminated it. It is well known that the fouling of hen's nests is mainly due to the hens (and especially pullets) roosting on the nests at night, instead of on their perches over the dropping boards, as they should. I have my nests so arranged that the birds cannot get on the nests in the evening. The nests in my laying houses are underneath the dropping boards, open by hinged doors in front to gather the eggs, while the hens enter the nests from the rear, alighting first on two perches, two inches wide, two inches apart and 10 feet long, the length of each nest section. These perches are fastened together by three white pine battens which are connected with the bottom of the nest by six-inch strap hinges.

During the day these perches form a landing stage to the rear of the nests. When the last gathering of eggs is made at dusk any birds on the nests are driven off and the rear entrance to the nests closed by pulling up and fastening to a peg, a light chain which runs through a hole in the top of the nest front, under the dropping board, to the rear end of the centre batten of the hinged perches. After dark the ring on the end of the chain is released from the peg and the hinged perches drop by their own weight. The hens by this time are on their roosts for the night, and the nests are open whenever the hens are ready to lay. ROBT. MEADE SMITH.

Pennsylvania.

Hens With Bronchitis.

CAN you tell me what ails my poultry? Also what to do to cure the trouble? They cough or sneeze, have a rattling in the throat, look pale and seem to be very sick. They are not roosting in a draft, and are sleeping indoors of nights. I am feeding wheat only, for their grain feed. I keep dry bran before them all the time, with rye once a day for green feed. I fed the chicks wheat through the Summer, also dry bran before them all the time, also fed beef scrap in mash until a short time ago. I discontinued the beef scrap as some of the pullets were beginning to lay and I was afraid that would stop their development. As quick as the trouble appeared, I began to give them a little tincture of iron in the drinking water, but it seemed to do no good. E. A. E.

Missouri.

This trouble may be caused by bronchitis, or inflammation of the larger air tubes, independently of such catarrhal symptoms as running at the nostrils. Such attacks of bronchitis are frequent in the changeable weather of the Fall and are usually mild, vigorous birds recovering in a short time. When severe, the affected fowls may finally succumb to exhaustion, however. Such attacks of bronchitis are characterized by dullness of the affected fowls and a whistling sound during respiration. It is best to isolate the affected birds, giving them warm comfortable quarters and feeding upon soft easily digested food. A teaspoonful of castor oil to which ten drops of spirits of turpentine have been added may be given if it is desired to treat the birds individually. Birds that do not recover promptly should not be kept for breeders. M. B. D.

Double-yolked Eggs Will Hatch—Sometimes.

ON page 1171 you ask "Will double-yolked eggs hatch?" Yes, they will sometimes hatch, but very rarely; the supposed reason for their not hatching being that, usually, but one of the two yolks is fertilized, and the single embryo cannot absorb the two yolks, hence dies before the time for exclusion. One sure case of a double-yolked egg hatching was that of a Light Brahma egg on the farm of Mr. James Rankin, well known as the father of the Pekin duck industry, and this case might have escaped notice but for the fact that the two chicks were articulated together by the tip-joints of their wings. Mr. Rankin carefully separated the united wings, cutting the skin with a sharp knife, and tieing up the two wounds with a bit of cloth and string. Unfortunately the other chicks in the brooder discovered a drop of blood on the end of one of the bandages and pecked at it till they got the bandage loose, and the little victim bled to death; the other chick was saved and grew to maturity, but the wing that had been attached to the twin chick never developed much—it appeared to be withered, and gave the bird a curious lop-sided appearance.

I have heard of one other case of a double-yolked egg hatching twin chicks, but didn't have the opportunity to investigate and satisfy myself of the truth of the story; the Rankin case, however, can be relied upon. A. F. HUNTER.

"I've got just the horse for you," said a liveryman to a German farmer, who was a prospective customer. "He's five years old, sound as a bell, and goes ten miles without stopping." The German shook his head. "Nod for me," he said, "nod for me! I lif eight miles from town out, and mit dot horse I haf to valk back two miles?"—Credit Lost.

100 S. C. Buff Leghorns and LAKENVELDERS. Quick sale. E. SLATE, So. Hammond, N.Y.

PUBLISHER'S DESK

An agent of the Madison Square Company, 25 East 26th Street, New York, approached me recently with the suggestion that he had au houorable square and fair business proposition by which I could make some money. His company had a lot development at or near Bound Brook, N. J. He would deed me one lot free and clear, provided I would write them a testimonial letter like several others which he exhibited and allow the use of my name to induce other sales. In addition I was to pay the company $350 for au adjoining lot, worth $600; and all purchasers except the favored few like myself were to be charged $600 for the lots. My two would cost me only $175 each; and as a special suggestion to my cupidity I had the privilege of reselling at any price I choose. I might even sell them as low as $500 a lot and it did not take long to figure up the profits. He seemed disappointed when I told him I did not want to share in that kind of traffic. and he was really shocked when I told him that to do so, even if I could make the profits, would be a swindle on every person I influenced to buy. My letter would be a lie and a cheat, because others may rely on my judgment; and they would not know that I bought for less than one-third of the price asked them. Besides. I had no ambition to become a sucker myself. I knew right well that I could not get the lots on any pretense for less than they are worth, and I was satisfied that $350 was too much for both of his lots. Some years ago Ostrander developed lots at Lincoln, N. J., in the same section. A Michigan subscriber bought two lots, and paid $195 on them. He had $45 yet to pay, and asked us to look up the lots for him. I got an appraisal of $15 for the lots, but no market for them even at that price. I advised the Michigan investor to lose his $195. and save his $45 yet due. Several other experiences were along the same line and yet this agent carried letters from business men in the city, who undoubtedly paid more for the lots than any reliable appraisal would show them to be worth; but the most discouraging feature of it is that they thoughtlessly uo doubt permitted the use of their names to swindle others. I am not expecting any follow-up call from the Madison Square Company.

What can you tell us about the National Mercantile Company of Vancouver, Canada? They are offering farm loaus in some of the States at three per cent. interest. D. F.
Connecticut.

This is practically the same as the Standard Home Compauy of Alabama scheme, which has been exposed in THE R. N.-Y. for the past four or five years. As a result of that exposure, one of our subscribers in the South secured the complaints from us and turued them over to the local District Attorney and the officers of the company are now under iudictment. It will be remeubered that the Alabama coucern. like the Canada people, make their strong plea on an easy loan at low interest rates. The agents and advertising made it appear that the loan was sure; but the coutract said that the member was entitled to a loan after certain fees had been paid in, and when the member applied for the loan she was told she must wait her turn, and unless she kept ou paying the monthly installment, she would lose what had already been paid iu. A poor woman had paid in some fifty-odd dollars before she learned that she could uot get the loan, and feeling that she had been deceived, she refused to pay in more with no definite assurance that she could ever get the loau. We tried to get her money returned to her, but failed. A similar fate awaits the members of the Canada eoucern; but we have little fear that regular readers of THE R. N.-Y. will get entangled in these or similar schemes.

I wish to take advantage of this occasion to say that my feeble efforts to increase the circulation of THE R. N.-Y. have been made solely as an appreciation of the efforts you are putting forth to take care of *your* flock through the Publisher's Desk. Having been kicked and cuffed around the world since early boyhood, I am probably not much in need of such warnings or assistance, but it is probably that very experience that sometimes makes me think *your own* column is the grandest effort that today appears in print. G. K. B.
New York.

In a footnote the above writer says he writes in personal appreciation and not for publication. It is seldom we publish anything that reaches us under such circumstances, but there is no reasou to suppress this note except the writer's modesty and we think he will excuse us this time in taking liberties with his confidence. I use it because it confirms a conclusion that I long ago reached. That is that the man of broad affairs and information is the first to appreciate the protection that an honest vigilant and fearless publication may afford people with less experience and informatiou. I thiuk the friends of this department will bear us out in the assurance that we are striving for nothing unusual or spectacular. Such an attempt would make a work of this kind ridiculous. It was started with the hope of serving those who did not have the necessary information and means for their own protection. Its ambition is quietly to maintain this service from week to week.

A. and B. Howton, of Halifax, have entered suit in county court to recover $1,000 damages from the E. A. Strout Farm Agency for alleged deceit in misrepresenting a farm in Halifax which the plaintiffs bought through Hugh Agnew, agent at that time for the ageney, for $1,400. Mr. Agnew is made a co-defendant with the Strout Agency. It is alleged that May 28, 1913, they purchased what had been known as the MacLane farm, owned by E. J. and Minnie A. MacLane, for $1,400. The farm was represented to them as containing 95 acres, 500 apple trees in prime condition, and 100,000 feet of timber. They allege that the farm really contains only 65 acres, that there are only 125 old, scraggy, and rotten apple trees not in prime bearing condition and that there is only 25,000 feet of timber on it. The sum of $1,000 is named as the difference between the actual value and the value represented to them.—Vermont Messenger.

A later report states that the case was tried and the jury brought in a verdict for $550 in favor of the Howtons. The jury released the agent, Aguew, from responsibility, evidently holding that the company was responsible for the act of the agent. The burden of the Howtons' testimony seemed to be that they bought the farm relying on the represeutations of the agent and the deseription in the catalogue. It was also testified that the Strout Company sold the farm two years ago to Mr. MacLane, the seller now; and that it was at that time advertised under a differeut descriptiou. All of these trials justify our contention that a party to a contract has redress where misrepresentation can be shown by the principal or his agents, but those who wish to save themselves annoyanee and expense will get reliable iuformation from disinterested parties before they buy, and will then employ an attorney of their own selection to prepare the contract and seeure title to the property.

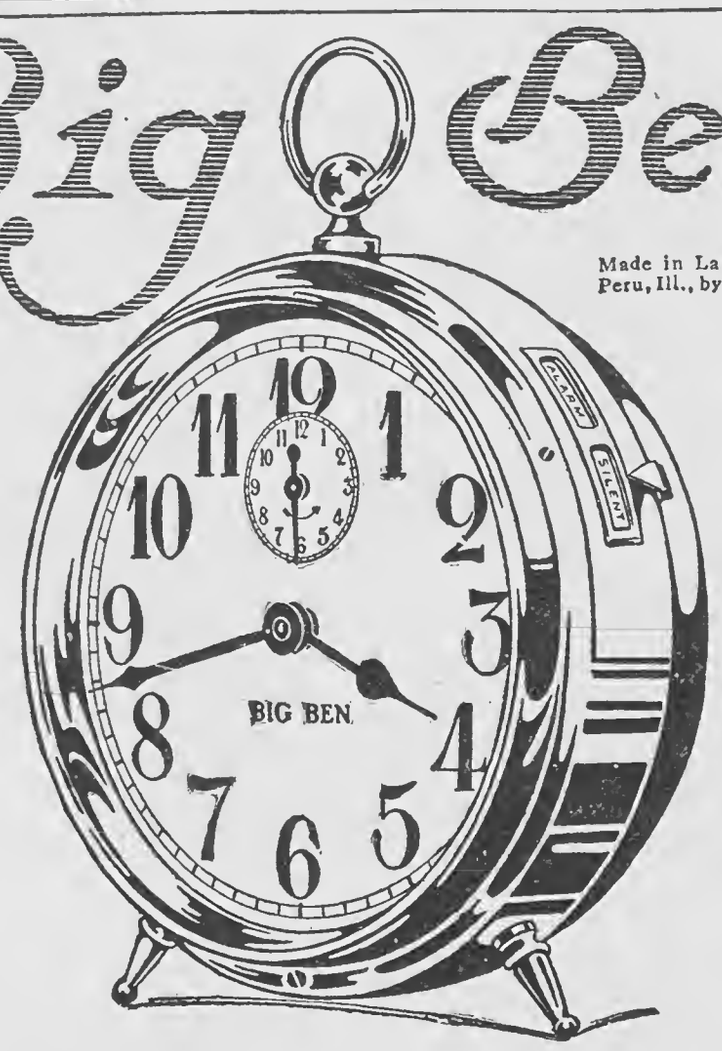
The Supreme Court has declined to direct the New York federal courts to annul the indictment against Jared Flagg, indicted with Daniel H. Morgan, ex-Treasurer of the United States, aud now ou trial in New York, charged with alleged misuse of the mails in selling stocks.—Washington Dispatch.

Flagg ran au investment scheme aud promised one per cent. profit a week, or 52 per cent. profit a year for money seut him for speculatiou in Wall Street. The indictment alleged fraudulent use of the mails, and the evidence showed that he uever used more than 10 to 15 per cent. of the money sent him in his alleged system of speculation in Wall Street, and what operations he did make were at a loss. The local trial resulted in a verdict of guilty on five different counts. We hope the repetition of these records from time to time will finally convince the people that these schemes of quick riches are gotten up not for their enrichment but as a painless process of extracting their hard earnings and frugal savings. J. J. D.

THE railroad station of Meridian, Tex., is about a mile from the business part of the town. One night a sleepy, weary, traveling man said to the darky who was driving him to the hotel: "Old man, why did they put this depot so far from town?" The darky scratched his head in thought and replied: "Waal, boss, I's fo'ced to admit dat I hasn't give de matter s'ficieut cogitation, but jes' jumped up for a answer like dis: I s'pose dey done dat so as to have the depot as near as possible to the railroad."—Credit Lost.

Big Ben

Made in La Salle and Peru, Ill., by Westclox



Built Like a Good Bull

He's as strong as an ox—look at his inner vest of tough implement steel, and his outer shield which serves also as his bell.

He puts in a full 24-hour day without a grumble—and he'll go 36 hours at a stretch without rewinding.

He's been working steadily for five years now and he's never worn out, so far as is known.

Hitch him to your sleeping schedule and see how much better the whole farm runs.

Big Ben stands 7 inches tall, handsome, well balanced, broad backed, honest looking.

His hands and numerals are big and black—easy to read on dark mornings. He rings two ways—five straight minutes, or every other half minute for ten minutes, as you prefer. You can shut him off in the middle of either ring if you wish.

In fact, his makers think he's the prize clock—the American People certainly have pinned the blue ribbon on him. $2.50 is his price—a pretty small price for a grand champion.

He's on exhibit at your jeweler's. If yours hasn't him, send a money order for 2.50 to *Westclox, LaSalle, Illinois*, and Big Ben comes prepaid to any address in the United States.

Products, Prices and Trade.

Wholesale Prices at New York.

Week Ending Nov. 6, 1914.

MILK.

The Borden milk schedule to producers for the six months beginning with October is as follows. This is per 100 pounds in the 26-cent zone. This is what is known as the "maximum" for milk testing 3.8 to 4.2 per cent. fat, and is 20 cents per 100 pounds above the "flat" rate.

	1914.
October	$2.00
November	2.10
December	2.10
January	2.05
February	1.95
March	1.90

Wholesale prices paid by New York dealers are running $2.01 and $1.91 for B and C. Hotels and restaurants using two to three cans per day are paying five to six cents per quart, single quart prices from bakeries and grocery stores, six to seven cents; delivered milk, nine to 10 cents.

BUTTER.

A scarcity of choice creamery has forced the price up one-half cent on this grade, and some slight improvement in market tone is noted in medium grades.

Elgin, Ill., butter market 32 cents.
Philadelphia, western creamery, 34 cents.
Chicago creamery, 26@32.

CHEESE.

Buyers are very critical, and with receipts large the tone of trade is toward lower prices. The slack demand for milk at many shipping stations in the Utica, N. Y., section has caused many factories to keep open longer than usual.

EGGS.

Storage stocks in this section November 1 were about 3,800,000 dozen in excess of last year. Uniform cases of new-laid white eggs are very scarce, occasional lots bringing up to 55 cents. The general run of gathered stock from good to choice sells from 30 to 36 cents, and storage 24 to 26.

FRESH FRUITS.

The surplus of cull apples has been reduced so that the market is in better condition, with advanced prices of 25 to 50 cents on some varieties. Grapes are in rather light supply, but many showing poor quality and prices irregular; cranberries still very low, as the holiday demand has not begun.

Chestnuts, Northern, bu	3 00	@	4 50
Southern	50	@	2 00
Hickory Nuts, bu	3 00	@	3 50

BEANS.

Medium and Pea are 15 cents per hundred higher. Red Kidney 25 to 50 cents lower, as export demand is light. Many people are prejudiced against this bean because of the dark color, but it is of high quality and especially good in combination with fried or boiled bacon. Growers of Red Kidney should make an effort to interest local restaurants in this bean, rather than depending so largely on export trade.

VEGETABLES.

The potato market is still burdened with low quality stock. Prices remain on the same basis as last week, though there are occasional sales a trifle higher. Sweet potatoes lower, especially southern. Onions in excessive supply and market very weak. Cabbage lower. Celery low. Lettuce running very poor. Peppers from the South scarcely bringing charges. Spinach and squashes selling slowly.

DRESSED POULTRY.

For two weeks the market has been overstocked with considerable poultry not good enough for profitable cold storage. Well fattened stock has been put quite largely into freezers to await holiday demand, which will be a fairly safe investment unless fresh stock for Thanksgiving is in large surplus.

HAY AND STRAW.

Hay declined 50 cents per ton early in the week, but advanced later because of the embargo on shipments of hay from sections where foot and mouth disease is prevalent. Alfalfa has been sold here this year, but the demand is only for the high qualities. Badly cured or otherwise inferior grades are not wanted merely because they are Alfalfa. Straw is $1 lower.

*

Our cotton exports during the week amounted to 65,000,000 pounds.

*

Norway buyers are said to be arranging for imports of 25,000 barrels of American apples, the home crop being short.

*

Business failures in this country for the 10 months ending November 1 numbered 12,969, with assets of $155,934,132 and $271,665,747.

*

There are now in this country 7,578 National banks, with authorized capital of $1,072,492,175, and total circulations of $1,121,468,911.

*

The total amount of incorporations in this country during the 10 months ending October 31 was $707,847,000, or about half the amount for same period of the two previous years.

*

Galveston, Texas, has received a cargo of California fruits via Panama Canal. The distance is 2,500 miles greater than by rail. Regular shipments are expected by this longer, yet cheaper, route.

*

In October we coined 8,565,859 pieces, valued at $6,672,051. There were 181,259 $20 gold pieces; 138,500 $10; 5,000 $5; 358,000 $2.50; 62,000 silver halves; 358,000 quarters; 6,400,000 dimes; 1,421,000 nickels, and 100 pennies.

*

As a provisional embargo has been placed on wool shipment from Australia, with the probability of similar action in New Zealand and South Africa, this country faces a shortage for many lines of manufacture. The domestic market is firm and in some cases higher. Recent sales at Boston have been at 23 to 24 cents for unwashed delaine, and 27 for quarter blood combing. There seems a fair probability that some of the embargoed Australian wool will reach our factories as raw material for orders from Great Britain.

Oct. 30. We have had a very fine month in which to do Fall work; some of it was too hot for the time of year. Frosts have been felt very little as yet. Oct. 27 the ground was white with snow; today has been rainy, we need a heavy rain fall for Fall plowing. Apples are a heavy crop in this section and are hardly worth handling; most of them are sold in bulk at 40 cents per cwt. or 20 per bu. A few are barrelling at $1.40 per barrel. Senator Wilsons apple-packing law does not take here as there is too much discrepancy between the price received per barrel and the labor consumed in packing. We believe in an honest pack but we cannot do it for nothing. Potatoes are yielding very heavily from 200 to 300 bushels per acre the price is from 25 to 30. Cabbage has dropped to $5 per ton. Wheat $1; oats 40; corn 90; barley 65; hay $13; Fowls 12; poultry 14; veal 10; hogs 8; lambs 7; butter 28; eggs 30. E. T. B.

Canandaigua, N. Y.

THE DAIRY SHOW.

(*Continued from page 1352.*)

tends to be judging for utility alone, and most of us are raising cattle for the money. The pretense is that the points on the score card are looking toward a utility animal. Obviously they are not, and if portions of the score card are for beauty and others are for utility, why not be perfectly frank and say so? Why not say we want a face dished just so for beauty, instead of pretending that the dish has anything to do with the ability of the animal to produce milk and butterfat economically? The tortuousness of the milk veins and their size varies with the period of lactation. This is probably due to the gradual decrease in blood pressure to the udder as the lactation period progresses. Then, why should a cow that is nearly dry be relegated to fifth or sixth place because her milk veins are not as large or as winding as the cow that came in two weeks ago?

SPRING OF RIB.—Quite a bit of stress is laid upon spring of rib. What makes spring of rib? Is it an inherited quality or does it vary with the condition of the animal? It may be inherited to some degree, but I have a hunch that it varies with the conditioning of the animal. When a slat hammock is empty, it doesn't have much spring of ribs, and they are close together but the moment two or three fat men get into it, the slats have a great bulge and they are farther apart. It looks to me as though this applied to a certain degree with the animal. Fill her up and the spring of rib is increased. Is this reasonable and right? If not, the one who can prove that it isn't has the floor. M.

WHEN you write advertisers mention THE R. N.-Y. and you'll get a quick reply and a "square deal." See guarantee editorial page. : : : :

Subscribers' Exchange

Complying with several suggestions received recently, we open a department here to enable RURAL NEW-YORKER readers to supply each other's wants. If you want to buy or sell or exchange, make it known here. This Rate will be 5 Cents a word, payable in advance. The name and address must be counted as part of the advertisement. Copy must reach us not later than Friday to appear in the following week. No display type used, and only Farm Products, Help and Positions Wanted admitted. For subscribers only. Dealers, jobbers and general manufacturers' announcements not admitted here. Poultry, Eggs and other live stock advertisements will go under proper headings on other pages. Seed and Nursery advertisements will not be accepted for this column.

YOUNG MAN, 17, studying farming, desires position on well-conducted farm; no experience; willing to learn. D. G., care Rural New-Yorker.

WANTED—March 1, capable married man to work on farm by the year; wife to board help; experienced; references required. C. A. J., care Rural New-Yorker.

WANTED—Position assistant poultryman, would assist with books, or anything on farm; good bookkeeper; strictly temperate; non-smoker. R. H. O., care Rural New-Yorker.

NOTICE—On or about Jan. 1, 1915, a first class farm manager or superintendent will be open for engagement; American, age 39, qualified for any proposition. For particulars address Box 73, Silver Creek, N. Y.

RESPONSIBLE position wanted, Dec. 1; wide experience in farm management and full college training; ability and character attested to by responsible persons; married; 35. Address L., care Rural New-Yorker.

POSITION WANTED—By an agricultural school graduate as superintendent of a farm; understands farm crops, stock, dairying, poultry, farm management; single; best of references. Box Z, care Rural New-Yorker.

WANTED—Position as farm manager, dairy and grain farm, understand all modern methods of farming, butter making, testing, feeding and handling men to best advantage; best reference. Box 218, Stockbridge, Mass.

POSITION WANTED—By an agricultural school graduate as poultryman; understands the care and feeding of chicks and layers in large numbers, mammoth incubators and brooders; five years' experience; single; best of references. Box 74, North Chatham, N. Y.

WANTED—Partner, worker to put $1,000 additional working capital in high-class poultry, truck and fruit farm; 25 acres in wealthy suburb of New York City; home market for everything; high prices; big opportunity for experienced hustler take full charge and half profits. N. A. F., care R. N.-Y.

POSITION WANTED—By working farm foreman, not afraid of hard work, who understands farm, garden, poultry, cattle, with ability to make good; at present employed; would like a change; Scotch, aged 39 years, married, no children. SCOTCHMAN, care A. E. Wheeler, 166 West 23d St., N. Y. C.

ALFALFA HAY—F. P. ERKENBECK, Fayetteville, N. Y.

NEW HONEY—Basswood or clover in sixty-pound cans; write for prices. C. A. HATCH, Richland Center, Wis.

APPLES, APPLES, APPLES—For choice sprayed Winter Apples. Please order to-day. C. J. YODER, Grantsville, Md.

ALFALFA FOR SALE—Fifty tons first cutting, thirty tons of second cutting, all cut early, well cured, bright and pea green; have sold farm and must dispose of Alfalfa. JOHN McLENNAN, Fayetteville, N. Y.

LIVE OYSTERS in the shell, $2.75 barrel; nice yellow sweet potatoes, $2.50 barrel. Thanksgiving is coming; order now; would exchange few for fancy apples, such as Kings, etc. WM. LORD, East New Market, Md.

GRAPEFRUIT AND ORANGES by express in half or whole boxes, F. G. B. Miami, Fla.; fancy brights at $1.75. Golden Russets at $1.50 per box, with order; delivered prices quoted on request. GEO. B. CELLON, Tropical Grove, Miami, Fla.

FOR SALE—Fully equipped poultry plant in San Joaquin Valley, Calif.; particulars free. O. C., care R. N.-Y.

FOR SALE—Farm 85 acres, 65 wide, cultivation apple and peach orchards, one-half mile of depot and town of 1,000 inhabitants; bargain to quick purchaser. HANSON S. PHILLIPS, Hebron, Md.

IMPROVED small farm in two-crop Virginia region for sale, account husband's death; suitable for peanuts, hogs, truck, grain; New York markets; mild winters. MRS. ELEANOR HURTLEFF, Claremont, Va.

FOR SALE—200 acres dairy, fruit and vegetable farm, one mile from City Hall, sidewalk and electric light to the farm; a good paying proposition or would make an ideal summer resort for city people; full description and price. Address OWNER, Box 277, Montpelier, Vt.

LONG ISLAND FARM FOR SALE—75 acres; one-third cleared, one-third young growth, balance big oak timber; fair buildings, small orchard; adjoins the country home of Chief Justice Bartlett, N. Y. Court of Appeals; 60 miles from N. Y. O. B. ACKERLY, Yonkers, N. Y.

$80 PER ACRE—Productive, highly cultivated 82-acre farm, located at city line, Corry, Erie County, Pa.; good house, fine bank barn, two silos; right at splendid city market, schools, churches, roads, etc., finest water; produces immense hay, ensilage, pasture and other crops. JOHN I. COLEGROVE, Sheffield, Pa.

FINE RIVER FARM FOR SALE—The George Stratton farm, located at South Oxford, Chenango County, New York; situate one mile from Coventry station on the Lackawanna Railroad, and six miles south of Oxford, will be sold at public auction on Thursday, Nov. 12, to close an estate; farm comprises 375 acres, is well watered from springs and has fine buildings all in good condition. The residence cost $6,000 to build, and the cow barn $4,000. Will be sold in two ways, in parcels or as a whole, whichever will bring the greater price. Farm contains 50 acres of timber, consisting of pine, oak and chestnut. Four years will be given for removal of same. Lake Warn is located on the farm. Possession given March 1. For further information address CHARLES W. BROWN, Oxford, N. Y.

I'll Rid Your Stock of Worms

I'll Prove It Before You Pay

I Want You to Know The Value of SAL-VET

—I want you to feed it at my risk—I want to prove to you on your own farm that SAL-VET will rid your stock of worms, put them in healthy condition, easier to keep on no more feed—more profitable in every way—and less liable to disease. I don't want you to send me a penny in advance—just mail the coupon. I'll ship the SAL-VET just as agreed; let you feed it 60 days—and if it does not do what I claim, then I'll cancel the charge. Is not that a fair, open offer?

TRADE MARK

SAL-VET

REG. U.S. PAT. OFF.

The Great Worm Destroyer

The Great Live Stock Conditioner

—is the medicated salt which contains no antimony, fed just as you would feed common salt. There is no dosing—no drenching—no trouble—all animals need it—take to it readily—and so doctor themselves. You will find animals that you do not suspect of having worms just full of them. Stock that have been run-down will take on new vigor, grow thrifty and profitable. Stock kept free from worms will be healthier; will do better, act better, and be in better condition to resist dangerous diseases. As proof of this read a few of the thousands of letters from stockmen who feed SAL-VET—who depend on SAL-VET to help them make greater profits—and to prevent loss.

READ!

"Before I started to feed SAL-VET my hogs were sick, and I had lost six of them, since feeding SAL-VET I have lost none, although some of them were pretty sick before they had access to SAL-VET and had lost their hair. However, they pulled through all right and now have good appetites and are thriving."

ERNEST TRIEBEL,
Route No, 2, Clearwater, Minn.

"After feeding SAL-VET to sheep, hogs, horses and cattle during the past winter, and found it a reliable conditioner and worm destroyer. My stock never looked so healthy and thoroughly conditioned as now."

U. H. SUMMER,
Brownville Jct., Maine.

"My hogs are doing finely; have kept SAL-VET before them for two months and while there has been lots of disease amongst hogs in this section, none of mine have been sick."

GEO. A. ELINE,
Route No. 20, St. Matthews, Ky.

"I have fed SAL-VET to all my stock; it has put them in fine condition, and improved them wonderfully. The cholera has been killing hogs all around my home, but I have not lost a single one. I have never used so effective a remedy."

SANFORD GERST,
South Boston, Va.

"I enclose check in payment of the SAL-VET sent recently. Four times this sum would not begin to pay for the benefit I derived from feeding SAL-VET."

W. H. WALLACE, Franktown, Va.

"I have great faith in SAL-VET. Since feeding it, I can certainly see a great improvement in my stock. I have fed a number of different stock foods and remedies, but have never found any as good as SAL-VET. I am recommending it to my neighbors and others who lost hogs with the cholera."

C. G. FIELD, Hiawatha, Kansas.

READ!

"I am feeding SAL-VET to 750 lambs and about 100 hogs. During this time there has been no sickness whatever among this stock. I consider SAL-VET cheap insurance."

THOS. J. LILLY, Wheeling, Mo.

"SAL-VET is certainly a great medicine. I have been feeding it all winter, so far and since I started, my stock are better than ever before."

ALBERT MEANS, Walthill, Nebr.

"Have been feeding SAL-VET to some of my horses which were very thin and in a run-down condition. They have now picked up in flesh and spirits in spite of the heavy work incident to this time of year."

ELI FURLAND, Artesian, S. D.

"I had a yearling colt which was not doing at all well. I had fed turpentine, tobacco and other worm remedies, but all failed. On the evening of the 19th of February, I gave this colt a dose of SAL-VET and the following day I had plenty of evidence of its value. It is doing the work all right."

HARRY BRENNEMAN,
Rt. No. 5—Ottawa, Ohio.

"I am well pleased with SAL-VET. I never knew a horse could have so many worms and live. SAL-VET surely brings them—big and small. Horses to which SAL-VET is fed, act 100 per cent better, and what we formerly thought was colic and meanness, was nothing but worms and worms."

J. E. TERKEURST,
271 Dauphin St., Mobile, Ala.

"The more I use SAL-VET the better I find it. My sheep and hogs were never so thrifty and healthy as now. We butchered this week, and did not find a single worm, while our neighbors' hogs are wormy and dying. I have been recommending SAL-VET to them and they are now ready to use it too."

WESLEY CHAMBERS, Bussey, Ia.

Look for this Label

on all SAL-VET packages. Don't be deceived by imitations. Don't buy "Sal" this or "Sal" that. Get the original genuine **SAL-VET.**

Fill Out the Coupon Below Today

You take no risk whatever in accepting this no-money-down offer. Just fill out the coupon, tell me how many head of stock you have, and I'll ship enough SAL-VET to last them 60 days. You simply pay the freight charges on arrival, and when the 60 days are up, report results. If SAL-VET has not done all I claim, then I'll cancel the charge, and you won't owe me one penny. Address

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

Cornell University Library 26214

:: Facts About the Land Bank ::

THE literature sent out by the Whitman campaign committee and published in the county papers said that the farmer would be required to pay the loan association, according to the Governor's own figures, $135.86 each year on a loan of $1,000. He must pay this in equal monthly installments. If he fails to make his monthly payments promptly he will be fined. Twelve payments every year must be made regardless of weather, crops, sickness or difficulties of any kind. It also said that the Land Bank will impair the saving and loan associations, and reduce them to the condition of the old national associations through which people lost their money. Will you tell us about this?

New York. H. H. G.

Under the Land Bank system when the interest rate is five per cent., a $1,000 mortgage will be liquidated in about 11 years, on an annual payment of about $110, and not $135, as stated. This includes both interest and payment on the principal. For a 40-year mortgage the annuity would be about $60. Then again, the man who says the payments must be made monthly or suffer a fine either does not know what he is talking about or wilfully misrepresents facts. Under the Land Bank system, payments may be made weekly, monthly, quarterly, semi-annually, or annually.

The average loan now on New York State farms pays six per cent. interest, and if cost of revenue is considered it probably runs above this rate. Some mortgages in the State have been in existance 70 years. When one stands for 40 years, the farmer pays $60 a year for 40 years on every $1,000 of the mortgage, and the face of the mortgage must then be paid in one bulk sum.

In Germany and France the farmer pays 5.2 per cent. per year for 40 years and the mortgage is then wiped out, and the farm is free and clear. What is true of farms is equally true of the town home. The Land Bank system simply tries to bring the German and French cooperative credit system to the farm and the home. We will undoubtedly have to pay a higher rate for a while, because interest rates here are higher, but the higher the rate the greater the advantage from the amortization features. When our system becomes established and the soundness of the Land Bank bonds are appreciated, they ought to sell at as low a rate of interest as national or State bonds, and when they do, the rate of interest to the borrower will be reduced accordingly. This is what the money lenders do not want. It is what attorneys who handle money for loans do not want. Men with money to loan have been able to exact high rates from small farmers and small home owners because large institutions do not care to make these small loans. These loans are made for short periods, and with each renewal there are bonuses for the lender and extra fees for the lawyers. I come pretty near knowing what I am talking about. Last week I wanted a three-year renewal of a mortgage, and the lawyers refused to renew it for less than a bonus of $600. Reinforcing this I have the recollection of bonuses and expenses connected with my father's farm since boyhood.

The money lenders and lawyers who oppose the coöperative credit system are the stumbling blocks that always obstruct the road of progress. Some of them do it cunningly and selfishly; others because they cannot see ahead. Both classes fail to understand that any system that helps the producers and the toilers and builds up the neighborhood in which they live cannot fail to benefit themselves also. Coöperative credits will ultimately benefit these opposing classes in the same measure that it will help the producer and the mechanic; but even if it did not, it would not be any calamity if some of them had to go to work.

It is unfortunate that this coöperative credit movement came up at a time when it figured as an element of politics. As a matter of fact the people recognized no politics in it. The three leading national and State parties recommended it in their platforms. Just before the last national election President Taft advocated it for the whole nation. Governor Glynn's favorable activities resulted in the first coöperative system in New York State that has yet been adopted in this country for mortgage credits. The hysterical opposition was not against the measure or the principle, because the criticisms showed that the critics had not studied either, and understood neither the law nor the principle. In reality the effort to discredit the system was the best assurance of its merits. Knowing its possibilities of good, they feared that it would make votes for Governor Glynn, and for that reason they felt the necessity of opposing it. In reality a Republican Assembly passed the bill creating the Land Bank, under pressure from farmers and home owners of all political tendencies; and a real honest policy would have been to support it and demand their share of credit for it. We make this plain now because some readers are evidently confused by the arguments pro and con for political effect, and we do not want farmers to have any illusions about farm mortgage coöperative credits. A sound safe system of credits cannot be built up in a few months. It cannot show its possibilities short of years of patient development. But the development may begin at once, and benefit will be immediate and substantial. When the Land Bank of the State of New York has developed to its full possibilities the people will appreciate its benefits as they are now unable to do, and Governor Glynn will need no other monument. J. J. D.

SELLING A CARLOAD OF POTATOES.

"Happy Days" in Buffalo.

THE COMMISSION MAN'S DEALINGS.—The past Spring, not feeling satisfied with the difference in price of potatoes offered here by buyers, and those quoted in the Buffalo markets, I wrote to two commission houses in that city, making inquiry as to the actual condition of the market. The next morning I received a telephone call from one of the firms, whom I will call John U. Dont, saying potatoes were worth 85 cents per bushel and that they could handle them to good advantage. The following day, I think, a letter came from the other firm, saying potatoes were worth about 75 cents, but as their business was mostly in fruit they could not handle to good advantage. We sent samples of both varieties to John U. Dont, and began loading the two cars of potatoes. Upon receiving samples John U. Dont wrote us that they could handle the potatoes to good advantage, making as a further inducement the statement that potatoes were worth 85 to 90 cents per bushel. When this letter came I was at the depot waiting for train to Buffalo, the first car already shipped and the second partly loaded. Fortunately the potatoes were not consigned to John U. Dont, as while he appeared to be a clean, honest man himself, his potato business was in charge of a man who leaves anything but pleasant recollections to one struggling in a strange city to do the best he could with his crop. Notwithstanding the fact that he had so recently written us after receiving the samples, that he could handle them to good advantage at 85 to 90 cents per bushel, supposing he had me in a tight place, before he even saw the potatoes in the car, he began finding fault because we had not shipped them the week before, and said that 60 cents was the best they could get for them then. From this would be deducted six cents commission and also cartage, which I think was about three to five cents per bushel. The matter was all treated in a cold, hard, I suppose one might say "business" way, caring nothing for the fact that he had done all he could to get us to ship to him, with his glowing promises, simply assuring me that I would have to take my medicine, which I did, and the one dose from him was enough. It is the operations of such men as this who hurt the commission business, for they are far from being all alike.

THE OUTSIDER AND THE SYSTEM.—I spent over a day visiting large grocery firms, hotels, and then the smaller grocers, and in doing this it was not possible to overlook the system an outsider is up against in going into that market. Of course, it was impossible to consider reaching the consumer direct; in the first place on account of the time required, and next that a license is required to peddle, or still more expense to fight it, and above all the fact that Buffalo women have telephones and use them. I think I am correct in saying that the private telephone exchanges in some of the large department stores in Buffalo, who have grocery branches, have more girls employed in answering calls than are to be found in the telephone exchange in many large towns.

THE FARMERS' MARKET.—Buffalo has its farmers' market, of course, but the small proportion of farm produce that goes direct to the consumer is only too evident. A few large growers have their regular stalls the year round in the smaller market up-town, but as near as I could see, a large part of the stalls were occupied by those who bought their goods. Business in the big open Elk St. market, which is really the only farmers' market there worthy of the name, is mostly over too early in the morning for the majority of the women of Buffalo to be out. The farmers' wagons, auto trucks, the latter much in evidence, were to be found lined up to the curb at 5 A. M. or before, and as one goes down from the hotel before that hour, he is passed by an occasional horse-drawn or auto delivery grocer wagon, heading for the Elk St. market also, but it is a fact that not even all the grocers buy at first hands. The small proportion of the produce sold on the Elk St. market, that goes direct from grower to consumer, is not worth mentioning, judging by what I could see. Jobbers seem to do a good business buying of the growers and delivering to grocers, and the hucksters sell a great deal of it. With such commodities as potatoes, of which such large quantities are used in Buffalo, the proportion sold on the Farmers' Market is probably quite small.

THE CREDIT SYSTEM.—The credit system is at the bottom of the whole trouble in going there a stranger to sell one's own produce. The commission men and jobbers trust the grocers, and the grocers carry the consumer, and the consumer pays the bills. Too large a proportion of the business so far as the cost of living is concerned is done by 'phone and the expensive delivery system. The large department stores and grocers cannot maintain for nothing the long rows of delivery vehicles one sees early in the morning drawn up to the curb or waiting for a load. The man who goes to Buffalo, or perhaps it is the same in any large city, to sell one or two cars of any produce, is under a handicap he has not figured on, for he must, unless his product is scarce and in strong demand, sell cheaper to the grocers than they can buy from the jobbers and commission men, who have been supplying them regularly. As one buyer in the grocery branch of a large department store expressed it, "It would be hardly fair for me to buy this car of potatoes of you, and turn down the man who has been taking care of our business regularly, delivering a load on 20 minutes' notice, sometimes, if I run short, or during freezing weather." And at a time when the grocers were not carrying a large stock, depending on the jobbers and commission men to deliver in small quantities, the problem was especially difficult.

EXPERIENCE WITH HUCKSTERS.—After studying the situation carefully, and being determined to do better than John U. Dont's man on the basis of 50 cents per bushel or less, net, above cartage and commission, I went early one morning with a sample bushel of the potatoes to the Elk St. market, and it seems that in less time than it takes to tell about it, I was surrounded by what now sticks out in memory as a "howling mob." I supposed they were Italians, but they proved to be Jewish hucksters. One man grabbed the bag, threw it into his wagon and I followed. He wanted to see the car of potatoes, but before he could get started there was a partner who had a lot to say and there seemed likely to be a fight. I attempted to withdraw, and I heard them say to one another "fraid," but it was only their way of yelling at the top of their voices, not pleasant to remember. We finally got to the car and sold one of the gang a few bushels and the news seemed to spread, for I had more experience in the next few hours than I care to go through again. In one case I sold a man a few bushels at 75 cents per bushel at the car, and before he got away another bought half the carload at 70 cents. When the other fellow's load was weighed he refused to pay more than 70 cents, as I had sold to "mein brudder" at 70 cents for the big lot, and rather than stand and be yelled at, I let it go. Big Sam who bought the half car kindly warned me against some crooks who wanted the rest of the car, doing it on the sly, however, for while they were near he assured me they were good fellows. He told me, as I afterward learned to be true, that these fellows work in pairs; one goes to the car and gets a load in sacks, and between the car and the public weigh scales as many sacks as they think will not be noticed are transferred to the other wagon. The same crooks were at the public scales as a grocer wagon drove past, and seeing I was a stranger the driver warned me to keep away from them. After Big Sam had given me much valuable information as to these methods of the other fellows, and invited me to his house to attend his daughter's wedding the next day, he proceeded then to try to do me himself in his own and an entirely different way.

THE SQUARE COMMISSION MAN.—That was enough for me, a stranger, single-handed, trying to deal with such people, watching this one and that one, and in danger of being tricked at every turn. I went to James T. Pensquare as we will call him, a commission man highly recommended by the buyer at one of the large department stores, then handling about 1,000 bushels of potatoes per day with his auto truck, and turned over to him to finish delivery of those sold together with the balance of the car, also the second car then on the way, with the result that he proved a friend indeed, for after deducting his commission and cartage he returned to us 75 cents per bushel for the very same potatoes John U. Dont's man would have returned but about 50 cents per bushel. While the experience was anything but pleasant, I was glad to have had it, especially as the returns for the two cars were about $200 more than the local buyers offered, and we now have 1,500 bushels in cellar for which we hope to find a market where we can meet the consumer face to face, if we can find such a place. I. C. R.

LOCAL MILK CONTESTS.

A FEW months ago THE R. N.-Y. suggested local milk contests. The plan was to get the local farmers who supply milk to a town or city to compete for prizes, the object being to increase interest in the local milk supply and encourage the production of clean milk. The first response to this that we have heard of comes from Schuylerville, N. Y. Dr. T. E. Bullard was largely instrumental in organizing such a contest at the Local Grange Fair. Prizes were offered for the best and cleanest milk, and Dr. Bullard was put on the committee which awarded the prizes. The milk had to be at the hall by 11 A. M. There was only one test for its cleanliness, and that was the result of a bacteriological examination. It was thought that the number of bacteria found in a sample of milk at a certain age would be the fairest test of its quality. There were 15 samples submitted, each sample consisting of two bottles. One bottle from each lot was taken to the Warren County Laboratory. All labels or marks were removed, and the milk examined by its number, so that there could be no favoritism through knowledge of the dairymen who produce it. The milk was then examined by scientific methods and the results were reported. Westfield Brothers of Saratoga Springs took first prize, their sample containing only 25,000 colonies of bacteria. C. A. Hall of Greenfield Center came next, with 30,000 colonies. Then came John E. Leonard of Saratoga Springs, and J. M. Eddy of the same place, each with 40,000 colonies, and these two divided the third prize between them. Other samples were nearly as good as these four, and all would rank as high-grade milk. This contest shows that at least some of the milk supplied to Schuylerville patrons is exceptionally good. It forms a first rate way for milkmen and patrons to get together and know each other through the milk, and certainly the man standing well in a contest of this kind wins advertising which is sure to prove very valuable. These local contests ought to be encouraged, and they would make a most interesting feature of many a local fair.

GROWING ELECTRIC LIGHT AND POWER

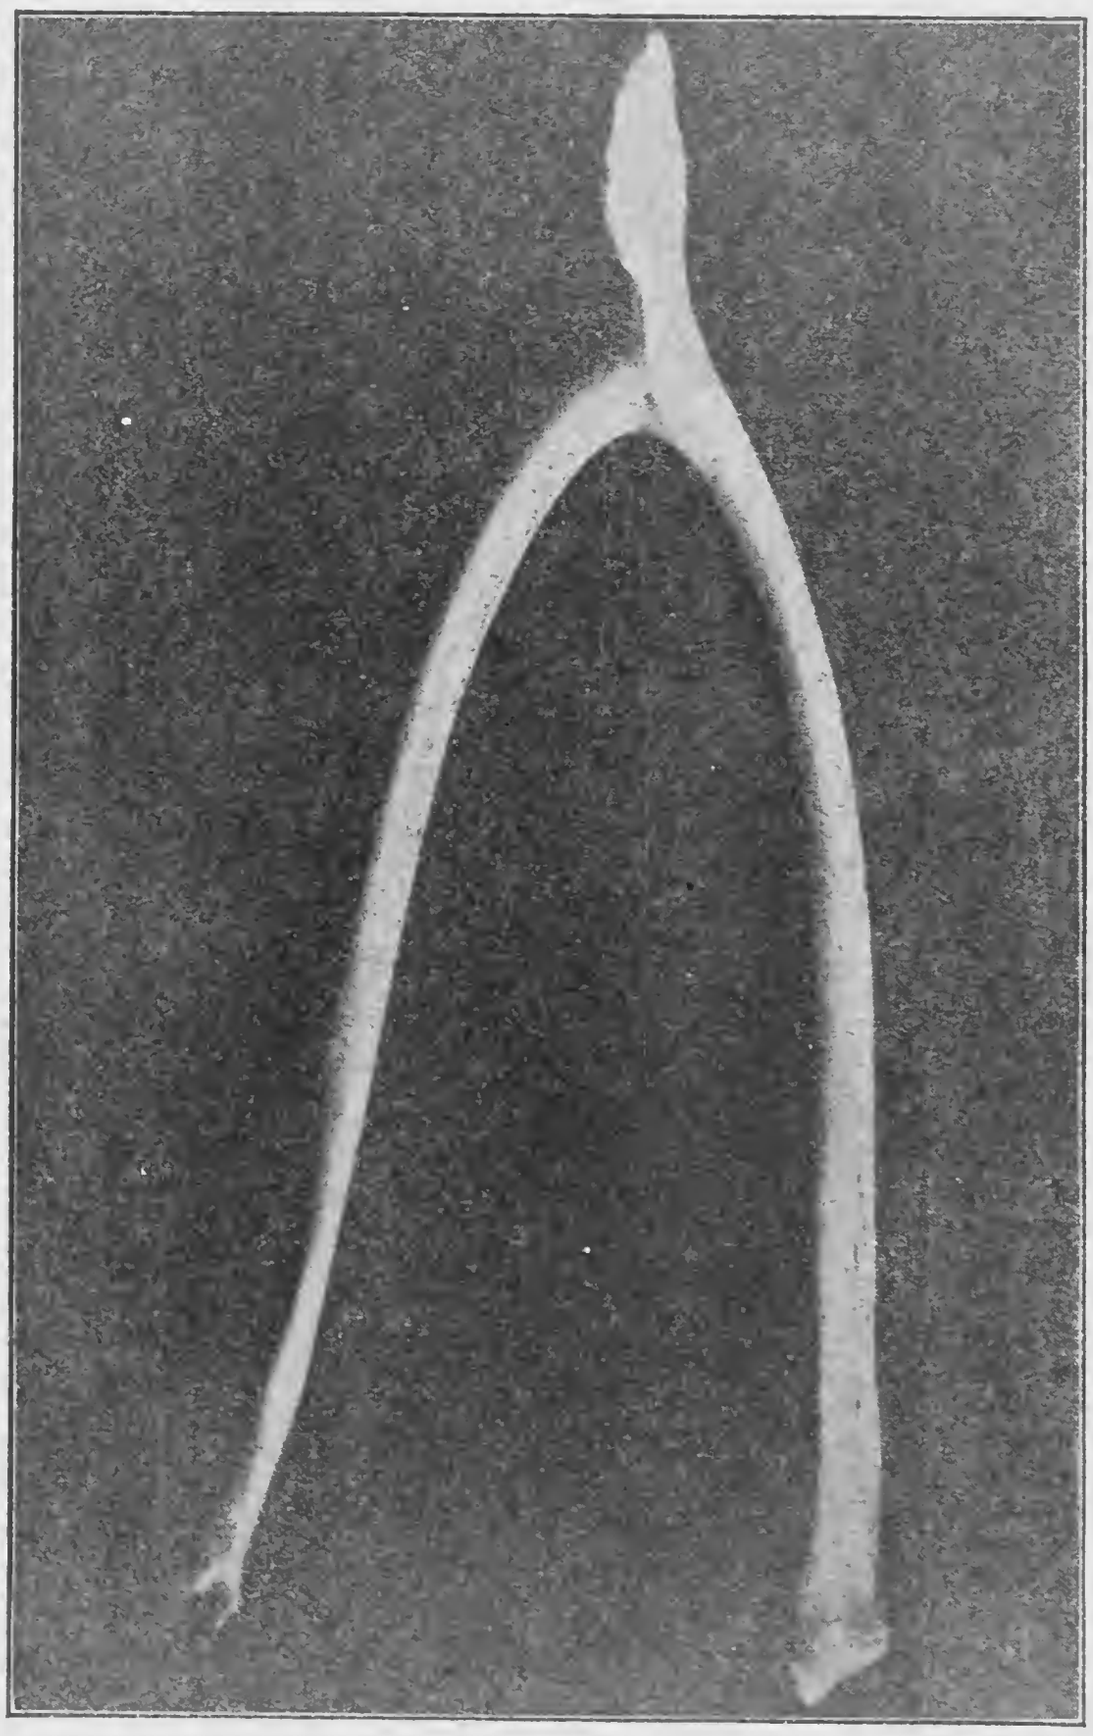
Where Hard Cider Grew Before.

THE IDLE WATER-WHEEL.—One of my neighbors, like many New England farmers, has a water-power "privilege," as they call it here in Massachusetts. It was developed a long time ago, and had fallen into some disrepair; recently it had ground cider, planed lumber, and did other lazy jobs when called on; but usually it was idle. In Winter, however, it was necessary to keep the wheel running slowly, to avoid its being damaged by ice from an accumulation of water seeping from the race, so it really was not paying its keep. His power consisted of a 14-foot fall with a 36-inch turbine wheel of the usual style. In repair it should develop about 35 horse-power. I suggested to him that if he would put his wheel in repair and keep it in running order, I would put in an electric generating plant, so that we two could have electric light for our houses and barns, and such small power as is needed about a farm, for churning, separating, washing machines, etc. He accepted eagerly and at once put his wheel in shape so that it could be depended on to run steadily and deliver power at a certain number of revolutions per minute. This is an absolute necessity for electric light—constant speed.

MATERIAL REQUIRED.—I found a second-hand dynamo in New York, a "compound" machine rated at 110-125 volts, direct current, of 5.75 kilowatts capacity, at 1,550 revolutions per minute. A kilowatt is 1,000 watts; a horsepower is about 750 watts, so this machine was capable of delivering about 8 horsepower without overloading. Modern machines can be overloaded 50 per cent. without harm, and will stand an overload of 100 per cent. for a few minutes. The power required to drive a dynamo depends on the amount of electricity used. One ordinary light requires about 45 foot-pounds motive power to keep the machine going; 12 lights require about 550 foot-pounds, or one horse-power. When a machine is running idle, it requires only enough power to turn the shaft in its bearings. It is good engineering practice, if one had a surplus of water power, to figure on two water horsepower, for every 12 lights, or their equivalent, used. This gives a big margin, and insures steady speed. If the speed goes down the lights go down, and vice versa.

CAPACITY AND COST.—To give another idea of the capacity of this machine, it will light, at normal load, 125 old-style carbon lamps, of 16 candle-power each; or 250 new-style tungsten lamps, of 20 candle power each. This, of course, is greatly in excess of our requirements, but it gave us a big margin to work on, for other purposes. The average farmhouse can use about 12 lamps in house and barn. These 12 lamps will make the place as light as day, and make any ordinary lamp cast a shadow. The machine cost $90, together with the necessary regulating appliances. A machine of half the capacity can be picked up for less than half this sum; and, in cases where a farmer wants light only, he could find a one kilowatt machine, second hand, around $30, that would give him twice the light he needed.

POLES AND WIRES.—My house is 2,000 feet removed from the power plant, and my neighbor's house is 1,000 feet away. We cut telephone poles in our own wood lot and set them, and strung transmission wire, without much difficulty. I used No. 6 weather-proof wire on my line, and he used No. 8 on his. This wire should cost about $19 per 100 pounds weight. As a matter of fact both of us were able to find second-hand wire, so our two lines cost us under $60 complete I wired my own house, and although I had never had experience at this task, I did a job that readily passed insurance inspection. In fact, because of my desire to get things right, I probably did a more careful job than the average electrician would have done, following the insurance-code requirements to the letter. I used the usual wooden moulding, to be had for about two cents a foot. When my house was finished, I gave my neighbor a lesson in the art, and in a day or two we were ready to start the machine and turn on the juice. There had never been electric light in our section, and the neighbors had some doubts as to our ability of turning falling water into light. There is no doubt in their minds now, and they are all following suit, as most of them have antiquated power privileges which they are scouring up for the purpose. The sole excuse for these water wheels living heretofore has been to grind hard cider in the Fall. You can draw your own morals for the new order of things.



Our Wish for You is for Good Luck, Good Spirits and Good Digestion. Fig. 587.

HOUSEKEEPING HELPS.—At first we ran the electric plant only at night. Now, however, we keep it going 24 hours a day, which means that at any hour of the day or night we have an abundance of clean, cool, safe light anywhere we want it; and in addition, our wives have electric irons (which save them walking 10 miles a day on ironing day); electric toasters, electric water boilers, and other "fixings" which the frugal farmer is supposed to be denied. The best thing we have done at my house is to install an electric range, in place of the old wood range. A city friend of mine put in this range at his house, but found the cost of commercial current prohibitive, so he sold me the range for 30 cents on the dollar. It has an oven big enough for four loaves of bread, and three hot plates on top. It confines all the heat to the stove, bakes with marvelous evenness, the "fire" is "built" merely by turning a button, and put out by the same process. It is always ready, makes no ashes, costs nothing to run (as we have more current than we can use) and makes the kitchen a place of joy on a hot Summer day. My neighbor, in addition to lights in his house, has city street lights in his barnyard, and his horse barn and cow barn look like an electric show. When he goes out to do his evening chores, he does not go in the dark. At the kitchen door is a switch, one throw of which makes the barnyard as light as day. Think what this means when a team comes home from town late.

COST INVOLVED.—Now as to the cost of this luxury and convenience. The electric plant—wire, fixtures, dynamo, switchboard, everything, cost $225 for the two houses, and we have enough surplus current to light a dozen houses, and fill farm kitchens with conveniences. That is $225 as the first cost. To keep the plant running 24 hours a day costs only what lubricating oil is consumed. You can figure this for yourself. We can't use more than eight horse-power from the water wheel, by the wildest extravagance in using the "juice." So we belted the jack-shaft back, and run the dynamo from a countershaft. The main shaft runs at 150 revolutions per minute, about one-third speed. The oil cups on the main shaft have to be attended about once a week; and as the dynamo shaft runs in oil, it requires very little attention. Beyond this, the only attention required is to keep the machine clean and free from dust and dirt. Frequently no one sees the machine for two or three days, but it is giving service any minute it is called on. A dynamo is merely a spool of wire rotated between a set of magnets, so there is nothing to wear out; and modern machines are protected by safety fuses, like safety valves on a steam engine, so there is no chance for a fool-killer to damage the machine itself.

POSSIBLE DANGERS.—Now, as to the danger. Electricity to the average man, is a thing of terror There are no barn lanterns to kick over, no kerosene to catch fire—but, there are "live" wires. Let us see how dangerous this live wire is. My farmer friends, once they got used to see me handling bare wires with impunity, wanted to try it themselves. The funny part of it was that their hands were so covered with callouses that they could not feel the current at all. Electricity, at 110 volts, or even 220 volts pressure cannot force its way through dirty fingers. My neighbors in their surprise at not being able to feel any sensation in touching a "live" wire, sandpapered their finger tips. After some trouble, they got them thin enough to feel a little tickle—not one-hundredth as strong as they feel from an ordinary medical battery.

KNOWLEDGE REQUIRED.—As to skilled attendance required. I am the only one who knows anything about the technical part of it, and I know precious little, merely rudiments that I have picked up from books and catalogs. But I am only at my country place four months in the year, so the responsibility for the rest of the time falls on my partner, who doesn't know a watt from the left hind leg of a rabbit. However, the plant has been in operation two years now, with my neighbor and his wife as the electrical experts in charge, and service has been perfect from the first day, Winter and Summer. What I would like to impress on readers of THE R. N.-Y. is that electric service is the cheapest thing on the farm—cheaper than the farm garden—if he has water power. If he has sufficient power—from two to 50 horse-power, according to his requirements—and a steady wheel, he doesn't have to put in an expensive "governor"; if his water wheel is in his front yard, as is frequently the case, the expense of transmission is reduced to practically nothing: incandescent lights are as cheap as lamp chimneys and last longer, don't have to be cleaned or filled, and can't be kicked over, and won't

start a fire. And, lastly, my neighbor and I consider that we have each added at least $1,000 to the value of our farms by the service. I am so proud of our success that I am anxious to see others try it.

Massachusetts. FREDERICK IRVING ANDERSON.

R. N.-Y.—The danger in electric wires, which has been referred to in our pages, exists where leakage from high-powered systems has charged wires or other metals to a dangerous degree. The thing to bear in mind in every electrical system is that all wires must be fully insulated in accordance with insurance requirements. Also, there is a remote danger involved in contact with metal (for example, standing on a hot-air register) while turning on a light or handling a telephone. If, by any accident, the appliance touched had become highly charged, one might thus complete a dangerous circuit.

WHAT FORM OF LIME?

I LIKE very much what you said about the use of lime in one of your recent issues. This evil generation is "seeking after a sign." It wants a recipe for profitable farming, so that it can do it with eyes shut, just as an indifferent cook follows a recipe book, and the farm institutes and county advisers and "social uplift" philanthropists are endeavoring to furnish them recipes for their work. Nobody is paying much attention to teaching the farmer to think for himself and apply general principles, instead of cook book recipes, to the management of his farm. E.

What we said was that a farmer starting out to use lime ought to think and figure for himself. There are "stone" lime, "quick" lime, "lump" and "caustic" lime—all the same. They represent the limestone taken from the quarry and burned in kilns. When this kind of lime takes up water it "slakes," and is variously known as burned lime, agricultural lime, "lime" or hydrate of lime. When the limestone is crushed or ground without being burned, it is known as ground limestone or carbonate of lime. "Hydrated" lime is the quick or lump lime ground to a powder, and carefully slaked by means of a spray of water, so that every particle is acted upon. The chief difference between slaked and hydrated lime is that the latter is very much more carefully treated with water.

Now the agents who sell hydrated lime will tell you their lime is the only one to buy. In the West we have a group of authorities who say you should use nothing but ground limestone. Some of them are quite bitter about this, and are almost ready to send a man to jail for differing with them on this advice. Our idea is that a farmer should figure it out for himself. On our own farm we use about 10 tons of lime each year, and we buy the form which gives us the cheapest pound of lime. We get figures on hydrated, ground limestone and slaked lime. It is some distance from a lime-kiln and the freight is high. The manufacturers give a guaranteed analysis of their lime—we would not touch it if they did not. Then we take the price of each lime delivered at our station, the guaranteed analysis, and find how much a pound of lime costs. In order to get equal results we must use two pounds of ground limestone to one of slaked lime. Our soil is hard and tough, and we plow under green crops each year, and an active form of lime does best. We find that slaked lime, under these conditions, is cheaper than ground limestone. Therefore we buy the slaked, and pay no attention to the people who say we should buy ground limestone or "hydrated" because others do. The quick or lump lime would be cheaper, but our laborers do not handle it well. The only safety for a farmer is to study and find out what he needs, and then figure for himself. This thing of depending upon others to do our thinking and figuring for us is all wrong. We pay them for doing it. We never can be free until we learn to do it ourselves.

DOUBTS THE BUSY BEE'S BUSINESS.

I FIND a number of things to criticize in the article on bees (page 1233). The experiment on the "50-acre orchard about nine miles north of Medina," proves nothing; or rather only that something increased the yield and improved the quality of the fruit. It is my belief that the increased yield and the improved quality would have come if the bees had been sent 50 miles from the orchard and the pruning and spraying had been done as carefully. In our own orchards we have had nearly perfect pollination many years when we did not see a bee in the orchard during the whole time of blossoming. Last Spring we were in the cherry orchard when it was in full bloom, and the matter was brought up by a man who had just published an article on the subject. In 15 or 20 minutes' search we saw perhaps a dozen bees, and I doubt if there were 500 bees in the block (about 1½ acres), but we sold more than 10½ tons of cherries from the same block the following July. To be sure, there were many flies and other insects about the flowers, probably a dozen or more for each flower all the time. For this reason we cannot feel that the honey bee is of special interest to the apple grower in this section.

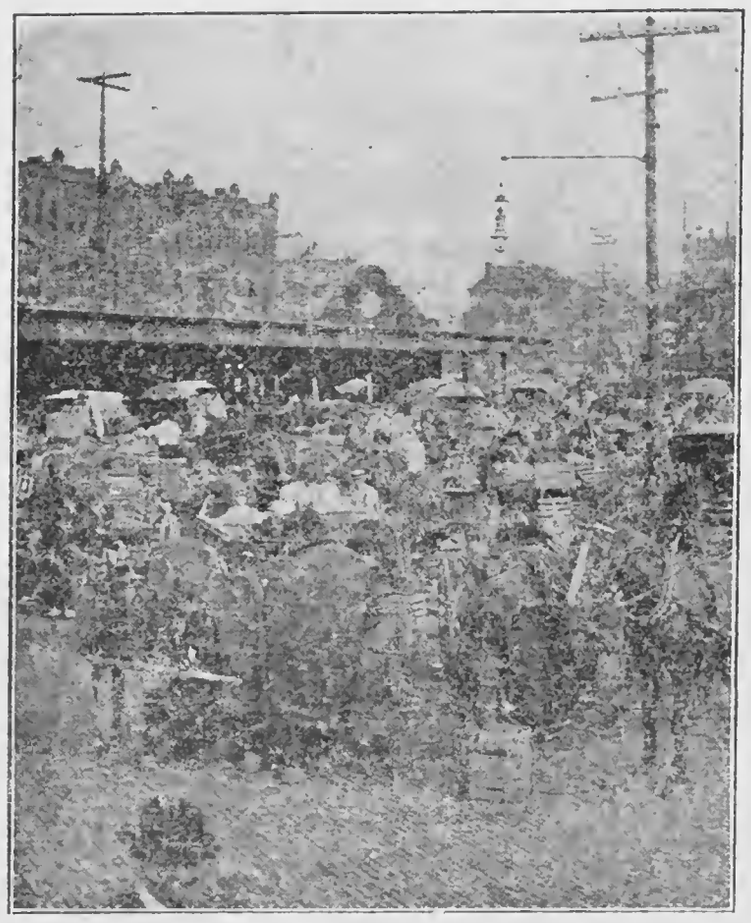
Wayne Co., N. Y. ALFRED C. WEED.

KAINIT AND WHITE GRUBS.

I have seen it stated that kainit, sown on land intended for strawberries, was good to keep away the white grubs. Could you give me any information on that point, and what effect on land planted with potatoes? F. J.

Massachusetts.

This suggestion quite often appears in print, but there is little to it. In order to have effect upon the



IN THE SYRACUSE, N. Y., PUBLIC MARKET. FIG. 588.

insects it will be necessary to use so much of the kainit or salt that it would be unprofitable, or the excess would partly sterilize the soil. Many experiments have demonstrated this. We should not think of planting strawberries on land where white grubs are known to be bad.

SEEDING OVER A POTATO FIELD.

I HAVE just finished digging a three-acre field of potatoes. It is too late to seed it to grass, or to sow a cover crop of any kind, as I wish to seed it to grass or clover of some kind next year. The field is as level as a floor, and the soil is fairly good. I dug the potatoes with a large digger, which has left the ground

A RIOT OF PENNSYLVANIA RYE. FIG. 589.

more mellow than if it had been plowed. I think that I shall let it lie as it is until Spring, then disk it, and harrow it thoroughly, to kill out weed seed, liming it in the meantime; then sow it to what? Is there any grass or clover that I could sow under above condition, that would bring me any crop next year, and remain as a permanent meadow? H. J. I.

We should follow one of two plans. Let the soil alone this Fall. In Spring lime it well and chop it up with the disk. Then sow oats and Canada peas. You may seed Timothy, Red-top and clover with the oats and peas if you like, making a thin seeding of the grain. In this case cut the oats and peas early and cure for hay. The grass will then come on and make a fair, permanent stand; or you can sow the oats and peas alone, thicker than you would if using the grass seed with them. In this case cut the oats and peas for hay and then plow the stubble, fit the soil well, and seed to grass alone in late August or September. By seeding the oats and peas alone and then seeding to grass you will get more hay and a more permanent and stronger meadow, but you will have to do twice as much work at fitting and seeding.

TWO PICTURES.

THE pictures on this page show a scene in the Syracuse, N. Y., public market, and a rye field in Pennsylvania. The Syracuse market is patronized quite freely by farmers, who drive in with their goods and sell, either direct to the consumers or to dealers as they prefer. In many parts of the country this public market has come to be a great help to farmers who are near enough to drive directly in with their goods. Many large towns are still without the public market. Every now and then we see in the papers statements to the effect that certain of these markets have proved failures and should be given up. In every such case that we have investigated, we find these reports have started from the grocers and butchers, and with no particular foundation in fact, and in all cases which we have investigated, the farmers themselves are greatly in favor of the market and would fight hard to retain it.

The other picture shows a sample of rye grown by J. P. Campbell, of Crawford Co., Pa. This is certainly a fine sample of rye. We find many farmers who know nothing about this tough old grain, and who, not having grown it, have formed the idea that it is an inferior crop, not worth bothering with. In our own farming, rye is one of the most valuable crops we have. Near the larger towns and cities there is a fine market for the straw, and the grain also sells readily, or could be ground with corn to make a good feed for work horses. Certainly the rye shown in this picture is big enough. We have great success with rye as a cover crop, and we throw a quantity of seed rye in with every other cover crop seed in the Fall. While it adds little or nothing to the soil except organic matter, it gives a lot of that, and on many of our hard top soils, this is just exactly what we need.

WHY IS THIS SOIL CHEAP?

I AM sending you to-day by express a bag of potatoes. On one acre we dug 500 bushels, 50 per cent. like ones sent you. Can you explain why it is that land like this is offered at from $15 to $20 per acre with fair improvements, and no takers, while through the Middle West and Pacific Coast it is selling for $100 to $125 per acre, and sometimes with no improvements? What is wrong with this section?

Schoharie Co., N. Y. JAS. C. CASKEY.

The potatoes were large and fine. One of them weighed 41 ounces—most of them weighed over a pound. They were remarkably dry and "mealy" for such large tubers. At least a dozen families sampled them, and while the larger tubers had "hollow hearts," they would rank as high-class eating potatoes. In another letter Mr. Caskey adds this:

Potatoes were planted on side hill facing north; sod turned over 30 days before planting. One ton of fertilizer was used; never sprayed; soil was mealy, like the potatoes when boiled with their jackets on. There is considerable stone on land and shale rock. Oats turned out 40 bushels per acre; barley 50; buckwheat 36.

He may well ask why such land sells at $20 or less per acre with few if any buyers! In our own section these potatoes would quickly sell at one dollar per bushel, and such a crop would be worth at least $400 per acre at a cost of perhaps $60. Land which sells for $125 per acre in the Middle West will not average crops which bring $50 per acre. Yet here is $20 land producing 500 bushels of potatoes or 50 bushels of barley. This land is within short hauls of several large manufacturing towns. With modern tools and appliances—think what a first-class farmer could do on such soil. Yet it has little sale. The trouble cannot be in the soil or in the market. Can it be in the spirit or lack of spirit of the people?

WHAT are the dum-dum bullets we read about in war reports? A soft bullet which expands on entering the body, making a hideous wound. First made at the Bengal Arsenal at Calcutta. A dum-dum speech is one that expands in side a man's head—makes him think!

KEEP away from the hen! Keep away from the hen! We print this advice to the know-it-all men who think because some blowhard has been heard to claim that he makes fifty dollars a bird they can rush in without knowing a thing about hens and catch fortune right square on the wing.

WASTE NOTHING AT BUTCHERING TIME.

Farm Pork-Making in Illinois.

PERSONAL EXPERIENCE.—In butchering, various farmers' have various ways, each one no doubt believing his method the best. So it is with myself. Having had many years of experience in the operation, I wish to relate briefly some things which may or may not be of interest to others similarly engaged at this season. For 24 hours previous to killing I withhold all feed from the hogs. When this is done the entrails are less likely to be ruptured than when full, and the work of removing the fat adhering thereto is more conveniently done. When ready to kill I exercise care to avoid all undue excitement. When the animals are quiet at the time of being killed this aids a freer discharge of the blood, any of which if retained in the flesh, prevents successful curing of the meat and causes it to spoil during hot weather. Some men knock their hogs in the head with an axe before sticking, others simply stick them and let them bleed to death, but the method I prefer is to shoot them with a good rifle before sticking, being sure that the first ball fired enters the brain. I think we should be humane in killing hogs and do it as quickly as possible, so as to prevent their suffering. When life is extinct the hog is stuck with a knife of medium length with a keen edge, the knife being inserted just forward of the breast bone and close to it. The blade is then turned and thrust full length toward the tail, being quickly turned from right to left to sever the veins of the neck and avoiding a side or shoulder stick, or other defective work.

PREPARING FOR THE WORK. — Of course before killing everything has been made ready, water heated, gambrels and spreading sticks ready, etc. It is very important to get a good scald, so that the hair can be easily and quickly removed by the scrapers. The water is first brought to the boiling point, then a small quantity of wood ashes is put in, which helps to loosen the hair and remove scurf from the skin. The water is allowed to boil briskly for a few minutes before being used. I am not in favor of guessing at the proper temperature for scalding. I use a thermometer with which the right temperature can be obtained every time For large hogs weighing around 300 pounds 170 degrees F. is about right, for smaller ones the water should not be above 150 or 160 degrees, and then the hogs should not be kept in the water long. Anyone who has had experience knows that it is better to have the water too cold than too hot, for in the former case it may be remedied by adding hotter water, while in the latter case the hair becomes set and the skin cooked tender so that with ordinary scraping the skin comes off.

SCRAPING.—I have a scalding tank with two trace chains across it on which the hog is laid. One end of each chain is fastened on one side of the tank and when the carcass is on the chains two men each holding the free end of a chain, let the hog down into the water, roll the body about three or four times, and then pull it out to air. The process is repeated until the hair "pulls easy." When the hair comes off freely from the legs and ears the scald is sufficient. The carcass is then laid on the platform and the scraping process begun, the legs and head being first cleaned. After the hair is all removed the carcass is hung up by means of a rope and pulley blocks to a firm support previously prepared. The body is washed by drenching it with hot water, and all scurf and stray hairs removed by scraping it down with a keen knife. When this is done the carcass is given a dash of cold water and the scraping continued until the hog is thoroughly clean.

DRESSING.—To remove the entrails with dispatch and cleanliness requires some skill. With a sharp knife I open up the front of the body, taking the greatest care not to cut into the intestines. As the entrails are being removed a large tub is ready to receive them. The fat is removed from the entrails while they are yet warm. The heart, liver, lungs, windpipe and tongue are cut out all together. Having placed a cob or piece of wood in the mouth to keep the jaws apart, and the spread stick halfway down the belly to open the sides plenty of clean cold water is dashed in until the interior is perfectly clean. The carcass is allowed to hang until cold and firm.

CURING.—For dry curing I use the following mixture: For every 100 pounds of meat I take three pounds of coarse salt, two pounds brown sugar, one pound of allspice, two ounces of saltpeter, which is well powdered, and one ounce of carbonate of soda. These are all well mixed together before being applied. I rub the meat first with one pound of honey for every 100 pounds of meat, then rub with about two-thirds of the preparation, until it begins to stick well, which is generally in about seven minutes. The first two days' rubbing is the most important, and unless the meat cures then it is not in a suitable condition. After such rubbing the meat is stacked in a large box, first putting in a thin layer of salt at the bottom. A layer of sides is put on this, with the rind downward, then another layer is crossed on this and so on until all the bacon has been put in. After 24 hours I turn and rub again, adding a little more of the above named mixture, after which turn and rub once in every 48 hours, using a little more of the mixture each time. I place the sides which are on the top to-day on the bottom to-morrow, and so on. After 21 days it is ready for washing, trimming and smoking.

"TEN MINUTES FOR REFRESHMENTS." FIG. 590.

WASHING AND SMOKING.—In washing I place the meat in water just warm enough to bear my hand in, and then brush over with a coarse brush, which removes all fat, sugar, slime, etc. Then place in a tank with clean cool water for 24 hours. This takes out the surplus salt, and renders it mild-cured bacon. Afterwards I hang up in a dry place where there is a good draft. If the days are fine and dry, with a slight breeze of wind, the bacon is generally sufficiently dry in about a week. In trimming the meat the sharp points of the rib bones are sawn off and the remaining part of the fore leg also sawed off level with the shoulder. The knife is then run over the belly part of the rib bones and any loose pieces removed. The sweat skin is scraped off with a sharp knife, and the side is then rubbed over with a little olive oil, which gives it a nice glossy appearance. In smoking the cuts the smoke is conducted to them as cool as possible. The walls of the house are 12 feet high, the meat being hung close to the top, the cuts being about six inches apart. From four to five days' smoking is given, care being taken not to smoke too much, as this greatly affects the flavor of the meat. Hardwood sawdust makes excellent smoke, so do hickory chips also. A small fire is started beneath the meat, a few handfuls of sawdust being placed on it. Then a sheet of iron or something similar is placed on top, which causes the fire to smolder and produce smoke only. After being smoked the meat is placed in calico bags, exercising care to tie them tightly on top, and hung from the ceiling until the weather gets warm. It is then packed away in perfectly dry bran. Some may think I go to unnecessary trouble in the care and handling of the meat, and I will admit that I put a good deal of work on it, but in anything I want the best, and I have never eaten bacon that I liked so well, even that put up by packing houses, as the meat made on my own farm. By treating the meat in the way above described I can if I should wish to do so, keep it for years in good condition. In the care of meat there is a point that should not be lost sight of, and that is maintaining as far as possible an even temperature. Too much heat will cause the fat to melt and turn musty, and if too damp it will sweat and decay.

LARD MAKING.—In refining the lard we use a large iron kettle set over a slow fire. A small amount of water is poured into the kettle, the vessel then being filled to the brim with fat which has been cut in small pieces and washed to free it from blood and other impurities. A lid is placed over the kettle to prevent the entrance of foreign matter, the fat kept simmering for several hours. The cooking must not be hurriedly done. From time to time the fat is stirred and the cooking continued until the contents cease to bubble and become clear. There is still water in the kettle as long as the contents show a cloudy or milky appearance. To refine a kettle of lard thoroughly from six to eight hours' constant cooking is requirel. When the liquid becomes clear the kettle is removed from the fire for the contents to cool. The cracknels are dipped from the kettle, the liquid then being pressed out of them. Small wire sieves are used to prevent any of the fine particles from getting into the lard. The lard is preserved in lard cans which are purchased at the stores for from 15 to 25 cents each. These cans are those used by packing houses, and have, of course, previously held lard. The trimmings of the meat, together with the head, feet, liver and kidneys, are used in making sausage, sour souse and head cheese, all of which is sold to people in town at a good price, except that which is preserved for future use in our home. H. W. U.

English Farmers and War Prices.

HERE is a new idea from the London Gardener's Chronicle regarding farm produce prices:

Complaints having reached the Board of Agriculture and Fisheries that the arrangement under which notices were circulated throughout England and Wales, inviting farmers to make returns of the quantity of produce they have to sell at fair market price for the use of His Majesty's forces, is not working quite satisfactorily, the Board is taking steps, in consultation with the War Office, to constitute in each county or group of counties a Farm Produce County Committee. The committees will consist of leading farmers nominated by the presidents of the Royal Agricultural Society of England, the Central and Associated Chambers of Agriculture, the Farmers' Club and the National Farmers' Union. These committees will invite farmers to submit samples and to quote prices for the various classes of farm produce which they wish to sell for the use of His Majesty's forces, and it is hoped that they will be in a position to take up their duties in some districts in about 10 days' time.

England is now a great war camp, where 1,000,000 men are being drilled and trained for service in Europe. In feeding and equipping these men the English government is evidently trying to get past the middlemen and deal direct with farmers or their organizations. This gives a fine chance for the coöperative societies to act for farmers.

FARMERS' CLUB

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see whether it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

Well for Cesspool.

I AM moving into a new place; it has city water and some of the conveniences, but not all. Just back of the house is a well 31 feet deep that is not used now the city water is in. The water level in this well does not vary over four or five feet between the driest and the wettest season of the year. The soil in this location is not at all sandy or of a gravel formation; in fact, we are right on the edge of the blue clay belt, and there is no drainage so an ordinary cesspool will work. Would it be possible to put in toilet and bath and use this old well for a cesspool? One contractor who was at the place told me it would be just the thing, but I could not help thinking perhaps he was after a job more than my welfare. It was so contrary to what I had supposed was necessary in a cesspool. This man told me the water level in the well being so constant showed that the liquid matter would drain off and that the top could be cemented on and buried two feet under ground and not need attention in years or a lifetime. Can you tell me anything about it? Also can you tell me if there is any advantage in putting a load of clinkers in the bottom to break up the paper, etc.? R. L. P.

Fords, N. Y.

Any attempt to use this well as a cesspool would probably be ill-advised as an open soil is essential to the success of that method of sewage disposal. By acting as a crude septic tank, the well might serve the purpose for a time, but its efficiency would probably be short-lived. A properly constructed septic tank need not be expensive and would provide a permanent means of disposing of your house sewage. I cannot imagine any purpose which a layer of clinkers would serve in the bottom of a tight well. M. B. D.

Roots in a Well.

DO you think the roots of live forest trees in the bottom of a well would pollute the water, or would they tend to absorb any impurities? C. W. D.

Noank, Conn.

I know of no reason for thinking that tree roots in a well could have any appreciable effect upon the purity of the water. It is true that plant roots absorb from the water with which they come in contact certain elements of plant food, and that they also excrete other substances, probably deleterious to plant life, but that this interchange could materially affect the volume of water in a well seems to me highly improbable, though I know of no studies that have been made to determine this. The water from which plants derive their food is probably that thin film which surrounds all soil particles rather than the soil water which exists in bulk and fills the wells. M. B. D.

Adventures With Plant Lice.

THE past Summer there grew up in a bed on the lawn, a plant of scarlet sage. It was about 3½ feet high and 1½ feet in diameter, and stood alone in a clear place with nothing touching it. At one time about mid-summer, it was simply covered with plant lice and numerous ants. My son tied, tightly, about the stem near the ground, a strip of sticky fly paper, so that no ants could pass up or down. Three or four days later, when my attention was first called to the plant and his experiment, the plant was entirely free from both ants and plant lice. Perhaps two dozen dead lice were sticking to the fly paper, but no ants. What became of them? And was the fly paper the cause of their disappearance? A few young chickens had access to the lawn and they like ants, and ate all that they can reach. Certain small birds, of the warbler family, eat plant lice about here, but I have never known them to demolish them noticeably or to clear a plant of them. E. B. H.

That Congregation of English Sparrows.

IN answer to your query on page 1280 as to how to get rid of the English sparrow, for over 10 years I have tried many devices for exterminating these pests, and I have found the trap designed by Dr. A. K. Fisher, of the Biological Survey, in Washington, D. C., the most efficient. I made one of these traps at a cost of about 90 cents, and hundreds of sparrows have been caught in it. The method of making this trap is shown in Farmer's Bulletin No. 383, issued by the U. S. Department of Agriculture.

Geneva, N. Y. W. W. G.

Conditions here are similar, though perhaps on a smaller scale. When the season's output get together there are multitudinous twitterings in the street trees at nightfall, and in the morning the pavement is littered with their droppings. In Hartford, Conn., large flocks of blackbirds and starlings became a noisy nuisance by making the city trees their roosting place. The city authorities got up a Fourth of July celebration for their benefit (?) in which Roman candles figured largely. The astonished recipients of colored fireballs fled in noisy confusion; after being saluted thus for two or three nights they "vamoosed the ranch" for good. This brilliant strategy or the use of a high-power hose might prove a nightmare to the sparrows. But, like town liquor option, it but moves the pest on to trouble other localities. For several years the writer has fought the pernicious sparrow with poison, nest box-traps, shotgun and air rifle, but with no observable diminution in their numbers. But this Summer I have solved the problem, reduced the unwelcome visitors to a negligible quantity, and cut deep into the town supply. The cage type of trap is the way out. This style of trap is reported to be doing fine work in cleaning up public parks and private grounds. Some patrons have caught 800 and 1,000 sparrows. If one chooses to make their own, Farmer's Bulletin 493 gives drawings and directions for each trap. About the middle of June I built a cage trap of 5-16-inch mesh, 30x15x12 inches, and experimented with swinging doors, modified funnel entrances, etc.; later equipped the trap with tipping chambers, then I literally got the drop on them; 360 were caught in my garden up to October 1, 200 in 3½ weeks, 51 in two days, more than were destroyed by all other means in two years; and I am still getting them whenever a new crowd comes in. But for this effective reduction of the breeding stock next season would have seen us swamped with them. As the birds are caught unharmed any chipping sparrow that gets into the toils is released without other damage than a period of enforced idleness, and a slight ruffling of his feelings and feathers. If A. C. K. will bait his unwelcome lodgers with cracked corn and white bread, and put a cage trap into commission he will get these pests by the hundred, and get rid of the nuisance so that it will never come back, for a dead sparrow is a good sparrow. CHAS. A. BANISTER.

Massachusetts.

Abbreviated Tales.

COVER CROPS.—Early in November the Rhode Island college at Kingston, made the following report on cover crops sown in the cornfield in August:

"From all appearances now Winter vetch is the most valuable crop for that purpose. Despite the abnormally dry Fall we have experienced, this crop, growing in the shade of the corn until a few weeks ago, has now made 16-18 inches of growth in many places. The other legumes planted in like manner, it seems have hardly made more than one-fourth of the growth that the vetch has made. Sweet clover and Alfalfa have made several inches growth. Crimson clover ranks next, and Red clover is hardly noticeable."

This is very satisfactory—far better than we could do this year in New Jersey. The dry weather has held our cover crops back. They will start, however, and partly make up for it next year. Think what this vetch means on that light Rhode Island soil. When it is plowed under next Spring it will be like putting five to eight tons of good manure on each acre.

AN EFFECTIVE "KILLER."—A Pennsylvania reader sends us the following from a local paper:

"Three Holstein cows and four heifers, valued at nearly $2,000, the property of A. O. Shirey, of Williamsport, who owns a stock farm near Linden, are dead, the result of arsenical poisoning, and five others may die. A wash containing arsenic and other ingredients, the formula for which was obtained from a farm magazine, was applied to the sides of the animals to kill insects. The animals licked some of the poison from their hides, and it is believed that more was absorbed through the pores. The mixture was applied at night, and in the morning the seven animals were dead."

We ought to know more about this before forming conclusions. Probably it was a wash for killing lice, in which case tobacco, kerosene emulsion or sulphur and lard would have done the work. This idea of using a poison where animals can lick it up is much like suicide. Sometimes, too, the people who mix such stuff do not follow directions. We have known of cases where people read such directions hastily and used twice as much of some dangerous drug as they should have done. That is why we hesitate to recommend the use of drugs without the advice of a competent authority.

HAY CAPS.—In regard to cow peas and hay caps, will say that we shocked some and covered them with ordinary burlap, such as bran sacks are made of, and weighted them at each corner with one to two pounds weight, and made hooks out of ordinary baling wire. It was a perfect success. We have used burlap for years to cover wheat stacks, and straw remains bright to the very top.

Missouri. W. RIEHL.

NEW YORK STATE NEWS.

FOREST PRODUCTS CONVENTION.—The annual convention of the Empire State Forest Products Association is in session this week (Nov. 12) in New York City. A long list of speakers contributed of their expert knowledge of forestry work that is being conducted in this State and on the legislation that is deemed necessary to protect our forests and conserve their products. Frank L. Moore of Watertown is president of the Forestry Products Association.

STATE FAIR MATTERS.—There is likely to be a change in the administration of State fair affairs after January 1, now that there has been a change in the State administration. It is rumored that a change in the make-up of the State Fair Commission will be made if the Legislature can be induced to look upon the plan favorably, and an entirely new policy of management established. The plan will be to amend the present law to reduce the size of the State Fair Commission and instead of a commission of seven, five appointive and two ex-officio members, there will be a commission of three to consist of a State Fair Commissioner, the Lieut. Governor and the Commissioner of Agriculture.

COMMISSIONER ON TUBERCULOSIS.—The commission appointed by Gov. Glynn some time ago to investigate the extent of tuberculosis in cattle in this State, met for organization last week in Albany when Prof. Theobold Smith of the Rockefeller Institute of New York was chosen president and Dr. Linsly R. Williams, deputy commissioner of health, secretary. Gov. Glynn addressed the meeting and urged that the commission proceed to do some thorough work to stamp out tuberculosis in New York State cattle. The commission is constituted as follows: Dr. Theobold Smith, Rockefeller institute, New York; Dr. Hermann M. Biggs, commissioner of health; Dr. Linsly R. Williams, deputy commissioner of health; Dr. Henry L. K. Shaw, Albany; Seth Low, Bedford Hills; Professor Veranus A. Moore, Ithaca; Albert L. Brockway, Syracuse; Albert Manning, Otisville; V. Everit Macy, Ossining; H. J. Wright, New York; James A. D. S. Findlay, Salisbury Mills; Edward Van Alstyne, Kinderhook; Henry Best, West Sand Lake.

FARM BUREAU MATTERS.—The second annual conference of the Farm Bureau managers of the State will be held in Ithaca Nov. 19-21, and for the three days preceding it there will be a meeting of the Farmers' Institute Normal at Geneva, both of which meetings the Farm Bureau men are expected to attend. On Dec. 7-10 the annual meeting of the State Leaders of Farm Bureau work in 33 Northern States will take place in Chicago. The work in the State is progressing favorably. In two counties, Chemung and Broome, the entire responsibility and management of the Farm Bureaus has been transferred from the Chambers of Commerce to the Farm Improvement Associations which are composed entirely of farmers. In Nassau County, where there are no Granges through which to work the manager has found the teachers of the rural schools ready to coöperate and the schoolhouses have been used for meeting places. F. C. Smith of the Allegany Bureau has conceived of an excellent plan of organizing the work in the county. He secures committeemen from different sections of the town, men who are successful farmers, to coöperate with him in various ways. A potato show will be held this month. Mr. V. B. Blatchley succeeds H. E. Babcock as manager of the Tompkins County Bureau, Mr. Blatchley having been appointed an assistant professor of extension on the college staff and will give his entire time to the State work as assistant to the State director. On October 27 State leader Crocheron of California brought to the State College of Agriculture, on a visit, 20 boys who were winners in club contests in some local high school communities in that State.

ANTI-TUBERCULOSIS MEETING. — A meeting in the interest of the anti-tuberculosis movement in the State was held this week, Nov. 11, in Syracuse in response to a call of the State Charities Aid Association and the State Board of Health. It was a meeting of the general staff, so to speak, to shape future campaigns. The State Grange public health committee is coöperating in the movement.

MUCK LAND CROPS.—The muck land crops of Madison County are the largest in recent years. The onion crop will measure about 480,000 bushels, it is said. Fully half the crop has been shipped from Canastota and vicinity. Prices range from 30 to 35 cents a bushel. Celery has been a good crop and the acreage is somewhat larger than last year. Cabbage is a large crop and is bringing from $5 to $7 a ton. J. W. D.

"GEORGE," said the Titian-haired school marm, "is there any connecting link between the animal kingdom and the vegetable kingdom?" "Yeth, ma'am," answered George promptly, "Hash."—Outdoor Life.

Order Sunlight Double Glass Sash—NOW

The J. Weller Co., Cincinnati, O., the famous canners, ordered first in 1911. In 1912 they wrote: "We will buy more this winter." They did. Also more in 1913 and 1914.

No More Mats and Shutters

Extra thick, of cypress, everlasting, double-glaz with an air space that admits the sun, but not the col this sash has rendered the old style single layer sa obsolete. It eliminates mats and shutters cutting the c one-half and doubling the efficiency in the garden.

Get Our Catalogue

Our free catalogue explains everything in detail both about the sash and the Sunlight Greenhouse on which the sash are also used. It is inexpensive, attractive and a highly profitable addition to any garden.

If you wish it, enclose four cents in stamps for a copy of Prof Massey's booklet on the use of cold frames, hot-beds and small greenhouses.

Training an Airedale Dog.

I LIVE on a main street where lots of autos and cars pass. My Airedale, 10 months old, well trained except he will run at time to play with any child he sees, and at times will follow some particular team he takes a fancy to. I have 29 acres, but only 250 feet frontage. I have never taken him on the street, he will rush out to play and I cannot stop him. I have whipped him, but he cannot be trusted. I have had him on a chain for four weeks. Would you give me some advice in regard to him? What would you do to train him to stay in the yard? H. F. R.
Massachusetts.

If H. F. R. has an Airedale, the Airedale can be taught to mind—the material is in the dog to work with, and the rest is with the master. By nature and by the art of breeding, the Airedale has been endowed with the gifts fitting him to do whatever a dog may be called upon to do, but proper training enables him to do it more easily and better. The Airedale has exceptional brains, consequently easily taught, obedience becomes a habit with him. In training him be sure he knows what you want him to do, and see that he does it. When you call "Come" see that he comes, or to "lie down" see that he does lie down. When the dog misbehaves, such as rushing out on a pike, to follow a team, bark at an auto, especially if you live on a main road, like in my case, the main thoroughfare between New York and Philadelphia where traffic is great, it not only endangers the life of your dog, but tries your patience also. I have no trouble in that respect, my dogs are not permitted to follow my own team or car, their place is home, and home they stay. Teach your dog from puppy up to mind, punish him in the "act" otherwise he will not know for what offense he is being punished.

Don't beat your dog, nor hit him over the head; that causes deafness, broken bones, etc. Smack him on the haunches, or a smart slap under the jaw, and above all a cross tone of voice, as the voice works wonders. The tone of voice make my dogs obey. Don't beat a dog into submission, nor break his spirit, but impress upon him that he is to do just as you say. It is not wise to chain an Airedale, he is too full of life, and as lively as a cricket. If you have any difficulty in training a dog, that has not been made to mind at the start, rather than chain him, make a pen for him out of chicken wire, about 30 feet run. That will give him exercise, as an Airedale is against his nature chained. When you go walking take him with you, he will then soon learn to mind. When you have owned one or more Airedales, you will learn to appreciate their worth. They are the best of watch dogs, are cross, but not savage or vicious. As for fighting, he is slow to take offense, but when once his "dander is up" he is game to the core, and will stay by till the finish. When the Airedale develops to maturity at about a year and a half, he loses his puppy ways, and becomes the practically useful all-around dog. His character is sterling; he is honest, trustworthy, a disposition of the very best.

W. A. L.

Sewage Disposal.

I WISH to build a sewage disposal plant for a small family of three, with one bathroom and general kitchen water. My soil is a sandy loam three or four feet deep; then it is coarse sand for 30 or 40 feet deep. Will you advise what is the best thing to build? What do you say about the system of two compartments made of concrete, square, with tile to carry off the water? What is the best and cheapest system to use, what size and how to build it?
Catskill, N. Y. G. H. P.

The simplest method for disposal of house sewage in such soil as you describe is the ordinary cesspool, or pit, made by excavating a hole six or eight feet across and as deep, or a little deeper; this to be stoned up without mortar to within about two feet of the surface and covered with soil. If such a cesspool can be dug 100 feet or more from any well and on the down-hill side of neighboring wells, it is reasonably safe and many such cesspools are in use. Where it is not practicable to carry house sewage to a safe distance from wells concrete septic tanks with tile disposal systems are becoming very popular and have the advantage of greater safety. They are much more expensive to build, however, and have not entirely superseded ordinary cesspools. They have been frequently described in these columns and are very fully discussed and illustrated in a bulletin entitled "Sewage Disposal for Country Homes," issued by the State College of Agriculture at Ithaca, N. Y. A request will bring this bulletin to any citizen of the State. M. B. D.

Turning Under Corn Fodder.

I HAVE about 1,000 bunches of corn fodder. I keep no cows, only one horse, have hay and straw. While I have not enough manure I had thought of cutting or shredding about 600 to 700 bundles, and hauling it on the sod this Fall to be plowed down in November. I do not pasture the sod, and there is a good aftermath on it. This would help me out considerably. The manure I make, I want to use on the truck. I do not wish to buy any more fertilizers, than I can help, unless it is phosphoric acid and potash, as I have only three years to stay. Corn fodder is plenty and there is not much sale for it. E. R. S.
Pennsylvania.

This plan will work. You will get more available plant food by cutting the stalks and using freely for bedding or mixing with the manure. If you can rot the cut stalks down in a moist pile they will be more like manure, and wet horse manure mixed with them will hasten their decay.

NOTES AND COMMENTS.

THAT $140 AN ACRE FROM CORN.—It must be remembered that the prices for corn, corn stover and hay are much higher in the South than in the North. The long season gives the Southern farmer a great advantage. I have known a crop of over two tons of cow pea hay made an acre after a heavy crop of Winter oats had been taken from the land the same season, and the land then left in Crimson clover for the Winter. [R. N.-Y.—The question on page 1234 was from a New York man about New York land.]

GAME LAWS.—Connecticut farmers seem to be bothered with the deer. Down here we have a foolish law making a close season for rabbits. They are allowed to plunder our gardens all Summer in order that idle men may shoot them in the Fall. There should be no close season for the pests, for no amount of shooting will ever exterminate the prolific rabbit or hare. Many of these game laws benefit no one but the idle loafers that trespass on other men's lands and are just as apt to shoot his cattle or poultry as anything else. Rabbits like deer, are a nuisance to gardeners, and should not be protected. The turkey buzzards which carry the germs of hog cholera over the country are also protected at all seasons, and I have had them flock down and drive the chickens from their food, and have had to drive them off with sticks. In fact I have taken them by the legs and thrown them over the fence, not specially caring whether I damaged them or not.

SHEEP MANURE.—Dr. Jenkins, as you say, puts the matter in a nutshell. I have used the sheep manure as an ingredient in potting soil, and tried it with very poor results in the lettuce frames. For general outdoor purposes there is nothing better than stable manure. I get stable manure delivered on my garden for 75 cents a good one-horse cart load, I suppose nearly half a ton. But our truckers pay $3 a ton on the switch by carloads from New York, and the manure I get is better and has less straw in it, but the supply is too limited for the larger growers, and I get the product of one particular stable where a pair of horses are kept for city hauling. Just now I am covering my garden over thickly with this manure. It will lie on the surface all Winter, covering the vacant spots and mulching the Winter crops of onions and spinach, and will be rotted by Spring without getting heated as it would in a pile. Then, knowing that potash is going to be hard to get and our sandy soil needs it, I took time by the forelock and laid in a supply from the stock the manufacturer had on hand ready made, and had to let the five per cent. of potash it contains go, though he will not sell any potash alone now at all. This fertilizer will be used in the Spring to balance the plant food in the stable manure. The ground where the spinach is growing was stuffed with manure before sowing, but more will do no harm, for the more nitrogenous matter at hand in the soil the finer the leaves of the spinach.

My last sowing of spinach was made the ninth of October. This I hope to get strong enough to winter over for Spring cutting, while the earlier sown is now being cut, and will be for use all through the Winter. The one crop that does not seem to have minded the dry weather is the chard. Now since spinach has come into use, it is no longer needed, and the growth is simply enormous, leaf stalks and leaves fully four feet long. It is now the 16th of October, and we are having a long deferred three-day easterly rain, and not a sign of frost yet. The manure is going on at rate of 50 big cartloads an acre, and the garden will have a splendid Winter blanket. W. F. MASSEY.

Be free from heating slavery!

Few things in modern home-life are more *monstrous* in their imposition on the patience, energy and well-being of women than old-fashioned heating devices. They enslave the home-makers with care-taking, litter up the rooms with dirt, damage the furnishings, waste fuel, half-heat the home. If this is current winter history in your house why not investigate the radiator-way of cleanly, healthful, economical heating—by the use of

AMERICAN & IDEAL RADIATORS & BOILERS

These well-known outfits free the women of drudgery, for they confine the fire, fuel and ashes entirely to the cellar; not even necessary to frequently run to the boiler to fix the dampers. Our SYLPHON Regulator automatically keeps the fire running to suit in mild, average or most severe winter weather, so that you have a uniform, healthful temperature in all rooms. You have no over-heating or under-heating; no waste of fuel. Vegetables in cellar not affected, as Boiler and cellar piping are covered with asbestos—practically all the heat is thus sent to the rooms. Wood, oil, gas, lignite, hard or soft coal (even the cheap grades of pea-coal, slack, run-of-mine, screenings, etc.), can be burned in IDEAL Boilers, which turn the rich gases (abundant in low price fuels) into heat delivered to your rooms, rather than wasted up the chimney.

In our special laboratories, IDEAL Boilers and AMERICAN Radiators are thoroughly tested for their heating capacities, fuel economies and for constructions which will stand all demands made on them without wearing out or requiring over-hauling with repair bills. No form of heating appliances will last so long and give the liberal satisfaction, both in cost of up-keep and thorough comfort, as our IDEAL-AMERICAN outfits, made specially in forms and prices suitable for farm cottages, larger residences, churches, schools, and other buildings. They protect the farm house against fire-risk. Need not be connected to water pipes, as same water is used over and over again, for years.

A No. 4-22-W IDEAL Boiler and 400 ft. of 38 in. AMERICAN Radiators, costing the owner $200 were used to heat this cottage. At this price the goods can be bought of any reputable, competent Fitter. This did not include cost of labor, pipe, valves, freight, etc., which are extra and vary according to climatic and other conditions.

If you would be free from heating-slavery and high fuel bills write us today; "Ideal Heating" booklet and special information—free. Puts you under no obligations.

EVENTS OF THE WEEK.

DOMESTIC.—Fire at the Kansas City, Mo., stock yards, Nov. 7, caused a loss amounting to $125,000.

The thirty-fourth annual convention of the American Federation of Labor opened at Philadelphia, Pa., Nov. 9. The convention will last two weeks. It is expected to bring out sweeping suggestions concerning the work of women and children in the United States and has a large number of women present as delegates of women and children in the various industries.

It was stated, Nov. 9, that a reserve army that will consist of more than 150,000 in five years is being trained by the War Department in coöperation with educational institutions and organizations advocating the upbuilding of a national defence machine. Foremost among the agencies for the establishment of the reserve are the students of military instruction camps, although the National Rifle Association of America, the Army League and other organizations are strong factors in the movement. Students between the ages of eighteen and thirty in universities, colleges and the graduating classes of high schools were trained at the camps during the last Summer, only those physically qualified for military service being enrolled. Army officers are detailed to these camps, and where possible regulars are present to give a touch of realism to the encampment.

The State Department received notice, Nov. 7, that the American liner Kroonland, which had been detained by the British authorities at Gibraltar, had been released and was on her was to Naples. The copper and rubber on the Kroonland, however, were taken off by the British authorities and a prize court is to determine whether the goods are to be confiscated. While the United States Government will probably have a representative at the prize court proceedings as an observer, the burden of defending the copper and rubber taken from the Kroonland lies upon the ship owners and the owners of the goods. Should the prize court declare the goods prizes of war and order them confiscated as contraband destined for the enemy, it is expected the owners will appeal to the State Department, which will then take up the case diplomatically. This case seems likely to be the first test of the British policy of making the ultimate destination of contraband of war the determining factor as to whether it shall be seized or not. The British contend this copper and rubber, consigned to Naples, were really destined for points in Germany.

Richard J. Hartman, who figured in the opera ticket speculation scandal, in New York, last year as president of Tyson & Co., was arrested here, Nov. 10, on the eve of his departure for Europe and lodged in the Tombs prison, charged with the larceny of nearly $700,000 from Mrs. Charlotte L. Mackenzie, widow of James S. Mackenzie, at one time an official in the Singer Sewing Machine Company. According to the information on which Hartman's indictment was secured, his thefts cover a period of three years, during which time he operated with the woman's stocks on the strength of the power of attorney she unwittingly granted him. His speculations have deprived her of her entire fortune, it is alleged.

Reports from Butler Co., Ky., state that the district is terrorized by "night riders," who have been guilty of many outrages.

Henry Siegel, the department store man of New York, under many indictments for larceny in connection with his banking business, was put on trial at Geneseo, N. Y., Nov. 10, feeling against him in New York City being used to obtain change of venue. Ten of the jurors are farmers.

James Powers, head of the Tax Adjustment Bureau of 69 Wall Street, was sentenced by Judge Rufus E. Foster in the United States District Court, at New York, Nov. 11, to serve two years in the Federal penitentiary at Atlanta for using the mails to swindle persons who already had been defrauded in a real estate deal. Powers, it is said, discovered some time ago that a realty company had sold a number of lots under water at Montauk Point, L. I., and that the owners of these lots had not paid their taxes. On the stationery of the Tax Adjustment Bureau he sent these land and water owners a notice that their property would be sold for unpaid taxes unless they sent him $5.86. Thinking that the tax bureau was an official office many of these people, it is said, sent him the money. In all he is said to have taken in between $15,000 and $20,000.

FARM AND GARDEN.—The twentieth annual report of the Granite State Dairymen's Association contains among other interesting matter an article on "More and Better Cows for New Hampshire," by P. A. Campbell, manager of the Balsams Stock Farm, Dixville Notch; also articles on "The Milk Question from the Consumers' Standpoint," by Dr. J. R. Williams, of Rochester, N. Y. and "Summer Forage for the Dairy Cow," by Prof. F. W. Taylor, of New Hampshire College, "Winter Roughage for Dairy Cows," by Dr. J. L. Hills of the Vermont University. The secretary of the association is Fred Rasmussen, Durham, N. H.

The Connecticut Horse Breeders' Association is trying, with the aid of the Boston Chamber of Commerce to induce New England people attending the International Live Stock Show, Chicago, Nov. 28-Dec. 5, to travel together in a special car. Those interested may learn particulars from the president of the above association, Stanton D. Wicks, Pomfret, Conn., or the secretary, H. L. Garrigues, Storrs, Conn.

The cattle quarantine has been extended to New Jersey, Montana, Rhode Island, Kentucky and Delaware, also Canada, though the disease has not yet appeared there. In addition to bovine cattle, dogs, horses, hens, ducks and pigeons are reported infected in one New Jersey case. The Philadelphia stockyards were found to be infected, Nov. 10. Nov. 14 Commissioner Huson raised the quarantine in New York, except on Kings, Queens, Seneca, Wayne and Erie Counties, where the disease still exists.

It was entered on the records at the Nov. 9 session of the hearing in the New York Attorney-General's suit for the annulment of the charters of certain corporations who may be guilty of entering into a monopoly for the manipulation of butter and egg prices that the difference in the price that a farmer got for his eggs in 1913 and the price paid by the consumer was anywhere from 18 to 33 cents a dozen. This statement was reputed to have been made by Henry Dunkak of the firm of Zimmer & Dunkak, 173 Duane Street, and a former president of the Mercantile Exchange, in an interview with an investigator and was reread to Mr. Dunkak when he was on the stand by Deputy Attorney-General Kennedy. The farmer received 17 cents a dozen for his eggs and they cost 23½ cents when they were laid down in New York city. The jobber paid 25 cents for them (it was in December) and the retail dealer handed up 28½ cents when they reached him. Then he sold them to the consumer for from 35 to 50 cents a dozen. Mr. Dunkak testified that the cost to the consumer depended largely upon whether the eggs we e bought in a fancy store or a less pretentious place. Queried as to whether a retailer could mix cold storage with fresh eggs, Mr. Dunkak said he didn't believe he could do it as a regular thing. Howard J. Runyon of J. D. Stout & Co., receivers and jobbers of butter, cheese and eggs, 19 Jay Street, said the profit in his business is about four per cent. gross and two per cent. net. He said conditions have changed in the butter business in the last 10 or 15 years, and cited the installation of separators on the farms as one of the changes.

The Wisconsin College of Agriculture, coöperating with the Potato Growers' Association will hold an annual convention and exhibition at Grand Rapids, Wis., Nov. 18-21.

THE EUROPEAN WAR.—Nov. 7 the forts at Tsing-tao, China, surrendered to the Japanese besiegers, who captured 2,300 prisoners. The Japanese Ambassador at Washington announced that a Japanese-British garrison would occupy the fortress until the end of the war, when the question of returning the territory to China would be considered. .....The British Admiralty confirmed the loss of the cruiser Good Hope in battle off the coast of Chili, Nov. 1, stating that the Monmouth was beached, place not given; the Glasgow and Otranto escaped to the Falkland Islands (British territory).....The German cruiser Yorck was blown up by a mine in a German harbor with the loss of 266 men. .....Nov. 9 the German commerce destroyer Emden was driven ashore and burned in a fight with the Australian cruiser Sydney. The Emden was beached on an island in the Cocos group, southwest of Java. During the past three months the Emden has destroyed British vessels amounting with their cargo to a value of $10,000,000. The Konigsberg, another German cruiser causing great damage to British shipping, was trapped by the British cruiser Chatham when hiding in a shallow river on the coast of German East Africa, where she was bombarded, and then bottled up by sinking colliers acro the river..... Nov. 11 the British torpedo gunboat Niger was sunk by a hostile submarine in the Channel, off Deal, without any loss of life.....Russian forces were reported 10 miles within the East Prussian border, Nov. 10, and they were also in the Province of Posen.....Italy is sending troops to Tripoli, where Italian colonies are threatened by the Bedouins. It is asserted that Turkish and German emissaries are causing trouble..... The Allies are gaining in Belgium, where violent fighting continued Nov. 7, 9, 10. German forces were again bombarded by the Allies' cruisers on the seacoast at Dixmude. The Germans' bombardment of Ypres was reported to cause great destruction. In Alsace the German attack on Ste. Marie Pass is reported to be repulsed.....Nov. 11 the Germans captured Dixmude, but were unable to cross the Yser.....British and French warships have destroyed Dardanelles forts. The Turkish commander at Beirut threatens reprisals on Christians for any Mussulman losses.....A Turkish force is said to have invaded Egypt. The Ottoman fleet has bombarded Poti with heavy damage.

LIMA bean thrashing is being done as fast as the beans are dry enough. The Summer weather being rather cooler than usual, delayed the ripening of the beans on the rich, moist soil, which delays the finishing of the harvest. The culture of the Lima bean began here about 48 years ago. The few seeds, found an ideal soil and climate so they were a great success from the first. The growth of the Lima bean on a commercial basis in this State began here first in Carpinteria Valley, about three-quarters mile from the Pacific Ocean. Their growth has spread from valley to hill soil, along the coast for 200 or more miles. They seem to thrive the best in the moist climate of the ocean. As yet but few insects or other pests have developed to do much harm. So the growth of the Lima bean will be continued. Some of the best soils yield a ton or more per acre, while some of hill and thinner soils yield only one-quarter to half as much. Rich, deep, moist soils are the ideal for the growth of Limas. A large percentage of the Limas grown here go into the seed warehouses, where they are made ready and shipped to Eastern seedsmen. For about 20 years but one variety was grown for the market, the old pole variety we started with. No poles are used here, they run over the ground just as they like to. Since their growth for seed began new varieties have been introduced and developed. Now many of the bush type or short vine kinds are grown. Much careful work in thrashing and handling is required to prevent breaking and splitting, as all such must be cleaned out of the seed beans and sold at a cheap rate.

Carpinteria, Cal. O. N. C.

THE Department of Agriculture tells of a method of burning out the stumps of long-leaf pine, which is used in the Southwest. A trench about eight inches deep is dug around the stump. Then a hole 1½ inch in diameter is bored down from the bottom of the trench into the stump. A small stick of dynamite is exploded in this hole so that the stump is cracked. Then when fire is built in this hole a draft is created which keeps the fire going until the stump is burned out.

COMING FARMERS' MEETINGS.

Maryland Week Exhibition, State Horticultural Society, Maryland Crop Improvement, Dairymen's and Beekeepers' Association, Baltimore, November 16-21.

Institute and convention, Lycoming, County Farm Bureau, Williamsport, Pa., November 17-20.

Annual Show of the Paterson, N. J., Poultry, Pigeon and Pet Stock Association, November 18-21.

Indiana Apple Show, Tomlinson Hall, Indianapolis, Ind., November 18-24.

Dover Poultry, Pigeon and Pet Stock Association, tenth annual show, Dover, N. J., Nov. 23-28.

Mansfield Poultry Association, Mansfield, Mass., third annual exhibition, Nov. 25-28; L. Faye Howe, secretary.

Western Connecticut Poultry Association of Danbury, Conn., Inc., nineteenth annual exhibition Hull's Armory Hall, Danbury, Nov. 26, 27, 28; secretary. Thomas Deans, 39 Hoyt St., Danbury, Conn.

Auburn Poultry Show, State Armory, Auburn, N. Y., Nov. 30-Dec. 5.

Second annual seed exposition, Montana Seed Growers' Association, Bozeman, Mont., December 8-10.

New Jersey State Horticultural Society, annual meeting, State Experiment Station, New Brunswick, Dec. 8-10.

Farmers' Week, Pennsylvania State College, December 28, 1914 to January 8, 1915, State College, P. O., Penn.

January 9th to 15th, inclusive, 1915, Mid-Winter Exposition, State Fair Grounds, Columbus, Ohio, Corn, Apple, Dairy and Poultry Shows combined.

Ohio-Michigan Land and Live Stock Exposition, Toledo, O., Nov. 22-Dec. 5.

"PLEASE lidy, will you help a poor man who ain't done nothin' in the way o' work for more'n twelve munce?" "Dear, dear; perhaps I could find you something. What can you do?" "Thank y', lidy, thank y' kindly, mum; ef y' could p'raps give me some washin' ter do, I could take it 'ome to my wife."—London Opinion.

MEN WANTED—Honest and ambitious in every community to show farmers how to increase their profits with a

New Method Hand Fertilizer Dropper

Drops fertilizer in a CIRCLE around the potato or plant where it can't burn but is reached by all the feeders insuring vigorous growth. Guaranteed to

Increase the Yield 10 to 20%
Saves ½ in Labor

Saves fertilizer. No waste. Quicker and better than team and drill. Perfectly adjustable for potatoes, corn, cabbage, strawberries, tobacco, etc. Capacity 25 lbs. of phosphate. Can't get out of order. Galvanized iron, enameled. Pays for itself first half acre. Your opportunity to save or make big money. Write today for proof of our claims.

Keeping Strained Honey.

I HAVE about 60 pounds of extracted honey which I got in a large tin can. Will it be all right and will this honey keep if put in glass jars with tight lids? If not how should it be kept until the family can use it? L. K. B.

Honey will keep in any kind of a container, whether tin or glass. It will not mold, nor will it sour unless it is kept in open vessels exposed to a cold wet atmosphere, under which conditions it will absorb enough moisture from the air to become thin and watery and become sour in time. Glass jars are all right and considerable honey is sold in them, the only objection to their use being that it is usually difficult to keep the honey from oozing out from under the lid.

E. R. R.

"Teachers" For Farm Women.

WHERE are all the farm women, to sit quietly by and hear so much said and read, so much that has been written about farm women? Only the other day I read in some paper what some woman thought was most needed by us, and would you believe it, she thought we should have teachers sent out by the Government to teach us how to cook! I think she spoke of bread as one of the things we particularly needed instruction in, it was rather amusing to me, and I would like to tell you why.

The early part of my life was spent in a large village; later I was, for many years, a teacher in the rural schools. During that time I was entertained by nearly all the families connected with the schools in the various districts where I taught, and for the last eight years I have been a farmer's wife. I am much interested in Grange work and have had an opportunity to visit a good many Granges, thus making a large number of friends among farm women, besides having a chance to know about their ways of living. In all the farm homes where I have been entertained or where I boarded we had good bread and it wasn't baker's either, and the women took pride in their cooking and in serving good wholesome meals, and in keeping their houses clean and orderly. How is it that so many premiums are awarded to farm women at fairs and places where both farm and city women compete if we are such poor cooks? And why do our city friends like to run out on Sunday "to get a good dinner?" I have even had some of mine ask me to bake various things for them when they were preparing to entertain, and wanted everything "to be just right." And yet we need teachers! If you want to eat the very best dinner ever, just go to a Western New York Grange dinner.

A. FARMER'S WIFE.

Take the Wife's Advice.

JANUARY 1st I put a man on my 10-acre farm, under salary, supplying lumber, 720-egg incubator, brooder, and 2,500 eggs. The proposition was that he should get up poultry houses and hatch flock which we estimated would number at least 1,000 pullets laying in October. The result has been 500 pullets and 300 broilers, one house 40x16, one cellar and brooder house over cellar 14x12, four colony houses 12x10 and general clear up of place, which was neglected; no work on land. It is now clear that expenses will not be covered out of 500 hens, and my man states that I must find $1,000 for more buildings and running expenses for one year, to go in bigger, say 2,000 birds in Fall of 1915. I am a city man, my wife most capable, which I am not; ready markets for all produce. Shall I keep the man with the extra risk—or shall we move on the farm and try our own luck with the 500, gradually feeling our way to work? I have set out 200 apple trees this season, and am taking your green crop manuring formulas, having plowed under rye in April—and sowing vetch, etc., among corn in August. Am I safe in expecting 500 hens to produce as follows at least in 12 months: 50,000 eggs, 4,166 dozen at average 30 cents, $1249 gross? G. B.
New England.

Probably the best advice that I can give you is to take the advice of your wife in this matter. She knows you and your circumstances as I do not, and in the poultry business and on the farm the advice and help of a capable wife is worth far more than that any stranger can give. If it is your purpose to make a livelihood from poultry, you will work at a great disadvantage if you attempt to do it at a distance and with hired help. I will not say that it is impossible, but it is certainly highly improbable that you will be able to accomplish it. You have an immense deal to learn, and the only way to learn it is by actively engaging in the business. You should not have expected to produce 1,000 October layers from 2,500 eggs; getting 500 good pullets from that number of eggs is doing well. This is a good start, and under all ordinary circumstances it would be far better to make these pay with the equipment that you now have before investing another $1,000. No, you are not *safe* in expecting 500 hens to lay 100 eggs each during the year; they ought to do it, but dear, dear, how many excuses they can find for neglecting their work! If you are a city man without experience with farm and poultry, you will work at considerable disadvantage in many respects but this disadvantage will be at least partly counterbalanced by your willingness to learn and your eagerness to take advantage of what others can teach you; at the same time my advice to city men in good positions is to go very slowly at burning the bridges behind them as they embark in the poultry business for a livelihood.

M. B. D.

The Woman At Law

[Under this heading we shall discuss the legal rights of women, particularly as regards thier property and their children. There will be direct answers to actual questions and general statements of law.]

Disposing of Property by Will.

I AM going to make a will soon and give all I possess to my only brother absolutely. If my brother dies before I do, can I direct all to be given to my deceased sister's and brother's children, share and share alike, which I would like to do if it would be lawful according to the law of New York State? H. D.
New York.

You may by will legally give all of your property to your brother, with the reservation that in the event that he should die before you, then all your property should go to the children of your deceased sister and brother.

Requirements of Sanitary Code.

I AM writing to see if there is any way to secure justice regarding some of the provisions of the new sanitary code which goes into effect Nov. 16, in this State. According to this "code" it was intended to require a license of every one, everywhere, who sells milk at retail. Also they must have their dairies scored and the grade of milk stamped on the bottle cap. To these requirements no one could justly object but it now develops that only milk "peddlers" are meant while the man with a few cows can sell "any old thing" and go free. This is a manifest injustice. It does not seem right that I be compelled to secure a license while several people in town who keep one to three cows may sell milk without restrictions. What would be the sense of a law allowing anyone to practise medicine without a license so long as he had only a few patients while the skilled physician was required to procure this permission? F. H. T.
New York.

Your position is well taken and your argument well put if your premises are correct. Chapter III of the State Sanitary Code respecting milk and cream provides in part that "*No* corporation, association, firm or *individual* shall sell or offer for sale at retail milk or cream in any city or village without a permit from the health officer thereof, etc." This provision does not seem to limit its scope to *peddlers* merely, but to everyone who sells at retail. And if your local health officer is going to apply it to peddlers only you should lay the whole matter before the State Health Department. The new regulations going into effect November 16, 1914, materially change the present law and among other things provide for the inspection of every farm and dairy where milk and cream is produced for sale.

Right to Property.

IF a widow had four children by the first husband, four by the second husband and if the mother should die, could the first four children claim their mother's third in the property if the second husband was living? This property was accumulated by her second husband? If so, how could it be prevented?
New Jersey. S. J. S.

While the second husband lives, even though his wife die, there would be no distribution of his estate and, of course, the first children could get nothing. The second husband would have to die first to give the wife her dower. This dower of one-third is only for the wife's life, and at her death would go back to the husband's heirs. The mother can always disinherit her children by will and leave her property as she chooses, although in New Jersey she cannot defeat her husband's courtesy.

Verbal Contract; Rental of Farm.

I OWN a farm about 10 miles out of the city which I rent, or let, out on shares. Last year I let the farm out on verbal contract, each of us to buy one-half of the grain and phosphate used, and each to share equally in what the farm produced. My man seems somewhat unreasonable, and says the verbal contract is no good. He also says he can hold one-half of the manure made on the farm and sell it. Will you state if a verbal contract is legal and for how long, and also state if the law in New York State will allow a man taking a farm to work on shares to sell the manure. If the tenant breaks the verbal contract can he be put off of the farm and how? When he took the farm it was mentioned he should have one-half the milk, one-half the hogs, one-half the grain raised, one-half the eggs and chickens and one-half the fruit.
New York. J. W. W.

A *verbal* contract which, by its terms, is not to be performed within a year from its making, is void and cannot be enforced. On the other hand an oral lease of real property for a period not longer than one year is good, and it is a question under which of these rules your agreement comes. In any event your man is as badly off as yourself if there is no contract. He is then a trespasser after you notify him to leave and give him a reasonable time to get off. Thereafter he may be put off by dispossess proceedings. The law recognizes that good farming requires that manure made on the farm be left there, and where there is no agreement otherwise the tenant may not take away any of the manure. There is so much uncertainty on both sides that it would seem under all the circumstances to be a good case to try to come to some amicable arrangement with your man. It will save you both much trouble. M. D.

Trespass.

A CROSSES B's lot; B does not forbid A going and has no signs posted. Can B get a case of trespass against A? 2. A. goes on B's lot and swamp on a road. B says it is all right at the time. Can B bring suit against A and collect damages? A. H. D.
Maine.

1. In a technical sense this is a trespass and B could sue and get damages—probably amounting to no more than six cents. If A crossed the field for a long time and B knew of it and made no objection it would amount to a permission and B could not sue A until he had revoked this tacit permission. 2. B having said it was all right at the time and having given his permission, cannot now sue A for trespass unless A exceeded the permit and did damage.

"You should by all means have an Italian garden." "All right," said Mr. Nurich. "And we'll plant some spaghetti."—Louisville Courier-Journal.

Don't Buy Pumps Blindfolded!

There are over 300 types of pumps—each best for a certain purpose.

Can you pick out, unaided, the one that *will exactly suit* your needs?

Won't you be saving time and money by getting expert advice? Write our Mr. Gould, in care of our Consultation Department. He will advise you from his expert knowledge—help you choose the pump that will best serve you, and at the lowest cost. There is no charge for this service. You may as well have the benefit of it.

GOULDS RELIABLE PUMPS

Before you make up your mind on pumps, in justice to yourself, you ought to investigate Goulds Reliable Pumps.

For over two generations they have held top place. There are more Goulds in use than any other line of pumps made. That's pretty good evidence of their quality. And you'll find Goulds Pumps sold by the best dealers in your town. That's another proof.

We make hundreds of thousands of pumps yearly. This big output enables us to give maximum value at lowest cost. Be sure to look up the Goulds dealer, whether you need a small cistern suction pump or a large power pump.

This Book Free Tells how to have running water any place on the farm. Illustrated with pictures and diagrams. Twenty pages crammed full of pump information you ought to have. By filling out the blank in this book you will, without obligation, get facts and cost of the very pump outfit you require. Write at once.

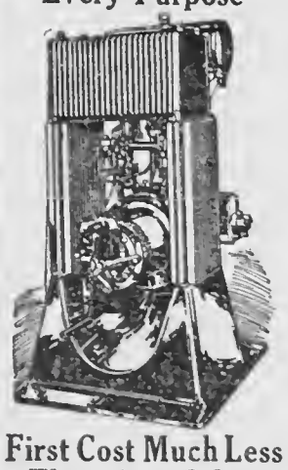
Every Farm Home Can Now Have Electric Light

No Batteries or Switchboards to Take Care of. Electric Current Always Ready for Every Purpose



First Cost Much Less Than Any Other System. Operating Cost Still Lower

THIS wonderful new electric lighting system, only recently invented, is just what thousands have been waiting for years past—a complete electric lighting outfit for the home located in the country or small town, where city current is not available.

It is built in one compact unit,—engine, dynamo and governor. No storage batteries with their expense and care; no costly switchboard. It delivers, whenever you want it, exactly the same kind of current that city people use. With it you use standard lamps and other electrical equipment, such as you can buy from your nearest electrical dealer.

Turn on one or fifty lights just as you choose. Nothing to look after but the small high-speed engine that works smoothly and silently while the lights are on. Pour in oil, gasoline and water once a week, or as needed—that is all the attention required.

Uni-Lectric GASOLINE-ELECTRIC UNIT LIGHTING SYSTEM

The light is the same clear, steady, non-flickering light you get from a central power station. You can use the current for driving small electric motor, electric iron, toaster, vacuum cleaner, or any other household use that current is used for in the city.

This is the ideal electric lighting outfit for rural homes—low in price, economical to run, compact, easy to install, and no trouble to operate. Your wife or daughter can care for it with no expert assistance. It will last for years of constant service, with little or no perceptible wear.

Write today for complete description, literature and let us show you how little it will cost to have electric lights in your home this winter.

:: Hope Farm ::

THE STORY OF A DAY.

ELECTION.—Election day dawned clear and bright. I once worked for a farmer in the West who called such a day "Republican weather." That was the time they herded the "floaters" up like sheep and stood over them while they voted. Call it what you like, the day was perfect. Merrill had started with a load of apples before I got up. These are lively times with the fruit, and day by day the big wagon goes to the county town smelling like a great bouquet all along the road. A Baldwin from our hills—just beginning to "mellow up"—beats a rose for perfume. We are selling our apples early, for later in the season I expect to see a big share of the nation's crop dumped into this territory. Already I see in New York peddlers selling beautiful Hood River apples at three for five cents. So our crop is elected for early sale by a large majority. We have no trouble in selling it all within 15 miles of the farm. I would rather not ship it away.

RED HENS.—The children were up waiting for me, for important events had happened. We had breakfast together. A simple meal—baked apple, oatmeal, toast, coffee and an egg. Then I must come out and see the new hens. You see I have obtained the pen of R. I. Reds which Dr. J. A. Fritchey had at the egg-laying contest. They were second among Reds—laying 1,614 eggs during the year. The 11 hens had come, and the children were greatly excited over them. I have always wanted to try my hand at developing a good strain of poultry. But why select the Reds? They certainly match the children in one way at least, and I think the public will come back to a general purpose breed. The present craze is for Leghorns, I know, but I think it will be overdone and there will be a great future demand for *meat*. They tell me the Reds are "broody," and some say lazy, but I notice the best of them lay when eggs are bringing highest prices. At any rate the children and I make our bow as "Red" breeders! Philip and I plan a house exactly like those used at the egg-laying contest, and the hens will be fed on the same plan. I want to buy one or two of the finest utility males I can get. If possible I will buy the son or father of some hen with a high certified record and see what we can do. Now please do not come after eggs and stock from this pen, for we have none to sell. This first year will be devoted to starting our flock. At any rate, it would not be fair for us to compete with other breeders in the sale of stock. Our plan is to breed in the best lines we can find and enter a pen of our pullets in the next egg-laying contest. I do not know any better way of showing what you have.

WORK.—While Merrill was gone with his load Philip went at the great mound of apples in the cellar, preparing for the next day. The warm Fall has been bad for the fruit, and the Greenings and Spys begin to show decay. We sort over everything with great care, the idea being to give our customers more than they expected. One of the Italians went into the ditch. We are preparing to pipe water from our hillside spring down to the house. This spring was dug out and a concrete cistern built around it. From this the water will be brought to the house so as to give good pressure. Some day I expect to sell this spring water—at any rate, it will now supply the house and give us a chance to irrigate the garden. This Italian is an old mason, who knows how to do such jobs. The other Italian goes to pulling mangels. The crop is fair. We have let it stand as long as seems safe. Now we pull the roots and throw into piles. A little later the tops will be cut and stored for cow feeding, and the roots put into lime bags for sale and storage.

YOUNG FINANCIERS.—School does not begin until nine o'clock and the children all ask for a job. They are put at pulling mangels. No, the Hope Farm children are not models of industry. They want to earn some money for a special purpose. Our children are not given spending money, but they are paid for their labor. The boys want to buy a bicycle, but Mother tells them they must first show a balance in the savings bank of $50—then they can save for the wheel. The first bank deposit was made four or five years ago. Now one of them has over $50 and another about $48. Thus they are hunting for "jobs" in order to elect that wheel. They pulled mangels until the school bell rung. I peeped into the school room and saw Mother drilling our little folks and some of the neighbors' children—then I went back to study the new hens. I might have had a nomination for Congress in our district this year, but up here on the hills to-day I am satisfied that I stand a better chance for election by these Red hens than I ever could at the hands of my fellow citizens. I have an optimistic friend who figures this way: These 11 hens ought to give you 2,000 eggs. Suppose you sell 20 sittings at $6 each and hatch out and raise 100 each pullets and roosters, and then sell 90 dozen eggs at an average of 30 cents. See what you have:

Sitting eggs	$120
100 pullets at $3	300
100 roosters at $5	500
Eggs	27
Total	$947

I presume that even a Prohibitionist might become intoxicated on figures and still retain his party standing, but this is too much for me. It is not unlikely that more than half of this sum could be obtained from a pen that won first prize at our egg-laying contest. I know that breeders ask $20 and more for a single bird guaranteed to be brother or son of a high-record hen. I have no dreams of any such windfall blowing off the Hope Farm plum tree, but somewhere along this line lies opportunity for some patient young man.

THE FARM.—I try to make it a point to look into every nook and corner on election day. Formerly we always planted trees, but I have given up Fall planting. I well remember the election day when we planted our first orchard. At night I looked to the west and there were those little sticks on the hill standing up against the glowing sky. They looked puny enough that night, yet this Fall we picked over two barrels of apples from some of them. We may be able to elect our hens in much the same way. The farm never looked more promising than it does to-day. The strawberries are clean and have made a fine growth. Both peach and apple trees are loaded with fruit buds in spite of what they gave us this Fall. All over the hill the cover crops are bright and green, and next year we can again plow under the equivalent of eight tons of manure per acre—a free gift in return for our seed and seeding. He who puts his faith in political parties may or may not be elected, but rye, vetch, turnips and lime are sure as the sunrise. The corn fodder is fit, the mangels and carrots are ready—the farm never had greater cause for Thanksgiving. There is no rye growing on the mangel field to be sure, but the little swamp is close by, and we can haul out 30 loads this Winter, compost it with lime and spread it in Spring.

DINNER.—Merrill got back about noon. Tom and Broker, the big gray horses, were tired, and their stalks and grain tasted good to them. We all lined up at dinner and made a tableful—though the first brood has grown too large for the old hen and gone out to work and school. We made an even dozen at dinner. There was a good stew, potatoes, beets, onions, hominy, bread and butter, baked apples and canned peaches. That is all this was in sight when we started. I do not speak of what was in sight when the last child was satisfied. You ought to read in the last *Atlantic Monthly* about the two little colored boys who never seemed to have enough to eat. As a last resort the cook proceeded to "stall" them—that is give them plate after plate until they could not possibly eat more! We never tried that, but even after this great dinner the children filled their pockets with apples before they went back to pulling mangels. I pulled with them for a while, and then went at the apples. There was another big load to go in the morning, and also four barrels to be shipped by freight. Merrill and Philip packed these while I went to vote. Years ago I was president of a campaign club and went around picking up the voters. It is against our laws to do that now, and I am glad of it. I just walked into a booth, marked my ballot and voted. The men I voted for were not elected—except in one case where there was only one candidate—but that was my business, and I had to be satisfied. When I got home the children were lined up for a new job. It seems that I had agreed to show them how to kill peach borers, so I sharpened up our knives and started in. It is getting rather painful for me to get down close to our low-headed trees, but the children crawled under the limbs like cats. I taught them to hunt for the gum and the "sawdust" in it, as sure indication of a borer. When they found the burrow they learned how to cut *down* and not across the trunk until they found the rascal at work. When they get a borer they put him in a bottle as proof of what they have done.

NIGHTFALL.—The November day ends early up among our hills, and there comes a sharp chill in the air as the sun goes low. The children had their early supper of bread and milk, and then ran out for a last look at the Red hens, and the black calf, and for a last round of play. Mother has been writing letters and sewing, and she was glad to come down to sit before my roaring open fire. Merrill went with the freight and voted before he returned. Philip brought up the cow and did the chores. The big wagon was stuffed so full of apples that the side curtains bulged out. It was all ready for the trip. In the early morning Merrill will hitch the grays to it and off they will go through the frosty starlight in order that a dozen households may have apple sauce and pie. The mangels are all out, the ditch is ready for the pipe—and here comes the call for supper. To-night it is baked beans, pot cheese, salad and baked apples.

I have known people who shudder at what they call the "lonely country nights!" No shudder comes to us as we pull down the shades and get ready for the evening. Before my fire as I write the little boys are studying a catalogue and comparing prices of bicycles. Mother is at the telephone chatting with friends who live a dozen miles away. If need be she could reach both of the big girls at school and college over the long distance. I look out into the bright starlight and am thankful that we can have our home up here among the quiet hills and enjoy this second brood of children where they can remain natural little boys and girls. In town and city men and even women are excited and nervous over the election—here among the quiet and lonely hills at the end of our working day we can appreciate Whittier's old-fashioned poem, which so truly pictured the thought of country people in those bitter and trying days of the war:

* * * "We have a country yet
The praise, O God, be thine alone!
Thou givest not for bread a stone;
Thou hast not led us through the night
To blind us with returning light:
Nor through the furnace have we passed,
To perish at its mouth at last.

Volume---Quality

VOLUME is our watchword--QUALITY our motto. Quality—**Galloway engine quality**--has made our tremendous volume possible. Skilled workmanship, best materials bought in large quantities, simplicity and perfection in design, and supremacy in power are why I call this new 6 h. p. (horse power that is horse power) Galloway's MASTERPIECE.

Get My New 1915 Proposition

It's new and different. **Listen!** Don't buy an engine of any make, kind or at any price until you first get my new 1915 proposition and sliding scale, price reducing schedule. It's an eye opener--**a profit sharing surprise to everybody.** The more we sell, starting in September 1st, 1914 and ending September 1st, 1915, the more we still reduce our price from this already low figure and **you get the benefit.**

Look Over These Specifications

Double ball type governor; Hercules cylinder head, extra large cooling surfaces around cylinder and cylinder head; larger water po. than ever, easily drained, frost proof, a low speed, heavy duty, heavy weight, big bore and long stroke engine; elevated main bearing grease cups, heavy cast bracket supporting gas tank, cast iron guards over crank shaft, special designed Economy Carburetor (easy to start in cold weather) improved piston lubrication and gear driven built-in magneto (extra) but one wire from magneto to igniter.

Ask For My Free Engine Book

Send a postal now for our new 1915 proposition and valuable engine book that is full of engine information, pictures and letters from satisfied customers that tell the absolute truth about Galloway engines. It's yours for the asking.

Wm. Galloway, Pres., The Wm. Galloway Co.
275 Galloway Station Waterloo, Iowa

"DEYO"

It's all very well to claim an engine is frost proof, but with us the Deyo Engine has simply got to make good on each and every claim we make for it. And when you buy an engine from us it is with an absoluto guarantee that the

Deyo Portable Engine

Will Not Freeze Up

and that it is in every other particular exactly as we claim or you ship it back, at our expense, and we refund every penny you paid us. If you have any doubt as to the value of our guarantee, just write to any one in Binghamton. Write to-day for our illustrated Booklet about the Deyo 3½ to 20 H. P.

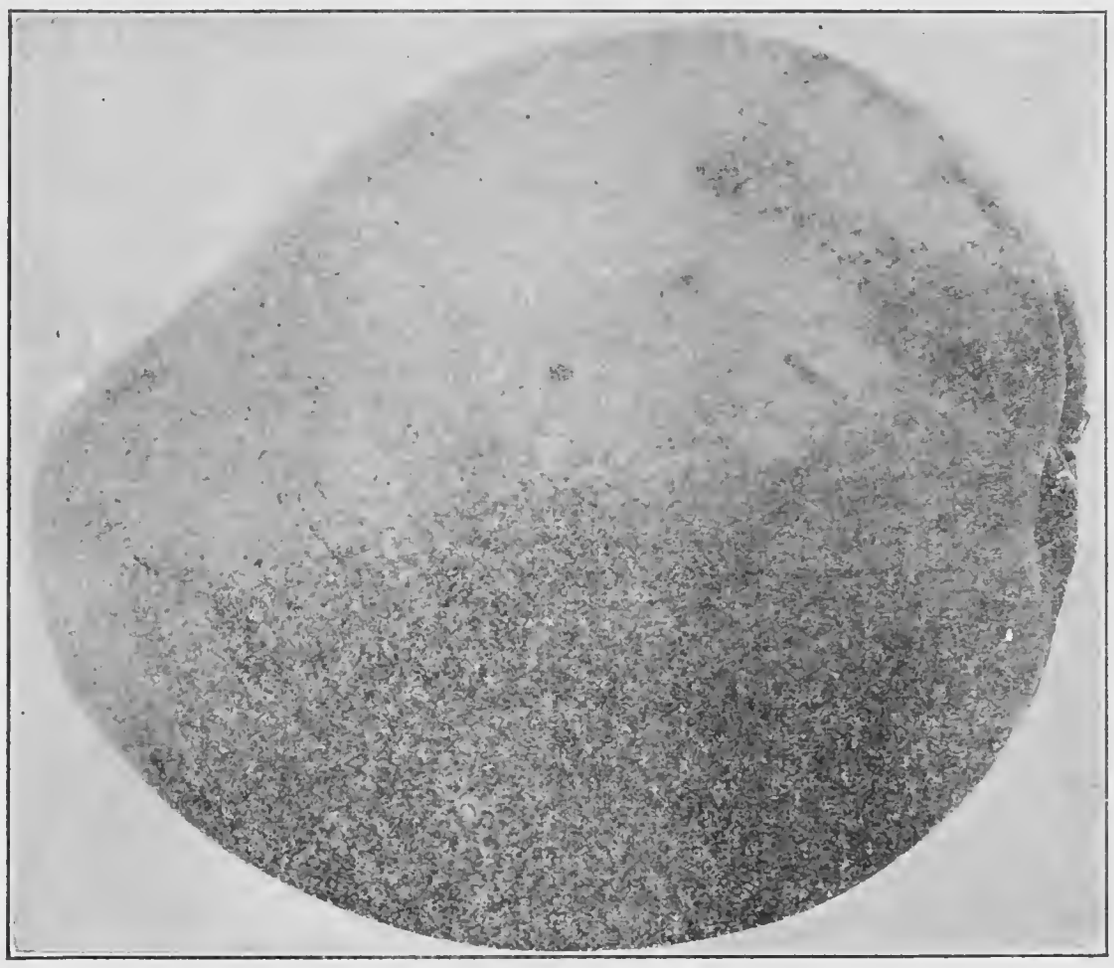
:: Ruralisms ::

THE ROSE MANGO.

THE mango is a tree belonging to the Cashew nut family common throngh India and Malaysia, and now widely introdueed through the West Indies and tropieal Ameriea. It is very variable in shape, size, color and quality; sometimes the fruit is rich and melting, sometimes so stringy and ill-flavored that it is likened to tow soaked in turpentine. The



THE ROSE MANGO, OR MANGA DA ROSA. FIG. 593.

specimen shown in Fig. 593, known as manga da rosa, or rose mango, is a superior form grown on a commereial seale at Pernambueo, and to a less extent along the Brazilian Coast. It is reproduced from a photograph secured during the reeent Brazilian expedition sent out by the Department of Agriculture, which was published in Bulletin No. 99 from the Office of Foreign Seed and Plant Introduction. This rose mango, supposed originally to have come from Mauritius, is a very handsome fruit, deep apricot, overlaid with salmon and flame eolor, the flesh deep yellow. The quality is agreeable, and the fruit has excellent keeping and shipping qualities. The bulletin states that large quantities of this mango are shipped from Pernambuco to Rio Janeiro, and there sold at 65 to 80 cents each.

Mangoes vary in form, some being kidney shaped and some rounded; they weigh from one-fourth to three-fourths of a pound. They are occasionally grown under glass in Europe, both in botanic gardens and private conservatories.

Fruits for Home Use.

WILL you give me a seleetion of the following trees for private use on plot 67x200? Six apple trees; four pears; four peaches; two plums; 10 grapevines. A. T.
Wortendyke, N. J.

The following selections are exeellent varieties for family use, and will be found very satisfactory: Apple: One Early Harvest, one Sweet Bough, one Gravenstein, one Twenty Ounce, one Baldwin, one Winesap. Pears: One Bartlett, one Clapp's Favorite, one Worden Seekel, one Lawrenee. Peach: One Carman, one Elberta, one Mountain Rose, one Iron Mountain. Plums: Lombard, October Purple. Grapes: Two Moore's Early, two Moore's Diamond, two Concord, two Coco, one Worden, one Campbell's Early. K.

Starting a Nut Industry.

THE English walnut is a great industry in some localities for the simple reason that some observing farmer of by-gone ages picked out the best trees from among thousands of wild trees and propagated them. That is the way we got the Baldwin apple, and all our other fruits. You would be rich if you had an orchard of trees like the best Black walnut growing in America, or the best English walnut, or the best hickory, or the best northern pecan, or the best hazel nut, or the best persimmon. The trouble is that we do not yet know where these trees are, but they are probably growing on the farms of some of the readers of this paper. We now know how to propagate these trees, so all that is needed is to find parent trees. Can't you help? If you know of a promising tree, send a description of it and its bearing history, along with some of the nuts to Dr. W. C. Deming, Secretary of the Northern Nut Growers' Association, Georgetown, Conn. You may get one of the $5 prizes that the association is offering for the best hickory, walnut, or hazel tree that is an improvement on those already known. The Northern Nut Growers' Association is doing pioneer work in this line, and the results of the competition will be reported in this paper. J. RUSSELL SMITH.

Immune Chestnuts; Filbert Cuttings.

HAVE the European and Japanese chestnuts been tested thoroughly in respect to the chestnut bark disease, and are they immune? Is the chestnut bark disease the thing that has weakened the chestnut in the South? 2. Will filberts grow readily from cuttings, as stated by some? E. R.
Brownsville, Ore.

1. The European and Japanese species of the chestnut have been tested and found to be less subjeet to the blight than our native species, but they are not immune to it. The disease has existed in China for ages, perhaps, and it was brought here by importing chestnut trees. This disease has spread southwestward from New England and has done untold damage to the cultivated and wild trees as far as Maryland, and is progressing steadily onward. There are several regions in Virginia that are infeeted but efforts are being made to stop the disease. Burning every part of the affeeted trees is the only way to destroy the germs. No trees or scions should be got from any infested region.

2. Filbert eutting may be rooted but with diffieulty. The best way to propagate the plants is by banking up the bushes and inducing them to strike roots, when they may be ent off and transplanted. It is also practieable to grow seedlings and bud or graft them with the approved varieties.

H. E. VAN DEMAN.

Care of Apple Trees.

I HAVE an apple orehard about three years old; trees healthy, but were trimmed to exeess two years ago, and do not bear very well. The ground has not been plowed in four or five years and is in sod now. Would it be well to plow this Fall and crop in Spring? G. H. B.
Jackson, Mich.

An apple orchard that is 30 years old ought to be in good bearing condition and excessive pruning and lack of culture are probably accountable for the scarce fruitage. It would be well to plow the ground this Fall and next Spring begin early to cultivate it with disk and spring-tooth harrows, which should be kept up until August first, going over it after every rain to keep the moisture in the soil. It would be well to spread some stable manure on top of the ground after the plowing and let its substance soak in to add fertility. No crop should be put in until next Fall, when some eover crop like Canada peas or vetch should be sown.

H. E. VAN DEMAN.

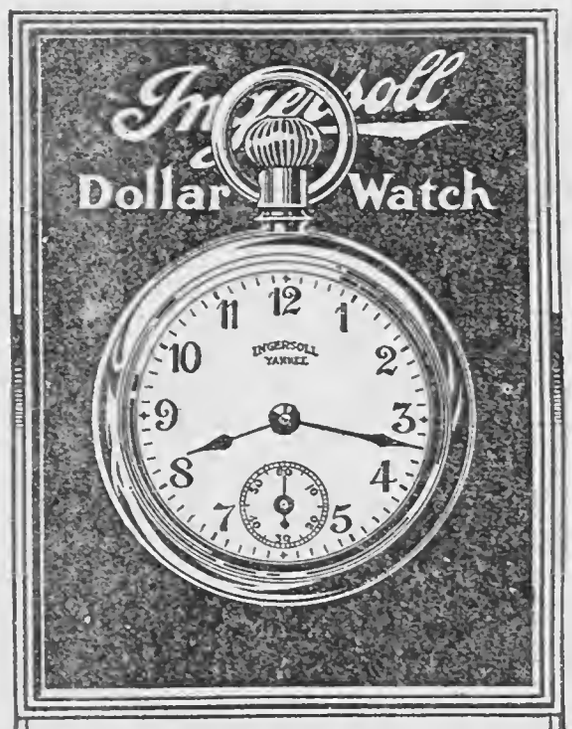
Protecting Your Seeds.

WHEN you put away your seeds this year, try putting a few "moth balls" in with them to prevent the development of weavils, worms and bugs. There are other remedies and good ones, but they are mostly bothersome or dangerous, and also the best of them kill the destructive "critters," but they do not repel the invaders in the first place or avert whatever damage they do before they are killed. Garden pea seed is greatly subjeet to weevil, and other seeds seem to invite destructive bugs and worms, but the moth ball appears to change all this and entirely discourage the pests. Your pea seed need not come out in the Spring full of holes, nor your other seed in bad order, with vitality much reduced. Put your seeds into clean, dry saeks and in each quart of seed of any kind distribute say three moth balls. In smaller packages put one moth ball, of course, or even half of one. The seed does not seem to be injured by the moth balls, but their odor is the most effeetive "keep out" sign for destruetive vermin that I have found.
ROBERT S. DOUBLEDAY.

R. N.-Y.—These moth balls are recommended by gardeners for repelling vine insects. As for weevils a treatment with bisulphide of carbon so often described in THE R. N.-Y., will prove sure death.

The Black Walnut.

I NOTICED an article in a recent issue from M. H. M., Virginia, inquiring about the price and market for Black walnuts. The market and demand should be better for this delicious and valuable nut; the English walnut does not compare with it in flavor, when used in bread and cake, conserves or candy, or when eaten out of hand it is delicious. The difficulty in cracking the Black walnut is it only drawback, but its fine flavor is well worth the extra work. Boost the Black walnut. E. E. B.
Minneapolis, Minn.



The Costly Treasure of Kings is now the Possession of Millions

The first watch ever made was created for a king, and was priceless. It was the marvel and envy of all who had the privilege of seeing it.

As time sped on, other kings and men of great wealth had watches made for them, but the common people never even saw them, and heard about them with wonder.

Then, there came a day, when a dreamer conceived the thought that a device as universally needed as a watch should be the possession of every man, woman and child.

He conceived the Dollar Watch. Today 40,000,000 have been sold. Today the Ingersoll Dollar Watch that you will find in 60,000 stores throughout America, is infinitely better than it has ever been, but the price remains the same—the same in the big city store, and the smallest store at the crossroads.

Look sharp for the name "Ingersoll" on the dial—the mark of the good time-keeper.

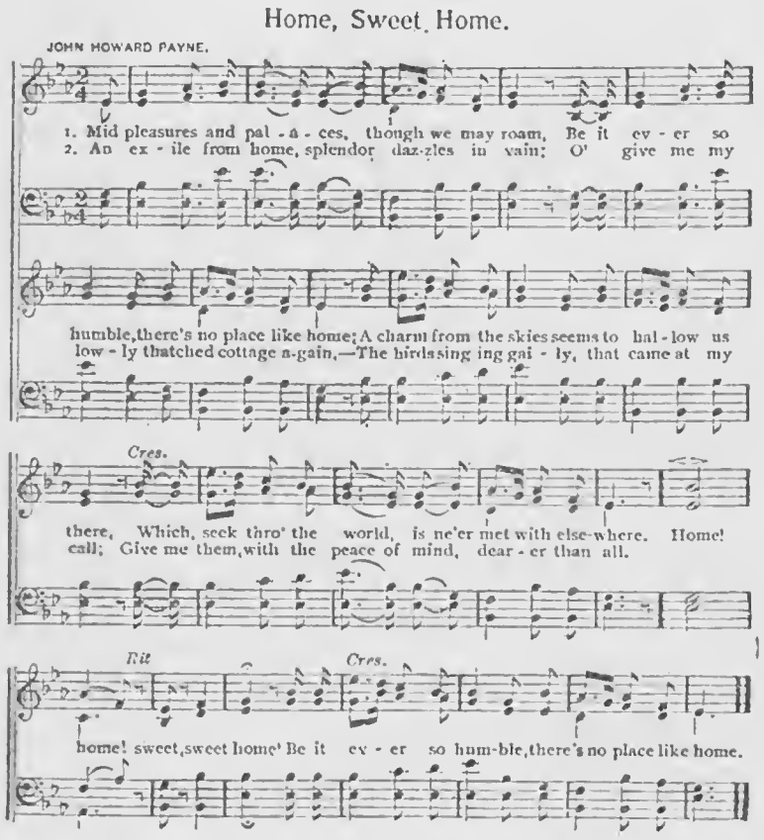
"A SQUARE DEAL"

We believe that every advertisement in this paper is backed by a responsible person. We use every possible precaution and admit the advertising of reliable houses only. But to make doubly sure, we will make good any loss to paid subscribers sustained by trusting any deliberate swindler, irresponsible advertisers or misleading advertisements in our columns, and any such swindler will be publicly exposed. We are also often called upon to adjust differences or mistakes between our subscribers and honest, responsible houses, whether advertisers or not. We willingly use our good offices to this end, but such cases should not be confused with dishonest transactions. We protect subscribers against rogues, but we will not be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent to us within one month of the time of the transaction, and to identify it, you should mention THE RURAL NEW-YORKER when writing the advertiser.

Home, Sweet Home.

JOHN HOWARD PAYNE.



*

AT the request of many readers we print on page 1383 a careful article by Dr. Alexander on the foot and mouth disease. As will be seen, this disease is highly contagious, while not necessarily fatal. Every precaution should be taken to stamp it out promptly and prevent its spread. It should not have been permitted to gain such headway. The daily papers, as usual, are widely trying to create a scare by talking about increased meat prices. Our reports indicate that the quarantine will soon be raised and normal shipments resumed.

*

AT Toronto, Canada, efforts are being made to advertise the apple crop by giving part of it away. Farmers, the Salvation Army and owners of auto trucks combine in this work. The farmers give windfalls, the "Army" provides pickers and distributes, and the trucks bring the fruit to the city. Business men contribute bags. With the apples goes a circular telling how to cook and dry them. While thousands of bushels of fruit rotted on the ground or brought barely 50 cents a barrel consumers in Toronto were paying $3.50 at retail. If this same auto service and distribution could be used for selling apples as well as for giving them away both producer and consumer would be better off.

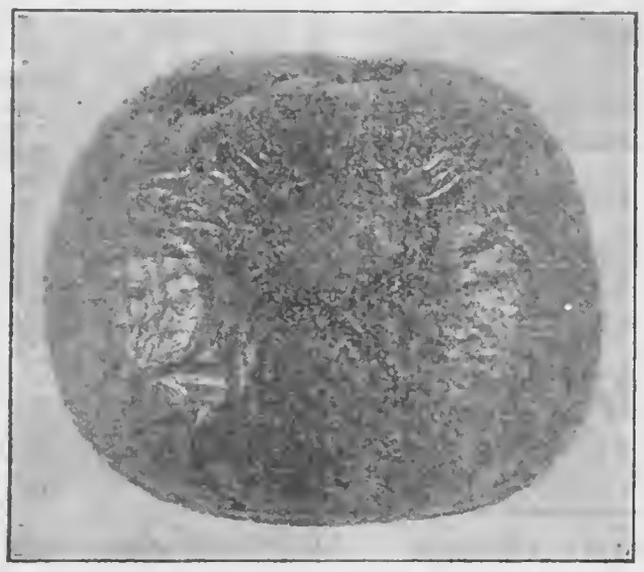
*

CONNECTICUT dairymen and hennen have reason to be thankful this year for the work of their experiment station. The worst disease affecting poultry is white diarrhœa. There are bowel troubles which may result from chills, poor feeding or other causes, but the scourge of bacillary white diarrhœa is a germ disease. It is spread from one fowl to another, and the germ may be put into the egg from the hen and thus developed *into the chick hatched from that egg*. Some hens are infected with the germ—others are not. In a flock of 100 hens from five to 50 or more may contain the germs of this disease and as long as they remain there is danger to both hens and chickens. Safety lies in getting rid of the infected birds. Now the Connecticut Experiment Station has found the germ and perfected a test for detecting it in the hen. A few drops of blood are taken from a vein in the wing and a simple test quickly shows whether the germs are present or not. For a small sum of money the station will test the birds in any Connecticut flock and thus enable the owner to clean his flock absolutely of the disease. It is doubtful if any station in the country has made a more useful or practical application of scientific research than this. Perhaps the chief trouble which dairymen have to contend with is contagious abortion. This is another germ disease—with a certain resemblance to white diarrhœa in some of its details. So long as there is a cow in the herd carrying the germs of this disease there is danger of spreading it to all the other cows. Some cows, like the hens with white diarrhœa, carry the germs, while others do not. Some carry the germs, yet do not suffer the final results. They are like the humans who carry the germs of typhoid fever—not themselves sick, yet a constant menace to all around them. No dairy herd is safe so long as any of the cows carry these contagious germs. The only way to make the herd safe is to get rid of the germ carriers just as is the case of white diarrhœa. Now this abortion germ has been identified and a test devised for it. As with white diarrhœa a small quantity of blood is taken from each animal and submitted to a laboratory test. If the abortion germs are present they are promptly identified and this cow can be taken out of the herd. If they do not appear in the blood the cow is free and the disease could not come from her. The station is prepared to make these tests with hens and cows. It is one of the most interesting and useful services ever offered by the experiment station and right in line with what seems to be the true work of these institutions. If this work could be thoroughly followed out these fearful scourges of hen and cow would disappear from the State.

*

WE do not often use pictures on this page, but now and then the occasion seems to warrant it. Have a look at this apple (exact size, and then read about it:

In this mail I send you a small apple with a large scab, which was offered to tempt my palate at a hotel



last week. Right across the street was a large electric sign reading "Get the Apple Habit." I think the fruit growers in the East should get the packer's pride, and have signs on their farms reading "Get the Grading Habit." It would be the best advertising investment they could make. H. H. ALBERTSON.

We omit the name of the city—it is a large place close to a great fruit growing section. This disgraceful specimen never should have left the orchard. It is not even fit for cider, yet in this year when growers cannot get rid of their best fruit this worthless scab is used to shock and disgust visitors and would-be apple eaters! There is little to be thankful for when such things occur. They injure the trade and the business of the thousands of honest growers and packers who try to give a square deal. Such an apple is the worst possible advertisement for fruit growers.

*

THE produce trade, irrespective of partisanship in politics, is very much tickled over the election of Eugene M. Travis, one of its own members, to the important position of State Comptroller, to succeed William Sohmer, the present Democratic holder of the job. Mr. Travis was bitterly and venomously attacked by THE R. N.-Y. for his attitude on the original Roosevelt bill afterwards amended into the Cole law. The editor of that paper called upon the York State farmers to rise up and smite the ex-Senator. The funny part of it all is that it was the farmer vote that elected Mr. Travis.—Fruitman's Guide.

It is true that for several years Senator Travis fought the bill to regulate the sale of country produce through commission houses, and because of his opposition to the just interests of producers THE R. N.-Y. did not think Mr. Travis entitled to farmers' votes. It is no wonder that the *Fruitman's Guide* should think it "funny" that the farmer vote should elect Mr. Travis under the circumstances, and yet the "funny" part of it is true. THE R. N.-Y. had no personal fight on Senator Travis. He is a pleasant gentleman and a good fighter, but we believe that if farmers ever hope to get fair treatment, they must show a united front in favor of those who treat them fairly and against their enemies. We do not assume to tell farmers how to vote, but it is our business to furnish the information. In this case farmers apparently voted without regard to past records, and the organ of the commission men is entitled to make the most of this victory. If the Senator who takes Mr. Travis's seat works for the commission men as he probably will, he will be sure of their support when he asks for it. We must take lessons from the commission men. They reward their friends and punish their enemies. Their papers think it "funny" that farmers should reward the man who fought them so persistently. We think so, too.

*

IT will mean Thanksgiving to this generation and those to follow if we can put the business of producing hickorynuts on a sound commercial basis. To do this we must have superior parent trees. These have been discovered and named with pecans so that superior varieties can be propagated as simply as Baldwin apple or Elberta peach. We want hickories of superior quality. Where are they? Off in the woods somewhere. He who finds them and makes them known lays the foundation for a great future business. This may seem to you like "the voice of one crying in the wilderness," but some day the hickorynut crop of New England will rank as a great asset.

*

WILL you give me the name of the old gentleman whose picture appeared (sitting by the corn shock husking) on the front cover of THE R. N.-Y., October 31, 1914? It seems such a perfect likeness of one very near to us. We shall consider it a great kindness and favor if you will comply with this request, and if our suspicions are correct shall indeed treasure the picture very highly. MRS. F. N. S.

Somehow this picture has attracted unusual attention. One woman in Central New York says it looks so much like her dead father that she was shocked on opening the paper. A man in Western New York writes thanking the Hope Farm man for having his picture printed. There is a citizen in his town who claims to have seen the Hope Farm man and promptly identifies him in this picture. The truth is that we do not know who the husker is. The picture was bought, in company with others, and printed because it presented a true and homely presentment of farm life. The man husking corn by the shock is typical of hundreds of fine, elderly farmers to whom an Autumn day brings old memories which are reflected in their attitude and expression. No wonder this striking picture made many a man and woman think of father or of some old friend.

*

OF course I want the paper, for reasons that would take too long to state here, and would be only a repetition of what you have so often heard. But one of them is the feeling that you run a paper in which the performances of the average man are chronicled, and the ones that one can reasonably expect to duplicate if he is careful and on the job. I consider that to print the story of the exceptionally expert man, in such a way as to give the impression, that any man can do as well, is the most insidious kind of lying. B. E.
West Virginia.

We have much to be thankful for when we receive such notes as the above. This man gives expression to what we are trying to do with THE R. N.-Y. better than we can do it ourselves. We do try to chronicle the "performances of the average man" because in such performance lies the hope of society or progress. Men who might be ranked above the average give us theory or set us a high example, and those who seem content to rank below the average drag at the wheels and pull back. The great hope of the world—future as well as past—lies in this "performance of the average man" and the possibility of constantly adding a little of quality and power to that performance. True education seems to us one long study of human nature so that we can graft upon it what it can fairly absorb of the world's legacy of wisdom. The "average man" is the citizen to be most thankful for. Do not for an instant imagine that we would belittle the great work of educated and naturally gifted men who rank far above the "average." What they do is glorious and worthy of all respect, but the world will only receive full benefit from their work when it is adapted and simplified so as to become a part of this "performance of the average man."

BREVITIES.

HOW the cows do love carrots, and how the carrots return that love!

SPEAKING of the fruits of the mind—a grouch must be the citrus fruit.

LITTLE museums for trees and shrubs are suggested for New Jersey schools.

PUTTING a dot on the I means letting others tell your good deeds—a blot on the I means talking too much.

REMEMBER that pumpkin pie is a good remedy for kidney trouble. Of course you must take frequent and large doses to get results!

THE latest is a silo, dairy, and hog cholera train in South Dakota. This train carries speakers who talk these three important subjects.

IF you can't afford a turkey—eat a hen. If the hen is out of sight then to poultry say "good night," thank the Lord for what you have and say "Amen."

ON page 1298 we printed a letter from a man who tried to tell the truth about his modest outfit of assets as a farm manager. Already nearly 10 people have come to learn more about him.

WOMAN AND HOME

"According to Jimmy"

A Farm Thanksgiving Story

By Harry Ayres

"GOOD mornin', Mis' Holcomb. Here's some doughnuts Maw sent over. She said to be sure and tell you they ain't very good, 'cause she was so busy about sump'n else she couldn't tend to 'em the way she orter. They're all right though, or she wouldn't a sent 'em. She allers talks thataway."

"No, thank you, Mis' Holcomb, Maw let me eat all I wanted 'fore I come. She said if she let me stuff myself as full as I could hold 'fore I started she'd feel reason'bly sure you'd get all she sent."

"No, I can't come in, 'cause I got to tend my traps. Yes'm, I caught 14 muskrats and three skunks already! I wanted to start a farm with the skunks, but Paw, he sez he never knowed nobody make any money at skunk-farmin' outside the papers; but he's seen several 'at lost what little reppertation they ever had."

"Yes'm, I ain't got no cause to complain. Maw sez she's glad they didn't have to call on the doctor, an' Paw asked me if my legs was hollow. Maw said if they was it was easy to tell which side I inherited 'em from, seein' as me an' him et more'n all the rest put together."

"No'm, it started out to be the worst Thanksgivin' we ever had. I guess Maw must of got out the wrong side o' the bed, 'cause theye wa'nt nothin' right an' she got Paw goin' 'fore he got through washin' up for breakfast after milkin'."

"Jest as Edith brought on the second helpin' o' pancakes Maw sez, 'You goin' to church this mornin', Ezry?' "

"'Well,' Paw sez, 'I thought I would, but after the rakin' over I've had this mornin' I don't feel as much like it as I did. I can think o' lots more to grumble over an' lots less to be thankful for 'n when I got up. Milk ain't bringin' what it orter, considerin' the cost o' feed; taters are a dollar a bushel, but that don't do me no good, seein' as we'll have to buy next Spring. Last year we had taters to burn, an' it was hard work to give 'em away; this year they're out o' sight an' we ain't got enough for ourselves. Last year we didn't have no stock to sell, an' prices were higher'n a kite. This year we got lots to turn off, 'n everybody is givin' 'em away. That's the way it goes! If I was to strike a gold mine on this farm the price o' gold would drop to 10 cents a pound. Then Henry's goin' off has hindered me a lot. He was worth two hired men. I can't think what ailed that boy, lessen it was the way you throwed Bertha Somers at his head.' "

"'Why, Paw, how you do talk,' sez Maw. 'I do think it's sinful to fly in the face o' Providence thataway. If I set out to do it I could think o' lots more to complain of 'n you've got. But I ain't that way! I believe in countin' my blessing's. I got 40 hens in the henhouse, 'n ain't seen a egg in a month. I reckon you folks don't need to look for any Christmas presents from me this year. I'm sure I'm thankful for health an' strength, but if you'd had the neuralgy the way I have this Fall, I guess folks 'd a heard more about it. But I ain't the one to complain! There's Jimmy—five nights hand-runnin' I set up with that boy, an' he with the worst case o' mumps I ever see! An' all I could get out o' you was, that if I wanted to make a martyr out o' myself nothin' nor nobody could stop me!' "

"Paw started to say somethin', but Maw, she drawed in her breath quicklike, an sez, 'Lemme have my say, Ezry, an' then you can have the floor. I know just what you're goin' to say, anyhow, so you might as well save your breath to cool your pancakes.' Then she lit inter me. 'You, Jimmy, a body'd think butter was 10 cents a pound an' syrup as free as water, the way you slap 'em on! Edith, don't fry no more cakes, or your Paw an' Jimmy'll bust. Poor child! She don't eat enough to keep a hummin'-bird alive. I know it ain't Christian-like, but I sometimes feel like wringing Sheldon Whitaker's neck! It wa'nt bad enough for her firm to bust up owin' her eighty dollars hard-earned money an' throwin' her out of a job, but she must come home an' find her feller gallivantin' around with another girl—Edith, *I'm* talkin' now. I know you don't like it mentioned, but *I've* got some spunk left if nobody else ain't.' "

"Me'n the hired man was afraid Paw 'd git the last o' the cakes an' syrup, but he got up from the table when there was

A FARM FAMILY TO BE THANKFUL FOR.

three left yet, an' so I took two an' Sam took the other—Sam got the syrup pitcher first, though, an' he didn't leave me but just the drainin's. Paw went an' laid his hand on Maw's head, an' he sez, 'You know as well as I do, little woman, that Sheldon ain't to blame. Edith's give him the cold shoulder ever since she got the stenography bee in her bonnet, an' I'm afraid you've encouraged her. I'm sorry, 'cause she could go lots further an' fare lots worse. Sheldon's a *man*, an' right down in her heart Edie knows he's the man for her; but bein' a woman she wouldn't own up to it an' won't now, though she's eatin' her heart out 'cause she's afraid another woman 'll get him.' "

"'Well, Ezry,' sez Maw, 'If that ain't the meanest thing I ever heard! An' you her own father, too! If that's the way you feel about it I've nothin' more to say. But it's well she's got a mother to stand up for her—Edith, *I'm* talkin'! Well, go upstairs, if you want to—that's the thanks I get! It does beat me! I tried to help Henry with Bertha all I could an' he left for parts unknown, an' now my daughter's takin' it the same way. Oh, dear! If I only knew that my boy was safe and well I'd feel more like Thanksgivin'."

"When Maw begun to cry Paw put his arms around her an' sez, 'There, there! Little woman, I guess Henry's all right or we'd a heard from him before this, an' Edie'll come out all right too. As soon as Sam gets back from the milk-station we'll all go to church an' try to be thankful, anyway.' "

"Well, Maw'n Edith cleared up the breakfast 'n me an' Paw watered the stock an' cleaned out the stables—leastwise Paw did, 'cause I went to look at my traps an' forgot. Then we all put on our Sunday clothes an' started. Everythin' was all right 'till we got on the State road an' Glenn Phillips scooted by us in his auto."

"Sez Maw, 'If you was as forehanded as Glenn, Ezry, we'd be goin' to church in our car, 'stead o' behind a farm team.' "

"'Well,' Paw sez, 'If I got to foreclose honest, hard-workin' men out o' house an' home an' beat down the price o' farm produce below the cost o' growin' it to ride in a auto I'll take walkin' for mine, though I ain't ashamed to ride behind a four-hund'red-dollar team when they're paid for with good, clean money. As to forehandedness, if Glenn fell into Mud Creek, some fool that ought to know better 'ud fish him out, an' he'd come up with his white shirt all fresh laundered with diamond studs in it, an' one hand 'ud be full o' twenty-dollar gold pieces an' the other full o' first-class mortgages.'

"There was another honk, honk! an' 'Squire Parsons whizzed by.

"'I ain't doin' it to hurt your feelin's,' sez Maw, 'but Cliff Parsons rides in his own car, too, an' I'd like to know what you can say against him.'

"'I can't say nothin' against him,' Paw sez, 'an' less for him. He's neither cold nor hot—not spunk enough to do wrong nor ambition enough to do right. His mission in life is to hang on to what his dad left him an' spend the interest on hisself. How'd you like to change places with his wife?'

"That riled Maw. You know how poor Mis' Parsons has do her contributin' to the church with her hands an' look the other way when the plate comes 'round.

"Yessum, I feel sory for her, too. Everybody does.

"Well, the preacher prayed an' the choir sung, then the preacher read the President's proclamation. Maw nudged Paw an' sez, 'You see, the President believes in Thanksgivin'.'

"'So'd I, if I was gittin' fifty thousand a year,' sez Paw.

"The choir sung again an' the preacher preached 'till I begun to think quittin'-time never would come. Maw commenced to cry again, and Paw patted her hand. When I'd give up expectin' to see that turkey 'till supper-time the preacher stopped preachin' an' went to talkin'. He said they'd now offer out o' their abundance to the poor. Paw an' Maw an' Edith put sump'n in. So did most everybody else except Glenn Phillips an' 'Squire Parsons. They didn't, 'cause I watched 'em.

"Well, we all sung 'America,' an' as we was goin' out Sheldon come up an' asked Edith if he could drive her home. Maw told Paw she'd a-seen him in Halifax afore *she'd* a-gone with him, but Paw said Edie had good sense.

"We stopped for the mail an' there was a letter for Edith from the business institute. Maw said they'd orter be ashamed to write to her after takin' her good money an' then gettin' her a position with a dishonest firm. Paw sez, 'Wait till we hear what's in it, little woman, then we can judge better.'

"Well, sir! when we got home, who do you think come out to meet us? Old Hank! An' all dressed up fit to kill! Seem's if he never would let up huggin' an' kissin' Maw with one hand an' shakin' hands with Paw with the other. Then he started on me, but I skun out with Sam to put the team out. Then Henry called me back.

"When we went in there was a strange lady there. Henry went up to her an' took her hand an' led her to Maw. He sez, 'This is your new daughter, mother—next to yourself, the best little woman in the U. S. A.'

"Maw looked at her kind o' funny for a minute, an' then they flopped into each other's arms an' hugged an' kissed the way women-folks do. When Paw's turn come he shook hands an' kissed her. He sez, 'Welcome, daughter. If you ain't Jim an' Mandy Hubbell's girl I'll have to own up to bein' a Hottentot. Henry, you rascal, I s'picioned you wa'n't makin' them trips to Belfort for the good o' your health, but I never thought o' Jim Hubbell's girl. If you two live as long an' useful an' happy lives as Jim an' Mandy, you'll get what I'm wishin' for you.'

"Well, the turkey was doin' all right, so whilst Maw an' Emily an' Henry pitched in with the dinner, me'n Paw went out to do the noon chores—'cause Sam had gone over home to Thanksgivin'. Paw took along a basket o' apples—like he allers does Thanksgivin' an' Christmas—an' we give a couple apiece to the horses an' cows. Then Sheldon driv up, an' Paw asked him to stay to dinner. He looked at Edith an' she looked at him, an' he said, 'With pleasure.'

"When we come back from puttin' the hoss out Edith an' Emily was thick as molasses an' Hank an' Sheldon had aperns on, ahelpin' with the dinner. I'd only et three apples since breakfast an' I could agot along without so much fuss an' feathers, but finely the table was set an' we set down. But 'stead o' pass'n the food, Paw got up an' looked at Maw. He sez, 'Mary, as for me an' my house, we're going' to offer up thanks. What say, little woman?'

(*Continued on page 1374.*)

Woman and Home

The Deaf Mute.

Written by Fitz Hugh Ludlow after visiting the N. Y. Institution for the Deaf and Dumb.

Scarcely can God's strange restriction
On the lip and on the ear,
By my mind be deemed affliction—
To the sad world coming here.

Where I dwell,—there clamors mortal,
Anger, scorn, detraction, woe.
Thro, the ear's unguarded portal
Throng; in ceaseless overflow.

Here,—God sets His unseen angels
At the gate where earth comes through;
Naught but Heaven's most sweet evangels
Those pure guards let in to you.

Where I dwell,—our thoughts unruly
Have no time to pause and sleep
Till their step beats time more truly
With the march that Love doth keep.

Here—the flying thought, unspoken,
In review floats past the heart.
Where its sting is gently broken
Ere its rapid wing depart.

God hath blessed you in your losses
Silent daughters of His care,
Lifting many bitter crosses
From your shoulders—which we bear.

Tho, no songs your ears are thrilling
Such as move us to delight,
Thoughts unstained by earth are filling
Your soul's chambers day and night.

And to think, to think what glory
Waits you in those wondrous peals,
From the harps of prophets hoary
When God's hand your sense unseals!

The great singers gone before us
Wait to flood your virgin ear
With their unimagined chorus—
As the first sound you shall hear.

The same angel guards that cover
From the world your unjarred sense
Are God's harpers, and they hover,
Waiting with your recompense.

*

The Corn Song.

Heap high the farmer's wintry hoard!
Heap high the golden corn!
No richer gift has Autumn poured
From out her lavish horn!

Let other lands, exulting, glean
The apple from the pine,
The orange from its glossy green,
The cluster from the vine;

We better love the hardy gift
Our rugged vales bestow,
To cheer us when the storm shall drift
Our harvest-fields with snow.

Through vales of grass and meads of flowers,
Our plows their furrows made,
While on the hills the sun and showers
Of changeful April played.

We dropped the seed o'er hill and plain,
Beneath the sun of May,
And frightened from our sprouting grain
The robber crows away.

All through the lone, bright days of June
Its leaves grew green and fair,
And waved in hot mid-Summer's noon
Its soft and yellow hair.

And now, with Autumn's moonlit eves,
Its harvest-time has come,
We pluck away the frosted leaves,
And bear the treasure home.

There, richer than the fabled gift
Apollo showered of old,
Fair hands the broken grain shall sift,
And knead its meal of gold.

Let vapid idlers loll in silk
Around their costly board;
Give us the bowl of samp and milk,
By homespun beauty poured!

Where'er the wide old kitchen hearth
Sends up its smoky curls,
Who will not thank the kindly earth,
And bless our farmer girls!

Then shame on all the proud and vain,
Whose folly laughs to scorn
The blessings of our hardy grain,
Our wealth of golden corn!

But let the good old crop adorn
The hills our fathers trod;
Still let us, for his golden corn,
Send up our thanks to God!

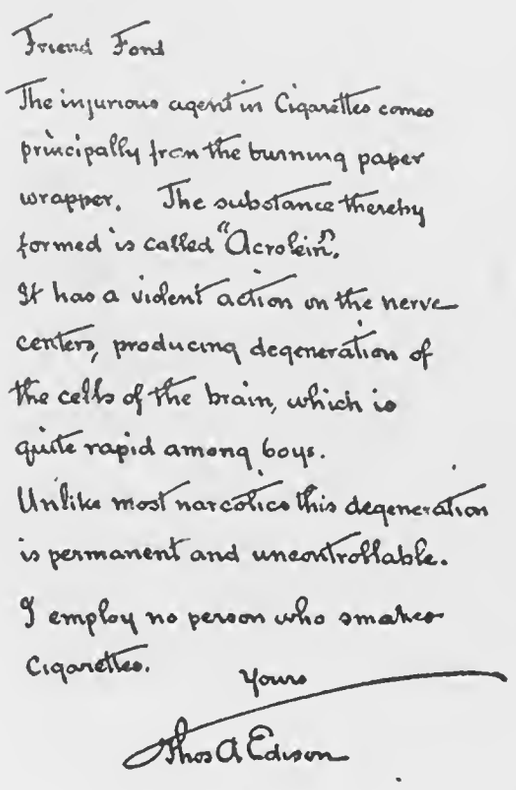
—Whittier.

*

THE University of Wisconsin at Madison is endeavoring to interest the people of that State in community music. A little bulletin, issued by the Extension Division, and costing 10 cents, gives general information about the plan. Good music is a force in civic life. One great source of strength in the wonderful national feeling in Germany is the singing of folk songs. The singing clubs of Denmark helped almost beyond calculation in creating a strong national spirit. Music in the home and in the community or public school has a wonderfully helpful power. It interests young people and brings neighborhoods together for the best purpose. Few things could be finer for the Winter than good neighborhood singing clubs or orchestras. In every community there are natural musicians and good organizers who can get the singers together for practice and training. The Wisconsin University realizes the power for good in such work, and is trying to organize it.

*

IF there is one young person who should feel that he has "much to be thankful for" it is the boy or young man who has conquered the cigarette habit. Next to him should be that boy's mother or sister. The curse of the cigarette is a real thing, and its shadow lies upon many a farm home, where mother and the girls have denied themselves in order that John or James might have an education. The cigarette is putting John and James into a condition of brain and body which will make his education worse than a wasted thing. We would like to have John and James and the rest of the cigarette slaves read this letter from Thomas A. Edison to Henry Ford:



Friend Ford

The injurious agent in Cigarettes comes principally from the burning paper wrapper. The substance thereby formed is called "Acrolein."

It has a violent action on the nerve-centers, producing degeneration of the cells of the brain, which is quite rapid among boys.

Unlike most narcotics this degeneration is permanent and uncontrollable.

I employ no person who smokes Cigarettes.

Yours

Thos A Edison

*

SO far as it is possible to learn from reliable sources manufacturing and trade in Germany goes on much as usual during the war. The factories and farms are in full operation. War prisoners are doing some of the work, but most of the burden has fallen upon the German women. They are literally doing man's work at home and in the factories. Practically all the "observers" who were sent abroad by this country to study European farm conditions, noted that much of the heavy farm work was done by women and girls. Should the war continue for two more years this woman's labor will become *a habit*, and it will have an effect upon the world's industry.

*

THE American Medical Association, in discussing preventive blindness, says:

There are about 300,000 blind people in the United States. It costs about $15,000,000 a year to support them. Probably 75 per cent. of this blindness is due to two causes, namely, sore eyes at birth and neglected eyes during early school life. The first cause can be removed in the simplest manner. All that is necessary is for the doctor or midwife to drop into the eyes of the newly born babe a few drops of a two per cent. solution of nitrate of silver. This will kill the germs that produce the disease which almost fills so many blind asylums.

No one should attempt this except an experienced physician or a trained nurse. Few things are more dangerous than poking substance into the eyes and ears without understanding just what they are expected to do.

*

A DISPATCH from New Jersey tells of a fight between a canary bird and a mouse, in which the former came off victor. The story is that the mouse crawled into the bird's cage as it stood on the table. The mouse was evidently hungry and began to eat up the seeds in the canary bird's dish. The little bird became angry and attacked the mouse, striking it over the head, and in a few seconds had blinded it so that it gave up the fight. After whipping the mouse, the bird flew on its perch and gave a concert of some of its sweetest songs. On general principles it is hard to think of a canary bird, the dear little family pet, in a fight. No one would expect a canary to attack a cat, but given something of its size, and a motive for combating, and it will evidently give a good account of itself.

*

WE think there will be a fair business developed for the future in selling farm canned meat. We have had several articles about this. In many country districts canning the fresh meat is taking the place of salting and smoking to a large extent. The canned beef, pork or chicken is greatly enjoyed and makes an agreeable change from salt pork and ham. In the future there will be a good demand for such meat among city customers. It is one of the articles which can be easily sent by parcel post, and farmers can put such meat on the market at prices which will make it a good bargain. Restaurants and boarding houses will buy such meat for boiling pieces, hash or mince. Many a farm animal now practically given to the butcher can be put into cans and sold at a good profit.

*

THE latest reported "cure" for insanity comes from the osteopaths. They claim that by manipulating certain muscles of the neck the brain is stimulated and put in order so as to help certain forms of depression or mental trouble. The following is offered as conclusive proof of this cure:

Dr. Van Horn Gerdine told of one case of dementia præcox, that of a woman nearly 30, who had been a mental dwarf since she was 14 years old.

"She couldn't get enough blood to her lungs and her brain stopped growing. She couldn't talk and had suffered an entire loss of emotional life. Treatment was given in the region of the neck to restore the nutrition of the blood supply to the brain. Recently her mother visited her, and the patient was so improved that she recognized her mother and embraced her. She talks spontaneously now, and is showing that most human characteristic in women—paying attention to her clothes and running down the dress of other women."

*

EVERYTHING goes by a "score" these days. Babies, cows, fruit and all the rest are judged by a "score card." If this is properly made out and balanced such a "score" is probably as fair as any system of comparison. The latest score card we have seen is one for bread—arranged by the South Dakota Agricultural College. Here it is:

It would be a good plan for housekeepers to score their bread each time after baking, and then attempt to bring up the standard where it is low. A good score card to use is the following:

Flavor	35
Lightness	15
Grain and texture	20
Crust-color, depth texture	10
Crumb-color, moisture	10
Shape and size	10
Total	100

The idea of this private scoring is to see where the bread fails to be perfect and then learn what is most responsible for each quality.

*

THE cause of "votes for women" was helped by the last election. The States of Nevada and Montana voted to give women the ballot, while Ohio, Missouri, Nebraska, North Dakota, and South Dakota voted against the proposition. Generally speaking the liquor interests everywhere lined up against suffrage. This may mean temporary success, but in the long run the cause will be helped if it becomes known that the liquor men oppose it. Unquestionably the feeling against the liquor trade is growing day by day into an undying political hatred which cannot be overcome. In California where women vote, political tickets were cut right and left. Not long since we printed the remarks of a Kansas woman on suffrage. Here is the other side:

You have only asked different farm women most of whom lead a dull existence of household work, if they wanted the vote; and naturally nearly all the answers have been "no," because most of them feel that another straw in the way of work will break the proverbial camel's back, and as long as "John" will do it let him; not knowing that for her the mere fact of the outside interest to be discussed and looked into with perhaps the drive to town to vote would be better than a dose of medicine, even outside of the larger questions involved.

*

OUR women readers write us very freely about their troubles, their hopes for their children and other things which enter their lives. We are glad they do this—glad to have them feel that we will respect their confidences and do our best to help. Now that Winter is coming many household questions come up large and sharp and full of perplexity. One of the hardest things for the farm woman to settle is the money question. The average farmer probably does not quite understand how his wife and daughter feel about this. He provides for the living expenses and relieves the women of financial responsibility. Yet it is hard for him to understand what it means for the women to have even a little money of their very own to spend just as they please. In most cases, such money would be invested to better advantage than he could ever spend it, and there would be a gain in happiness and spirit worth 10 times as much as the money itself. This is why we try to suggest plans for earning some little personal income which the wife may use as her own. It would indeed be a genuine cause for thanksgiving on many a farm if this matter of wife's spending money could be settled.

*

GOV. Glynn of New York believes that the State should attend to the health of all school children—giving free examination of eyes, ears, throat and teeth. There is no question about the wonderful value to the nation which would come from preventing disease. The American Medical Association says that thousands of eyes could be saved every year if eye diseases were detected and cared for in early life:

Dr. Cronin has found that 30 per cent. of school children were two years behind their grades and that 90 per cent. of this is due to eye, ear, nose and throat diseases or defects. He examined 150 defectives in one school and found that 137 of them had ear, nose and throat defects, and that thirteen of them had eye defects. These conditions were relieved and in six months 75 per cent. of the children were re-examined. They were all doing well and were rapidly advancing in school. Their character had also remarkably changed for the better.

We have no doubt of it whatever from our own experience. It is all well enough to say that parents will attend to their own children. They do not. We can point to dozens of intelligent people who have let their children get well started to deafness, throat and eye troubles before they thought of having the little things examined.

*

IT is quite remarkable how men are trying to lay out the future for women. In the *Atlantic Monthly* W. L. George seriously discusses "Uniforms For Women." He shows, or attempts to show, that women spend too much on dressing, and that this leads to envy, waste and immorality. He says the poorer girls and women try to imitate the well-to-do in fashions, and in order to give all women a fair chance to agree he suggests a "fashion" which shall decree this "uniform":

1. For general outdoor wear the coat and skirt is the best, together with a blouse. Lace and insertion should be abandoned, and I feel that the skirt is too long for walking; this month it is certainly too tight to enable a woman to get into an omnibus or railway carriage gracefully. Probable price, complete, $50.

2. For Summer wear, a plain blouse and skirt, not the atrocious blouse ending at the belt, but the beautiful tunic-blouse that falls over the hips. Both blouse and skirt would need to be made of a permanently fixed, plain, and unicolored material. Total cost, $25.

3. If the skirt were shortened, leggings, gaiters, and stockings would have to be standardized; the shoe-buckle, being too costly, would disappear.

4. A fixed type of hat, without feathers or aigrettes, made in straw and trimmed with flowers; produced in scores of thousands, it ought not to cost more than $2.50.

5. A fixed type of evening gown, price, $24 or $32, without any lace or trimmings, sequins, paillettes; without overlays of flimsies of any kind; no voile, no pongee silk, no chiffon, no charmeuse or tulle, no crepe de chine, no muslin, but a stuff of good quality, hanging in straight folds. Jewelry to be banned.

6. The afternoon dress should be completely suppressed; it responds to no need.

7. The total annual cost would be about $150.

Business

The Wife as Bookkeeper.

"OUR farm acount books were bought at the five and 10-cent store, and cost us only a quarter," says Mrs. William Elwell of Otsego County, New York. "These books are guide posts in our home finances. The effort is small and bookkeeping is fascinating. We know where we are at financially, and keeping books has been dollars and cents value. My system may be crude; I am not familiar with practices of the bookkeeper, but my husband and myself are satisfied with our system. It shows us just how we stand with the poultry, the two cows, the household expenses, the receipts from the mail route, and the expenditures in maintaining the little place, feeding the horse, keeping the wagon in shape, and shows us how much we have ahead at the end of the month, and the end of the year. Here is where farmers fail to notice their leaks in the absence of a system of bookkeeping.

"Here is the account of our two cows," Mrs. Elwell said as she turned the pages to the month of March. "This is what the merchant would call a ledger. On the left side of the page I have charged all feed against the cows, and on the right I have credited them with receipts for milk from my customers, for butter sold, and as receipts were light this month, after giving the cows credit for fertilizer, and for milk that we have used this month we have lost 78 cents. My principle of bookkeeping is this: Set down the expenses on the left hand of the middle line of the ledger page, placing the dollars and cents in their proper column, and on the right hand the credits, and I balance at the end of the month, this showed where we stand with the cows. I keep accounts for the hens each month in the same manner, and I know just what they do for us. My husband has a mail route and I keep account of the income, and charge against it the shoeing of the horse, the horse feed and such expenses as might be charged against his work.

"Here is what our cows did last year. We have only a small lot and are compelled to buy our feed. They paid us profit of $73, and we dried one cow too quickly. We had 180 hens and for that year we made $140 profit. These figures may look small to some who figure receipts as profits, and then reach blindly into their purses to meet expenses. We could go further in keeping our household accounts, and charge interest on investment, labor charge, and charge for hired labor, were we operating a farm. We look at it this way: the laboring man has nothing ahead at the end of the year when he pays his house-rent and maintains his family, and at present we are not charging against the cows and poultry the labor charge. Yet improvement in quality of stock repays us for labor.

"We started bookkeeping when first married. My husband and myself discussed our prospects. We figured our annual receipts would be small, as he was at that time working by the day. We began keeping strict account that we might live inside our income, and this has been followed. I am the bookkeeper, and it has kept us from living beyond our income, over-checking our bank account, of spending too recklessly on our poultry and cows. We have learned a lesson which if we carry out later on more land will mean the elimination of the scrub cow and the scrub hen, and the unprofitable crop. Bookkeeping is not hard; get some books and go at it and keep at it. Keep the books handy so every penny received or expended can be readily jotted down in columns so they may be totalled at the end of each month, then keep it up. It will then become a habit, and a habit that pays." W. J.

The Housewives' League and Prices.

THE article in the October number of The Ladies' Home Journal "I will see," by Mrs. Julian Heath, President of The National Housewives' League, should be of interest to farmers. In the main Mrs. Heath's statements are sound, having reason and sense behind them, but her ideas concerning prices for produce seem to me in some instances slightly awry. Mrs. Heath says:

In December, 1912, I read that the apple crop of the United States amounted to more than forty million barrels, one of the largest crops in our history. The quality was excellent. Prices were the lowest in years, and people who never ate apples before could have their fill. But were they having their fill? Not much. The apple was an expensive luxury. Inquiries of farmers brought hundreds of letters saying they would be glad to sell the acreage run of apples at *twenty-five cents a barrel*. Even the most expensive graded apples were offered at one dollar a box.

In the market apples were selling at $2.25 a barrel, and the No. 2 grade for $1.50 and $1.75.

These prices do not seem to me exorbitant. As for apples at 25 cents a barrel, that is ridiculous. We have to pay 30 cents for a barrel in which to put the apples. When we consider the cost of picking, packing and shipping, it is plain to us that the farmer (in the Middle States at least) should never receive less than 50 cents a bushel for good apples. Poor apples are not worth the handling. The Housewives' League should consider this side of the question. I believe, however, they are always willing to give the farmer a fair profit.

In regard to eggs, for example, I venture to assert that eggs should never, even when most plentiful, sell for less than 25 or 30 cents a dozen to allow the producer a fair profit. To lay well, chickens must be fed carefully and lavishly. They have a remarkable capacity for grain and feed is high in price. For several months in the year chickens do not lay at all, but they continue to have excellent appetites. When eggs go up to 40, 50 or 60 cents a dozen, the consumer grows angry and determines to do something. He should remember that the farmer who deals directly with the consumer is only making up his losses when the price of eggs goes up. He who deals with the middleman would better give up producing eggs and sell his feed.

You may think this letter is written entirely from the farmer's point of view. This is far from the truth, for we are in a position to know the producer's as well as the consumer's side. My husband is an office man working for a large corporation. He hates indoor work and loves the country and the open air life. To console himself he raises chickens and plants fruit on every available spot on our acre of land. This year we have had from our place about 30 bushels of apples, 25 bushels of excellent potatoes, bushels of grapes—not counted—rhubarb, plums, and many vegetables from our garden plot. I forgot to mention a wonderful crab apple tree which supplies us and all our neighbors with all the jelly we want. The chickens have been a paying investment because we have a large family and use eggs in abundance. We have been able to supply the family needs and to sell a few eggs besides. It will be seen, therefore, that we can sympathize with both the consumer and the producer. Let me say in conclusion that my husband is a great admirer of THE R. N.-Y. and of the Hope Farm man, whose page he always reads first.

A PUBLIC "JOY RIDE" VEHICLE IN PORTUGAL.

Pin Money Puzzles.

FRUGAL LIVING.—How can we live comfortably and respectably without spending such enormous sums of money? That is the query heard in almost every household. The question is not difficult to answer. It is nothing more nor less than realizing the difference between our wants and our needs. Don't spend money for trifles. Save your money for big things and do without the little ones. There are numberless housewives who have not yet learned that the most exciting game in life is in getting two hundred cents worth of goods for one little, lone dollar. That is what we call "right buying." It doubles the capacity of your income. You feel as though you were a member of the board of trade. When pineapples are a glut on the market then is your time to buy. If there is a cut-price sale in dry goods lay in a supply of staples—not trash. Make one dollar do the work of two; that's the secret. I have the greatest admiration for the girl who can keep a tight rein on her pocketbook, yet have good food and proper clothing. The word "capable" seems to just stick out all over her. Self-denial is one of her virtues. Thrift is founded on self-denial.

THE GROCER'S BILL.—Some years ago, when living was "easy," we were at a family dinner when the subject of "grocery bills" came up. One of the cousins told how his wife was able to set a good table for four and still keep the expenses within one hundred dollars. When it came the hostess's turn to "confess" she put her hand over her eyes and said: "I'm ashamed to tell how much our grocery bill is for a year." We gave her to understand that there was to be no backsliding. "Well," she said, "to be exact, it was $29.63 for the last year." We fairly shrieked at her. "Tell us how you did it." Then she gave us an outline of her plans. Her husband supplied the flour and meat, and she furnished the groceries, bought all the clothing for herself and two little boys with the butter and egg money. She knew the value of a good garden, and they never had to buy a vegetable of any sort. She took advantage of right buying. Early in the Spring when prices were low and the hens were busy she laid in a year's supply of sugar. Then in January she took advantage of the cut prices in muslins and saved a few dollars. They were renters on a farm, and she saw it was up to her to make a start to save for a home. She worked harder than ever, cutting out all her Summer reading but the farm paper, so she could have more time to devote to her poultry. Then she sold milk, butter, lard, berries and finally some vegetables. After a few months she had her business as well organized as any merchant, and it was no more trouble for her to put three or four dollars in the bank every week than it was to wash the dishes. In seven years she had saved one thousand dollars. Now at the end of six years more she has saved another thousand. This with her husband's inheritance will pay for their home. They had good food and good clothing and the boys had a common school education, and they are much happier and more contented than if they had spent that two thousand on a myriad little things and done without a home.

TEACHING SELF-DENIAL.—Not long ago I saw a man and his little son come into a grocery store. Both were dressed with the best possible taste. The little son handed the grocer a nickel for some candy.

"What," said the father. "Spend *all* your money for candy? Then you will have none left. Get only three sticks of candy and you will have two cents to keep in your pocket." The arrangement delighted the boy, for by it he had both money and candy. He also had a lesson in self-denial that would stay with him through life. Children are allowed to spend money too thoughtlessly. Teach a child to ponder over in his mind whether he needs a thing or if he only wants it.

A GIRL'S SAVINGS.—I know several girls who are school teachers who make it a rule to lay away one-half of their wages. Even the small sum of one hundred and fifty dollars a year saved and put in the bank will give a girl a feeling of security, as well as bright visions for the future. One of these girls was married a few years ago, and she had $600 laid up from her school money. Isn't that interesting? Besides, she had dressed well, bought a good piano and several nice pieces of furniture, and had as good times as any girl. Now she has her home nicely furnished and she and her husband manage to save one-third of his wages every month. Her baby girl, a year old, is clad in rompers made from the lower part of the father's percale shirts. This is the kind of thrift that counts. It buys the coal, it pays for some little luxury for the Sunday dinner, and it will in time pay off the mortgage on the home.

MAKING AND SAVING.—Doubtless many of you are saying, "that isn't telling us *how* to make money," but it is. "A penny saved is a penny earned." I believe there is something that each one of us can do—something peculiarly our own—at which we can be successful in earning our own independent spending money. If we will only study the situation and find out what is wanted, what everybody is clamoring for, then that is the thing to do, and do it *well*. Now that old-fashioned quilts are in style again many women are making quite an addition to their income by taking orders and making these beautiful old-fashioned bed coverings. Personally, I love this work and have made three of these of the sewed-on kind for one customer. For an average block 25 cents is charged; this includes setting the quilt together and putting on a border. Then if one can quilt this brings the price of one quilt up close to $15. Whatever you engage in you must work systematically. Have a plan and stick to it. Every worker has need to watch up the fractional currency of time just as much as a school teacher does. Work on schedule time and don't let one thing crowd out another. You can't make housekeeping easy—or if you could what would it amount to? The easy things are not given a reward of merit for their doing.

IDA M. JACKSON.

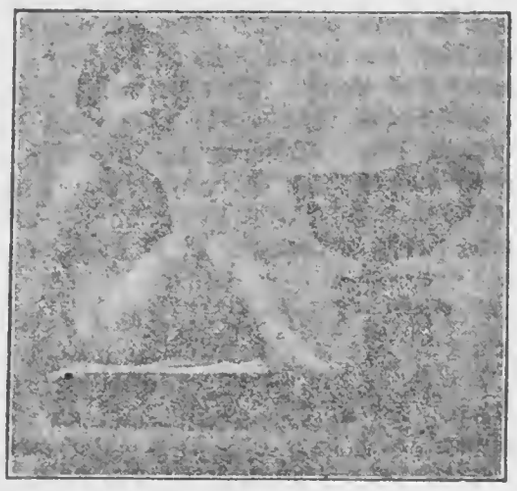
The Netherlands will have five acres at the Panama Exposition for the display of bulbs and rare garden flowers. There is to be a prize of $1,000 for the best variety of rose originated and exhibited at the exposition. Japan will have the most extensive display she has ever presented at a universal exhibition. She will send 150 tons of rare Japanese trees and shrubs for transplanting. One of the noted features at the exposition will be a beautiful statue typifying the pioneer women of California, by the famous sculptor Charles Grafly. The idea was originated by the Woman's Board of the Exposition, but the execution of the plan was given to the Pioneer Mother Monument Association who raised the $25,000 necessary for the project. The school children of California were among the first to contribute to the fund, sending in pennies or nickels, the latter being the largest amount any one child could give.

"Better Babies Contest"

Judging Young Human Stock

By Mrs. Cora Hamilton

THE "BETTER BABIES CONTESTS" started in Binghamton in 1913. It is held under the auspices of the Rest Room Club, Miss Viola Lee, the president, having charge of the Contests. Six days in the week Miss Lee is to be found at the



WEIGHING THE BABY.

Rest Room busily engaged in helping babies to become "better babies" and extending a smiling welcome to all comers. For remember this, the "Better Babies Contest" is not a matter of a few days, but is steady, constant care for all the little ones entered in the contests. Already some are enrolled for another year; parents are waking up to the great advantages secured for the babies by entering them months ahead of the contests.

ENTERING THE BABY.—When you take your baby to be entered its name and age are written down on a card which will serve for a full year's record of baby's growth. Its exact height is recorded, then the little one is undressed and given a thorough examination by Miss Lee, who often finds some physical defect, which otherwise might have gone unsuspected for years until it caused serious trouble, but which, taken in time, is soon remedied, thus giving baby a much better chance when the contest comes; to say nothing of the great gain to it in having any trouble righted before it gains much hold on the child. Miss Lee suggests many things to the mothers that help them wonderfully in the care of their little ones, both as to proper care and feeding, and also how best to correct any trouble discovered by the examination. After the examination, baby is carefully weighed and its exact weight recorded. Once a month for a year it is carefully, measured, weighed and examined, then at the end of a year Miss Lee has a monthly record of baby's progress, and it is wonderful what gain some of the babies have made under her wise care. Just think, all this care and advice free for a year for only the one dollar membership fee, and then at the "Better Babies Contest" which was held in the Broome County Court House Sept. 15-16, each child was examined by four specialists.

SCORING CONTESTANTS.—On first entering the court room, the mother filled out the baby's score card, giving name, age in months, whether bottle or breast fed (or both), how long it was so fed, what its principle food is at the present time, whether it sleeps in the open air or with open windows and how many, sleeps alone or with some one, and who that some one is, its nationality and also its parents' ages and whether it is the first, second, third or fourth child, or more. After the score card is filled out so far, it is given to the mother and she is told to go into Room 1. Here is the first physician and his helper, who takes the score card and fills in the blanks as the doctor tells her. He talks to baby and gets it to do certain little acts, such as looking out of the window when told, recognizing a ball and throwing it, naming different objects on being shown their pictures—such as a horse, cow, cat, dog, etc.—or if it is a very young baby just trying to see if it will grasp at a bright object or turn its head on hearing a sudden sound, recognizing its mother; in fact just giving certain tests according to its age as to its mental development, six months being the youngest age at which they are admitted and five years the oldest.

THE PHYSICAL TEST.—After babies were through in Room 1, they were taken out and undressed and then snugly wrapped up in a kimono, bathrobe or blanket, to await their turn in Room 2. Here Dr Hall was waiting, with two nurses (these nurses are employed by the city schools and spend their whole time looking after the welfare of Binghamton school children under directions of the school physician). One of the nurses steps forward and takes baby and stands him on a table in front of the doctor, if old enough to stand alone, if too young it is laid on a blanket and then its exact height is measured (using the measuring board, same as Miss Lee uses). As the doctor called out the measurements, Nurse No. 2 recorded them on the score card, the length of the arm and leg measured, the distance around the head, chest and abdomen was taken and the thickness of the chest measured. Then

MEASURING THE YOUNG STOCK.

after being carefully weighed baby was wrapped up and given back to mother.

THE SPECIALISTS NEXT.—Next came Room 3, where specialists were waiting to examine the eyes, ears, nose, throat, teeth, etc. Some cases of enlarged tonsils, adenoids, defective teeth and enlarged glands were discovered where the parents were entirely unaware that the child had any such trouble. The specialists gave the parents much good advice on what to do for the child in such a case. Other physicians examined the babies' bodies to make sure that all was right, even their tiny fingers and toes coming in for a share of attention. Their hair and scalp was examined, and each and every point was noted on the score card; also their behavior during the examination, extra marks being given for good nature, while bad temper was the cause of more than one black mark. So mothers, you see that a sunny disposition helps out in many ways; while some babies were laughing and having a fine time, others were yelling themselves black in the face. One mother had two little ones, and as she held the baby the examining physician took the larger child in his lap. Then the fun commenced—of all the kicking, and wiggling and screaming you ever saw! He was one of those fat, jolly doctors with a smile that hardly ever comes off, but it came very near it then. First the little lady was doubled up as if in terrible agony, next minute she would throw herself back and stiffen out, and then kick and yell some more. I rather guess the onlookers enjoyed it more than the doctor by the way the perspiration ran down his face before he got through. Other babies would laugh and play and look at the crying ones to see what was the trouble. Sometimes a number would get crying at once, and as each one cried on a different key, we had lots of music. But the doctors and nurses were so kind and gentle with the little ones that the tears soon disappeared, to be replaced by smiles. Miss Lee was everywhere, first in one room and then in another, to see that everything was as it should be.

THE SCORE CARDS.—After each physician finished his part of the examination he signed his name to the score card under the list of examinations and their results, that his attendant had marked on the cards. After leaving Room 3, babies were dressed, and then on leaving the court room each mother handed the baby's score card to the young lady outside the door. The following week was a busy one for Miss Lee and her helpers, as each score card had to be added up, and the scoring done according to the rules furnished by the Woman's Home Companion. Where last year the highest score of any baby was 95½%, this year a number scored 96, 97 and 98%, and one three-year-old boy, G. Desmond Harter, scored 100% perfect, receiving the bronze medal given by the Woman's Home Companion to the highest scoring boy; also a handsome silver cup given by a local jeweler for highest score, and also first prize in Class 3—a handsome little willow rocker. The girl scoring highest was Mary Crocker, 97½%, seven months old, who also received a bronze medal and silver cup from the same givers, as well as first prize in Class 6—a handsome dress. There were three prizes in each class, besides the extra prizes for the highest scoring boy and girl. There were five classes for boys and five for girls; six months to 12 months, 12 months to 24 months, 24 months to 36 months, 36 months to 48 months, and 48 months to 60 months. The Woman's Home Companion gave each child a pretty certificate for framing, showing they had been entered in the contest and giving the percentage they scored on examination. The certificates are signed by Gertrude B. Lane, editor of the Woman's Home Companion.

THE PRIZE WINNERS.—These certificates and the score cards were given to the mothers September 25, when there was another gathering of the mothers and babies and their friends, this time in the chapel of the First Presbyterian Church, where Dr. Lawrence, the pastor, gave a short address to the mothers and congratulated them on the big advancement the babies had averaged over the previous year. There were 150 babies in the contest, and nearly all of them were present with their mothers and friends. After Dr. Lawrence's address, Miss Lee came forward and was given a hearty

THIS BABY SCORED 95.5.

welcome, the hand-clapping and welcomes showing how near she has grown to the hearts of mothers and babies in the last two years. She spoke for a few minutes, and then Mr. Michaelbach, chairman of the Board of Health, gave an address, and then helped Miss Lee to announce the prize winners. As each winner's name was called the mother carried the baby up front, where it received the prize, and then they were seated in chairs facing the audience. The first prize-winner, little Mary Crocker, seven months old and girl champion in the contest, Mr. Michaelbach held up so everyone could see her, and then before returning her to her mother, gave her a hearty kiss. There were many nice prizes—high chairs, watches, coaster carts, Indian suits, dresses, caps, orders on the photographers for photographs, beautiful dolls, rings, silver spoons, and many others besides the special prizes for the champions, which were bronze medals and silver cups in addition to the first prize in this class. When the 100% perfect baby was stood up on the pulpit so everyone could see him, the audience cheered him till the little fellow began to be frightened, so he was given his prizes and trotted back to his mother.

VALUE OF THE CONTEST.—Many babies were entered which the parents knew were ineligible for the prizes, but they wished them to have the advantages of the examinating specialists' advice, and felt very much satisfied with the results of the examination, as the doctors gave them much good advice which if carefully followed out will put Binghamton in the lead in "Better Babies Contests" next year. Only a few of the children were found to have defects which could not be remedied with proper care while young. During the week of the contest (which by the way was called "Baby Week" in Binghamton) an exhibit was held in a prominent store, showing the proper fitting for the nursery, and a trained nurse was in charge who gave demonstrations of the proper way to bathe and dress the babies.

MRS. LORA HAMILTON.

"Rich Milk."

THE "office boy" of the Holstein-Friesian Register is guilty of the following. If our Jersey or Guernsey poet desires to come back in equal space—it awaits him.

Our Mary had a Holstein cow.
That gave no end of milk;
Does anybody wonder then
That Mary's gowns were silk.

Her dear friends tossed their heads and laughed
(Nice pussies with sharp claws)
They said the milk was horrid thin,
And Mary thick with flaws.

But Mary kept on selling milk,
Her cow soon had a calf;
The calf exchanged for diamonds
Left Mary with the laugh.

The pussies soon drew in their claws;
Each bought a Holstein cow;
They all engaged in selling milk;
All wear silk dresses now.

—The Office Boy.

Things to Think About.

TO clean the dust from wallpaper, buy a roll of cheap cotton batting and go over the paper the first time very gently and a second time with a little pressure.

For living rooms where the paper has become more or less smoked a delicate colored paper can be cleaned by rubbing the paper with the soft part of fresh bread (white).

Very few men today are satisfied for long with ineffective, animated dolls—or animated clothes-horses either. They want their wives to be awake, to get together, to do things, as in their own business they are compelled to do. (From "The Business of Being a Bride" in Good Housekeeping).

"The only saving that really counts today is the saving that comes from wise spending—not bargain-hunting or striving to pay less for things than they are worth, but getting the right things, at right prices and made under right conditions, so that everyone connected with the transaction, from the men and girls at the machine to the children who wear the clothes and eat the food, gets the fullest return from the outlay.....A penny saved instead of a penny properly spent is a penny wasted. Why not remember the parable of the talents, and learn wisdom from it?"

How to Make Tatting.

CAN you give me any information in your paper regarding how to do tatting? C. S.
Tafton, Penn.

Tatting is made with a shuttle which consists of two slender pieces of wood or bone or rubber in shape like diagram. These two pieces are put together, one

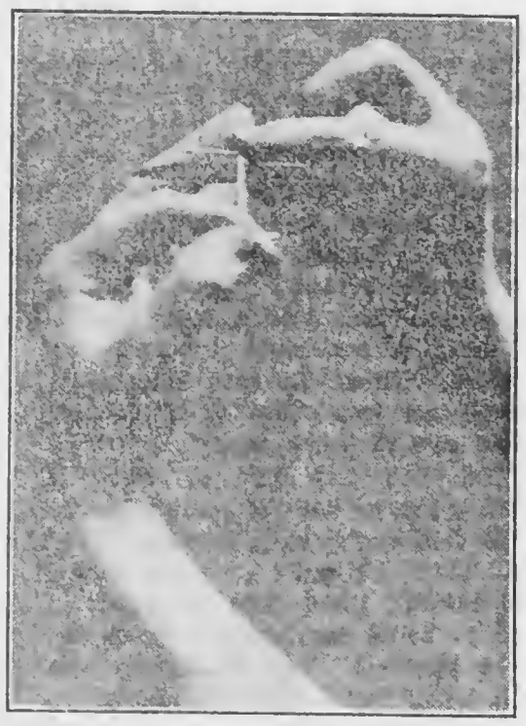
TATTING SHUTTLE.

on each side of a slim straight piece in which there is a hole. To wind, tie the thread through this hole, then begin to wind around that straight piece until the shuttle is full. Then break off thread from spool, leaving an end about 18 inches or two feet long. To start the stitch, hold the shuttle between thumb and first finger of right hand, with the length of shuttle parallel to fingers. Take the end of thread between thumb and first finger of left hand, the end of thread pointing toward one and bring the thread in a loop loosely around all the fingers, holding the two threads side by side, without tying a knot. There are two different

TAKING FIRST STITCH.

stitches in a purl. The first is taken thus: with the thread on left hand as described, and the shuttle in the right, the thread from the shuttle coming on the side next the fingers, take the thread from shuttle over the middle and third finger of right hand, holding it up, next slide shuttle under the thread of loop over left hand, in space between thumb and first finger. Slide the shuttle entirely *under* and then *over* the thread of loop, and bring it toward oneself with a quick pull, which will make a loop over the right hand thread of the two lying side by side on top of the first finger of left hand.

Next, holding the shuttle in the same position but holding the thread *down*,



TAKING SECOND STITCH.

caught over the third finger of right hand, slide the shuttle entirely *over* and then *under* the thread on the left hand and draw toward one with a quick pull. This will make another loop over the right hand thread lying on the finger. This completes one purl. One sees that the different stitches look slightly different.

To make a picot, leave a loop of thread sticking up about one-eighth of an inch between two stitches made by the left hand thread, of course, not by the right hand one.

The simplest form of tatting is made like this. (No. 1). Make four purls, picot; four purls, picot; four purls, picot; four purls; then pull up the thread tight and make a circle, like a thread buttonholed over very tightly. In making the next circle, bring thread up over left hand and start as described for starting the first stitch, holding thread up. Leave about a quarter or three-eighths of an inch of thread between first circle and first stitch of second circle. Now make four purls, fasten to third picot of first circle in this way; with a crochet hook or large pin, draw the thread lying over the first finger of the left hand up through the picot from underneath, then pass the shuttle through it and draw the thread down again. Then make four purls, picot; four purls, picot; four purls. Draw up circle as described before. Repeat this second circle to make any desired length of tatting.

A beginner is very apt to try to make the stitches over the wrong thread, and in that case the circles refuse to draw up. The thread over the left hand is the one to use in making the stitches, the one lying at the left as the two threads lie together when first looped over the hand. In trying to learn, it is a good idea to use a coarse thread, or even yarn, for one can see so much better what she is trying to do, and if possible get some one who already knows how to show the stitches, for one showing will help so much. Learning to make tatting is like learning to ride a bicycle; before mastering the art, every way excepting the right way is easy; and after one has learned it is easier to do it rightly than wrongly.

To make two thread tatting, one winds the shuttle full but does not break the thread from spool, as that thread is also needed. Make a circle in the ordinary way, then hold thread from spool close to the circle with thumb and first finger of left hand and catch the loose end over little finger, winding it around finger so it will stay firm. Use this thread on left hand to make stitches over thread from shuttle, in place of the ordinary loop over left hand, as in one-thread tatting. Using the thread in this manner, make five purls, picot, five purls; draw up stitches as tight as possible. Now make another circle, having the first stitch as close to the last stitch of the loop as possible, and fastening into the third picot of previous circle, as in one-thread tatting. Make another loop with the thread, then another circle as described, and keep on for any desired length of tatting, ending with a circle.

There is on the market a shuttle having a little peak at one end which can be used in place of a crochet hook, and it is a decided improvement. It can probably be found in any large store dealing in such things. Booklets giving patterns are sold by dealers in materials for fancy work. H. P. K.

REMOVING NITRATE OF SILVER STAINS.—For the benefit of any who stain their fingers while dyeing a coat according to the directions of E. A. C., as given on page 1291, or who in handling the solid stick of "lunar caustic" make unsightly black marks upon the hands, let me say that a solution of potassium cyanide will remove the stains without waiting for them to wear off. This latter chemical is a most virulent poison, however, and only the very small quantity of the solution that is needed should be made up at one time, and any that is left over should be at once thrown out where it can do no harm. X. Y. Z.

BOY'S GETTING UP.—What time shall the boy get up for breakfast? For answer the Wisconsin Anti-tuberculosis Association states: "Among other facts this exhibit portrays the model boy getting up at six o'clock in the morning. After taking a little exercise and performing certain necessary ablutions, the youngster eats breakfast. He then walks slowly to school. He is expected to play during the recess hour. When school is out, he runs home for the noon meal. It is entirely true that the average boy walks slowly to school and runs home to dinner.

RYE BREAD.—To one quart of warm water stir in as much wheat flour as will make a smooth batter: stir into it one cake Fleischman's compound yeast dissolved in a cup of lukewarm water, and set it in a warm place to rise; this is called setting a sponge; mix it in some vessel which will hold twice the quantity; in the morning, put three pounds and a half of rye flour into a bowl or tray, make a hollow in the center, pour in the sponge, add a teaspoonful of salt, and make the whole into a smooth dough, with as much warm water as may be necessary; knead it well, cover it, and let it set in a warm place for three hours; then knead it again, and make it into two or three loaves; bake in a quick oven one hour, if made in two loaves; if made in three loaves, somewhat less time will be required for baking. K.

:: Good Words ::

Of course I want the paper, for reasons that would take too long to state here, and would be only a repetition of what you have so often heard. But one of them is the feeling that you run a paper in which the performances of the average man are chronicled, and the ones that one can reasonably expect to duplicate if he is careful and on the job. I consider that to print the true story of the exceptionally expert man, in such a way as to give the impression, that any man can do as well, is the most insidious kind of lying. BLAINE EWING.
West Virginia.

You publish a paper that is so helpful and of value to all that one enjoys doing anything to help others benefit from it. Also you have a large credit balance here for the past favors you have done me and I am only too glad of an opportunity to score something on my side. If there is anything further I can do for you please advise me. J. S. LANGFORD.
New York.

"CLOSER THAN A BROTHER."—The place on which I was brought up and at that time raised enough to winter a dozen head of all kinds of cattle and nearly 50 hens. Today it keeps one old cat, nearly old enough to vote, the grass is sold on the ground for $25. *Selling papers is very much like a fellow when he gets acquainted with a girl. There is no one like her. Experience teaches me that when people become acquainted with one paper, it is a hard task to switch them to something else.* B. S.
Westchester Co., N. Y.

R. N.-Y.—It would be a fine thing for humanity if all men were as constant.

A BUSINESS MAN.—We don't want any premium for working for THE R. N.-Y., for every time we can get a subscriber we feel we are helping ourselves. Every farmer who reads THE R. N.-Y. becomes educated, and our interest lies in that way. We are boosters for our own selfish interests. A. H. G. H.
Niagara Falls, N. Y.

I don't think any man would or could expect more for his $1 per year than you are giving in the line of your paper. H. H.

THREE GENERATIONS.—While I am not engaged at present in farming I am very much interested in the grand old RURAL NEW-YORKER which I have taken for 30 years; my father was a subscriber before I was, and I have a son who is also taking it now. With best wishes for your continued success. F. L. M.
New York.

GOOD "DOPE" FOR A DRUMMER.—I am a traveling salesman and it doesn't seem possible that a farm paper would be of much interest to me. But you have mighty good "dope," and THE R. N.-Y. helps me spend several hours while I am going from place to place. J. J. M.

Charming Fur Set, only $3.49

Made of French Coney—a soft luxurious black fur, which is very desirable. The price of the set we illustrate here is quite unusual for the quality offered. This set has a generous shawl collar, trimmed at each end with two fur tails, fastens high at the neck. Measures about 60 inches from end to end. Warmly padded and lined with fine quality guaranteed satin to match. The stylish muff has head and brush tail ornamentation. It is made over a warm padding, lined with fine quality guaranteed satin and measures about 13x15 inches. Equipped with wrist cord. No. 9E493 French Coney Fur Set, Prepaid Price, per set . . **$3.49**

Turn to page 78 of "Your Bargain Book" for other astounding bargains in fur sets. "According to Jimmy"

(Continued from page 1369)

"'Amen!' sez Maw.

"Then Paw thought o' sumpi'n else, an' he sent me to get Edith's letter, he'd forgot to give her. Paw told her to read it. The first thing come out was a check for eighty dollars an' then a letter 'at said they'd heard she'd lost her position through no fault of her own. After 'vestigatin' they found she'd also been beat out of her pay. Said they couldn't afford to let anything like that happen, so they'd made the firm settle. Said they was glad to do her the little service, as she was one of the brightest students they'd turned out, an' wanted to know if they could get her another position.

"Yessum, they all forgot about dinner but me. I begun to help myself, but Paw sez, 'Just a minute, young man. Edith, you can make up your mind about that position later.'

"'She's made up her mind already,' sez Sheldon. 'I offered her a position as the better half of my family 15 minutes ago an' she accepted. The quicker she enters upon her duties the better I'll like it.'

"'Hooray!' sez Paw. 'Now we'll offer Thanksgivin' to Almighty God from full hearts. My blessin's are many more than I deserve, after the way I have acted this day.'

"Then he bowed his head an' begun. Say, Mis' Holcomb! I wish't you could a heard him. I bet he beat the preacher a mile!

"*Say!* I forgot all about them traps."

:: "Farm Stories" ::

"TWISTY-TOE."

A Thanksgiving Story of the North Country.

By The Brown Owl.

"COME boys, get up! This is the third time I've called you, and it's going to be the last," called Bess, from the foot of the stairs. "The pancakes are almost done and I just *won't* save a single one for you if you're late."

Dick stretched lazily in his warm blankets, as he opened one eye at a time. The window showed a patch of pale gray dawn that announced the approach of a cold stormy November day in the North Country.

The boys' room, over the kitchen, was warm and dimly lighted from the holes in the register around the stove pipe. It was a bit smoky also, but the fragrant odor of hot buckwheat cakes, steaming coffee, and potatoes being warmed up in ham fat, was far from being disagreeable to the always hungry boys. Dick put a foot against the back of his drowsy brother and sent him rolling to the floor, bedclothes and all.

"Hurry up, Will," he said, "let's get down quick, breakfast's ready and Burt 'll just sure fill up on the cakes."

With much pushing and scuffling the boys finally got into their clothes and stumbling noisily downstairs they made a dash across the kitchen for the wash basin.

"What are you boys trying to do, tear the house down?" called father from the dining room.

"No sir, Dick is trying to get to the washdish first," meekly answered Will.

"Come, hurry boys," mother gently urged, as she came out for the coffee pot. "We can't wait for you."

Presently the two boys, their faces not any too dry, their hair combed carefully in front, slid, still giggling, into their places at the table. Burt, a ruddy-faced boy 14, was already at the pancakes, and Bess, a tall pretty girl of 16 was busily helping serve breakfast. Burt and Bess drove to town to high school, while the two boys of 10 and 12 were still going to the district school. Their home, not many miles from the Canadian border, was a plain but comfortable old farmhouse, like many of the neighboring places. It was surrounded by level, fertile meadow lands, rocky rail-fenced pastures, and patches of woodland. When the breakfast was nearly over Mother said:

"I wish you would kill the chickens for me before you start chores, father. There was no time to dress them yesterday, but if I can get at them, at once there will be time for them to get cold before they have to go into the oven."

"Thanksgiving!" The heart of Dick sank with a thump. He hadn't thought of it since he got up, but it was heavy on his mind when he went to bed. Bess and mother were discussing the dinner, father and Burt were talking about fixing the box stall for the colt, so no one noticed that Dick's pancakes were not receiving their usual attention.

Thanksgiving, the day he had been dreading, had come. "Twisty-toe" would have to be killed. There are those who can understand the affection between a boy and a pet rooster. This Rhode Island Red had been singled out by Dick when he found the downy little chick with one toe curled around over another, and from that day Twisty-toe was Dick's chicken, to be fed, petted, and tended to until he became a regular nuisance.

"FARM PRODUCTS!" LEADING UP TO PUMPKIN PIE.

Twisty-toe was always hungry after the manner of his kind, and he had been petted so much by Dick, that if he could not find his friend in the back-yard he would go around and stand near the screen door on the porch and wait. Many a time during the past Summer, Bess, broom in hand, had furiously chased him around into the back-yard. It never did any good, he was soon back.

During the Fall, when chickens were to be either sold or dressed for family use, Dick had managed to have Twisty-toe passed by, usually by saying that he would be a fine big chap for Thanksgiving. Now, he was quite sure nothing could save his pet. After breakfast, mother, going to the woodshed after the scalding pan, encountered Dick, as he rushed in from out of doors.

"Why, Dick, what is it, child," she said, as he saw the look of real terror on his face.

"Oh, mother, please come quick and fix things, so they won't take Twisty-toe!" he cried. "Please mother, I just can't have him killed!" There were tears in his big brown eyes.

Mother set down her pan and went out to where father and Burt were waiting, near the chicken yard, for Dick. Dick trotted comfortably on ahead of mother, with absolute confidence in her being able to fix things satisfactorily.

"Here, Dick," called father, "catch that big fellow there. He is nearly as large as a young turkey."

"Is there another one that same size?" asked mother.

"He's the biggest there is," said Burt.

"Well," said mother, "one would hardly be enough for us today. What if you kill three of the others that are nearer of a size? They are all fat."

Dick shot mother a grateful grin as he flew furiously about after the others. As he passed Twisty-toe he gave the big red back a friendly slap that caused his pet to hop into a corner

It was nearly noon when father and Burt came in from the barn. The day was cold and windy, and the steamy fragrance of the warm kitchen made both father and son sigh with satisfaction. A subdued sizzle from the oven told them that the chickens were baking, and the top of the stove seemed to be covered with kettles and saucepans, each sending forth clouds of steam.

A shout from the window where Dick and Will were playing checkers and munching apples brought Burt to their side.

"Oh just see the side hitch I've got on him now," sang out Dick. "Either way he jumps I'll take three to the king row." Dick was noted for his "side hitches."

Mother and Bess stopped by the players long enough to look and laugh. Burt reached for the remaining apple in the six-quart pan near by, whereupon a delighted shout went up from Will. "The one that takes the last apple has got to go down and fill up the pan." That was one of their own rules, so Burt good-naturedly took up the pan and started down cellar.

"What kind do you want, kids?" he called from the top of the stairs. "Lincoln's Likings for me," called Will. "Flat Dutch for me," said Dick, and he added, "Say, Burt, just look and see if you can't find one from the yellow apple tree and a couple of water-cored Bellflowers."

"Well now see here," said Burt. "What if you come down and do your own hunting."

"Can't do it," answered Dick, "I've got Will headed straight for the double corners and I've got to beat him twice more before dinner."

One o'clock came and mother said: "Come now boys, come father, dinner is ready."

The boys lost no time getting to the table, and mother and Bess, their faces hot but smiling, started to serve up the feast. The chickens were beautifully brown and Dick could see that there was going to be plenty of dressing. The baked potatoes burst at the first touch of the knife. The Hubbard squash made a great mound of yellow. The dish of boiled onions had a large piece of butter, slowly melting away on top. In fact the table seemed full of just the very things mother knew they liked best.

Long before pudding time the boys began to shift uneasily in their chairs and to wish that they had "saved a little more room." But when at last, Bess, having cleared some of the things away, brought in the big pudding and set it in front of mother, Dick spoke the feeling of the family when he said: "Um—the very smell of that pudding, mother, makes me feel's if I could eat it all myself."

Dick scraped the last bit of pudding sauce from his dish, looked at it thoughtfully a moment and then put it down. "I just can't hold it," he said.

"Why don't you go out and run around the house a few times?" said father laughing; "then perhaps you would have room for it."

"I think I will," said Dick, and getting carefully to his feet he found his cap and went out into the yard. He wandered around to the front of the house, and seeing a boy coming up the road he stopped nearby until he should come along. It was Willie Longgo, with hands stuffed in his pockets, and trying to produce a whistle that would sound cheerful at least.

"Where you goin'?" said Dick.

"Oh, up the road a little ways," said Willie. "I thought maybe my uncle might come down today."

"Had yer dinner?" asked Dick.

"Naw, not yet," said the boy. "Pa is goin' over to Jim Collins' after a while an' see if he kin git some pertaters. Pa's goin' to work fer Jim next week, I guess."

The wind was cold, and neither boy cared to stand longer, so Willie moved off up the road and Dick rushed into the house where the rest of the family were still sitting around the dining table.

"Oh, mother," he burst out, Willie Longgo just went by and he hasn't had any dinner."

"I don't doubt it one bit," said mother. "Joe Longgo worked yesterday and the day before that, for Marlin," said father; "but I saw him trying to get home from the village last night, and he didn't look as though he cared whether there was a thing to eat or not for today's dinner."

Exclamations of anger and disgust came from Burt and Bess, and mother sat sad and thoughtful, looking out of the window.

"I don't know what we are going to do with those people," she said finally. "There is plenty of work for both Joe and his wife if they would only do it. There is no need of their living so. The neighbors just clothe those children the year around, and I've said over and over that I would never send any more food over there but—those children."

The eyes of all were on mother's face. Unconsciously she was their leader in everything. Father and children alike looked to her for guidance. She was a tall faded-looking woman, but her face was full of a quiet strength that made her a power for good not only in her own family circle, but in the whole neighborhood as well.

"We'll just have to send them some dinner," she said at last, "and we'll have to send enough so that those children will be sure to get some of it."

Everyone was at work at once helping to have things ready when Willie should come back. During the confusion Dick slipped quietly out of the house, and mother, going into the woodshed for a basket, found him thoughtfully kicking a stick of wood near the woodshed. He ran to climb up for the basket mother wanted, and as he handed it to her he said, almost in a whisper, because he did not dare trust his voice:

"Say, mother, can I give 'em Twisty-toe?"

His face was tear stained and grimy, but mother stooped and kissed it tenderly. "Certainly Dick if you want to," she said gently.

The basket containing a whole roasted chicken, a loaf of bread, over half of the great pudding and a jar of cranberry sauce was waiting for Willie when he straggled aimlessly down the road a little later. Near the foot of the hill, and out of sight of the house, as Willie was taking a delighted peep into the basket, he came upon Dick with a great Rhode Island Red chicken under his arm.

"Hey Willie," he said sternly, "does your father know how to kill a chicken quick, so's it won't hurt?"

"Um—you jest bet he does. He's killed sights of 'em an' knows jest how."

"Well if you're sure, you can have this one. Here, I'll put him under your arm. You needn't pinch him so tight. He's used to being carried, but he don't like to be pinched. You remember what I said, now," said Dick warningly.

"You bet yer life," said Willie as he staggered off with his load.

When Dick returned to the dear familiar kitchen his heart was full of a Thanksgiving that he did not more than half understand. Bess and mother were clearing up the dinner, Burt and father were reading and Will was waiting near the window with the checkerboard all set.

"Come on Dick," he said. "We'll have time for four or five games before we have to cut our beets and turnips for chore time.

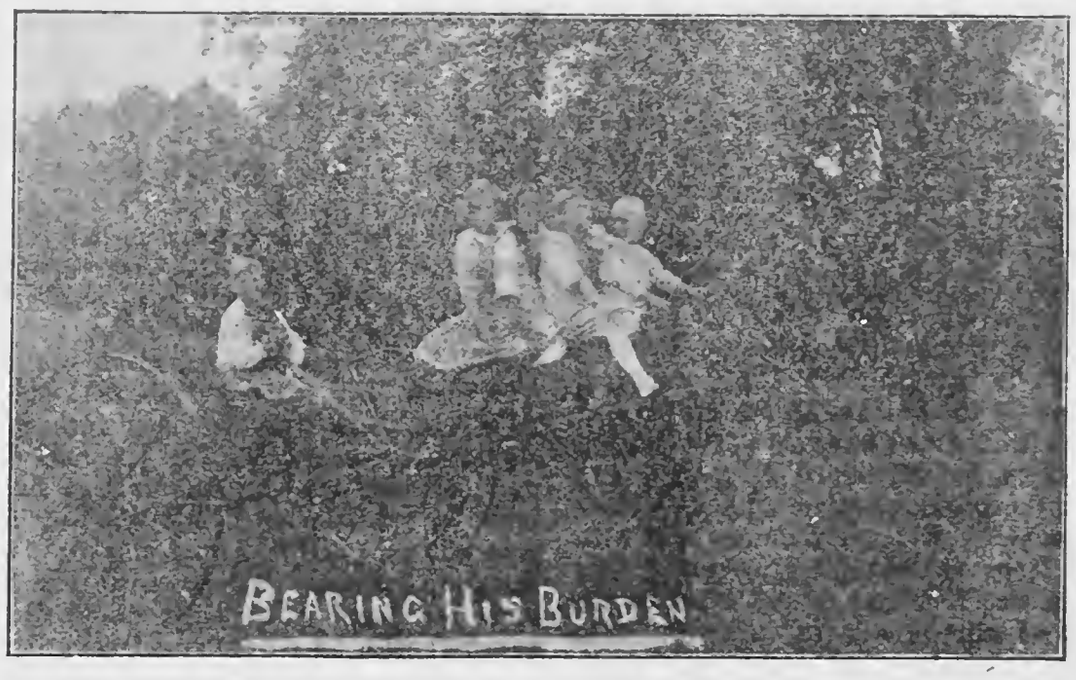
Household Management

On Selfishness and Hobbies.

IN an effort to prove the husband is not selfish when he buys improved machinery for himself and lets the wife go without, an editorial in a farm paper contains the following:

"The home produces nothing. It consumes. The production of the farm is all for the support of the home and while it is the duty of every husband to make the wife's labor as easy and pleasant as possible, the patent washer or bread-mixer will not bring in a penny, while the new horse-rake or mower will."

The writer has snubbed up against men who held similar opinions and has reached some conclusions which may be helpful to other women. The sooner it is realized that it is waste of energy to attempt to alter the opinion of such men the better, but there is always a chance to do something with yourself and when



once fairly interested in that undertaking the wonder will be that there was ever any time for bothering about the other fellow.

First of all take stock of yourself. What do you amount to anyway? Do you take any intelligent thought as to whether you are doing your work in the best way, or whether you are doing what might well be left undone, or leaving undone something essential? Many women ride a hobby, without bit or curb but with whip and spur.

There is the woman that irons everything, even the socks; another sweeps and dusts in season and out. One such woman got broom and dust pan and swept up a trifling bit of litter a caller made, to the latter's discomfiture, although later she laughed and said: "It's just her hobby." Still another woman mends long after the garment ceases to be worth the time spent on it. I counted nine patches on one side of the front of a man's work shirt. I laughingly told the wearer he looked like an animated rag-bag. He smiled sheepishly and said he wanted to see how far she would go. There is the woman who waits on her children when they might better be waiting on her. A four-year-old girl who could dress herself except a few buttons at the middle of her back—even to lacing her shoes and tying the strings in a double bow-knot, an achievement which cost her many patient trials and many an earnest "show me," looked on with disapproval while a visiting aunt dressed two cousins near her own age. A housewife caring night and day for a member of the family through a long and serious illness engaged a girl of 19 to do the house work. The girl said she could bake and cook, but when she came to try, it turned out that her mother had made the baking fire, had seen that the bread was light enough, and so on. So in addition to her duties in the sick room the nurse had to teach the girl to work independently. The mother had made the all too common mistake of doing half the work herself and letting the child take all the credit. It is quite likely that the men who so lightly esteem the home as a producer had such mothers. Whatever the home contributes toward bringing in the penny they take the credit for themselves. If we are honest with ourselves there are few of us who cannot find some unprofitable hobby to dismount.

If women would devote the energy they waste on their particular hobby toward acquiring the labor-saving articles there need not be a bread-maker without a bread-mixer or a washing done without a machine and wringer. And these are but a beginning. Once started you push on and on, seeking other worlds to conquer, and then, some day, you become aware that the other fellow has changed his opinion, and looking back you wonder if he wasn't half right after all. C.

Kitchen Tools; Household Conveniences.

PART I.

SAVING TIME.—While shopping in the house-furnishing department of one of New York's stores I happened to think of Mrs. B. L. C.'s article about simplifying housekeeping, so kept my eyes open with a view to seeing things that would be helpful to the farm housekeeper and would urge all those who can to buy as many as possible of the things I am going to describe, for there isn't one but what would save both time and labor. The first thing that met my eye was perhaps the best of all, for it would save more in time and effort than any other one thing in housekeeping. This was a round, heavy wire dish draining basket, just the size to fit into the ordinary dishpan. In the centre was a fine-meshed wire cup for putting knives, forks and spoons. This is intended for the inside of the rinsing pan and after the dishes are scalded the basket is lifted out and the dishes left to drain and dry. The price is 29 cents, so that if there was a large family, two could be used instead of one. When you think of saving the time it takes to wipe dishes—let alone washing and ironing dish towels—three times a day, year in year out is certainly is worth the effort to get one.

Right alongside of this was a wire dishcloth attached to the handle of a metal dish scraper. Think how convenient that would be when you had a kettle which had had the food burned a little, thus necessitating scraping it off. Price 10 cents.

POTATO RICER.—For a little thing a ricer is really about the most useful. Primarily it is supposed to be used for potatoes. After the potatoes are boiled they are sprinkled with pepper, salt and butter, then put them in this ricer, which makes them look like rice—hence the name. There is a heavy tin perforated bowl held in an iron frame which has a long straight handle and above this is another iron bar with a disk at the end of a rod in the middle which is pressed down on to the potatoes, thus forcing the potatoes through the holes in the bowl. The bowl can be taken out of the frame to wash it. It is just the thing for taking the skins from the cranberry sauce, or apple sauce (do you make your apple sauce that way? If not, try it—wash the apples and cut out any wormy or rotten spots and then stew; when done press through the ricer and sweeten to taste. It is much quicker to do it this way). When making grape jelly or jam, if you have not got a fruit press it is just the thing to use. When cooking Summer squash wash and cut up in small pieces and cook; when done remove seeds and skins by putting through the ricer. After cooking pumpkin put through ricer so as to remove lumps and strings. It seems as if there was no limit to the number of things daily coming up in the cooking line where the ricer saves time and work. The price is only 25 or 35 cents, according to size.

THE LITTLE CHURN.—For the woman who makes her own butter there is a little glass jar with wooden paddle inside that will make three pounds of butter in from four to 10 minutes. Personally I have never used one of these but have friends who have, and they are very enthusiastic over them.

EGG BEATERS.—The rotary egg beater is another saver of time, and I do not think you would find many city housekeepers without one; but I have known several country housekeepers who would only use a fork to beat eggs and cream, saying it was so much better. But that is only a notion, and when there are four or six blades to do the work of one fork there can be no question of the time saved. Price 15 cents up.

FOOD CHOPPERS.—These cost from 98 cents up and are certainly a very great saving of time. If you want hash for breakfast it only takes about three minutes to put onion, meat and potatoes through the chopper and you can have it just as fine or as coarse as you wish, for there are three different-sized cutters that go with even the cheapest of these choppers. And think of how many things you ordinarily chop. While on the subject of hash let me pass along something I learned just a short time ago. We always liked onion in our hash, but invariably the taste of the onions would come up in my throat and the children complained of the same thing. A short time ago a woman told me to fry the onions until brown before I put the potatoes and meat in, and that I would have no further trouble, as the onions needed more cooking than the other things. This I found to be true, and I do the same thing when I make Lyonnaise potatoes which are fried potatoes with onions and chopped parsley.

Dresses for the Girls

Making Over for Winter

By Esther A. Cosse

LIGHT-WEIGHT CLOTHES.—Ideas have changed with the times about the dress of the little women. Formerly they had to have clothes made of heavy materials, the heavier the better, since parents used to think it was necessary to have all heavy clothes. Now young girls wear their ginghams, muslins, or cotton material all Winter, especially for school clothes. Parents in these days

PLAIN GINGHAM DRESS.

have come to realize that what they need are heavy coats, furs, etc. They need a warm jacket under the coat if it is very cold, something to keep their ears and hands warm and then they are ready for any emergency. In fact, some days they wear all their heavy clothes, and the next leave some of them off. If grandmothers could come back to earth and see little folks go out one day bundled to their ears in warm clothes and the next day with just an ordinary coat they would be horrified, and would feel sure that they would be down with pneumonia the next day. But it is not so, since people are now dressing according to the weather. Our seasons are so irregular that this is necessary. If we went out every day with the same amount of clothing for both warm or cold days, many would have pneumonia which can be avoided by dressing for the weather. If little folks wear light-weight clothes when they go to school, they can remove the heavier outer wraps and be comfortable while inside, since the schools are often too warm for the good of the pupils.

LENGTHENING A SKIRT.—Gingham dresses will get too short, but don't throw them away. One way to alter the length of a skirt, is to use the outside skirt as a tunic. From a piece of old or new white material, make a skirt and sew a fold on the bottom to make it long enough for the child. Make the fold about three inches wider than is necessary and the white lining will not show if the little one sits down, as the skirt is apt to draw up a little. If the sleeves are too short or too narrow, insert a piece of the plain material which you are using for the skirt. If the waist is too narrow, cut it up the front and after making a vest or guimpe of either white or colored material, sew the front of the waist to the vest. This will give the necessary width. If the back is too narrow do the same with the back, only cut it up the center back and hem the insert.

ALTERING A DRESS.—Many times a dress is good, but the child has grown tired of its style. To bring it right up to date, take a piece of embroidery or lace, four inches wide and make a pretty little collar which can be sewed to the waist to change the appearance. Measure from the center each side, three inches and make a square corner. Shape it out a little in the neck. Get what is called collar wire, really light weight lace wire and wire it up the center of the back and to each point. Many times we have this wire in the house. Go to an old hat which has been trimmed with a bow of ribbon. Rip out the ribbon wire, if white, and cut one of the wires from the edge. You will find three of these covered wires in the ribbon wire, but one is sufficient to hold a collar. Turn the edges back firmly or they will slip out when they are worn. A tiny tuck is sewed in the lace and the wire run through and tacked on each end. Then sew the collar to the waist. Take the remainder of the yard and a quarter and make cuffs for the sleeves. Perhaps you have a piece of plain material in the house which would match some color in the gingham. Make a pretty belt with two ends, one longer than the other. The ends should be lined and one cut square and the other round. Sometimes the waists are too short, insert a belt of some material and cover it with the plain color just described. Also make collars and cuffs to match.

MAKING OVER.—For silks, woolen or heavy cotton materials, laces and ribbons are used to redecorate the dresses. Many times mother has had a dress which could be made over into a dress for the daughter. These dresses should be carefully ripped apart, cleansed, usually with warm water and white soap, though it is possible to buy special soap for woolen materials. I had a blue silk dress which was satin on one side and like crepe de chine on the other. The satin side was, of course, the right side. The dress was good, but on account of not being used very often soon became out of style, so I decided to make it over for the little girl. She was delighted with the idea of having a new silk dress. So I ripped it

GINGHAM DRESS FINISHED WITH WHITE COLLAR AND SASH.

carefully apart, except the lining, which was large enough for the child, but a little short-waisted. In order to save as much time as possible I washed the lining and put it on a band, which made it right. The silk I also washed, and pressed on the right side while it was wet. I say wet, but it wasn't exactly as it came from the water. I hung it in the shade for 15 minutes, then wrapped it in a towel and in a short time ironed it. By ironing it on the right side it was necessary to use the wrong side, but it was beautiful. All dust and spots were taken out by gently rubbing between my hands while in the lather, but I didn't touch the silk with the soap since it would have spotted it. Then I laid on the pattern. Every piece was pinned to the silk before I started to cut. I found I didn't have quite enough silk, so I tried to match it in color and bought a little velvet and some cream lace. The velvet was used for a fold about the bottom of the skirt and for a dropped girdle with a long end, lined with silk. The lace made the front, lined with a small piece of white net, and the rolling collar, such as was described previously. The little girl had a beautiful dress, and it cost very little for the trimming, or $1 for the entire dress.

ALTERING A COAT.—One of my long coats was made over in the same way, but there was very little work attached to it. The coat was ripped and damped and pressed, which was done by dampening with a wet cloth and ironing on the wet material. Of course, the material used for wetting woolen material should be a cotton that will not shed lint. Old muslin is often used. Then after wetting it thoroughly place it over the cloth and iron, but the iron should never touch the wool, as it will burn and shrink the cloth. As the coat was seamed, the seams were pressed very carefully. The cloth was brown, and after discovering that red was to be a popular color this season I found some pieces of red velvet which had never been used. It was wrinkled, so I heated a flatiron, laid it upside down on a high pan, then placed the wet cloth over it and drew the velvet over it in order to steam out all the creases. When this was done I had enough to make and trim the cuffs and collar. The coat was then lined with the lining which had been used in the large coat, but I had washed and ironed it. When completed the coat was taken to a tailor to have the button holes worked in, which cost me 10 cents for each one of the large ones, and five cents for the small ones.

REMODELED HAT.—The child needed a hat to wear with the coat, so I started out to find something to make her a new hat. From one that had been used the previous season I ripped some black velvet, which I steamed. Then from another I ripped makings and found a frame which after the crown was made a little lower and the brim a little smaller was one of the new rolling sailors. This I covered carefully with the velvet, putting on the top brim first and drawing the edge over the brim to the facing and sewing with a firm stitch. Then I covered the crown. The piece was large enough to cover all the way across and I drew it to the base of the crown and sewed it. I didn't have enough to turn in the edges, but afterward drew around to cover the stitches a narrow piece of black ribbon (No. 5). A tailored bow with four loops finished off this band. The facing was then put in and fitted to the edge. I slipped a wire under the edge and sewed in by stitching back and forth with small stitches under the wire, but with invisible stitches on the top side. The girl was very fond of flowers, so I made some pink poppies from ribbon and silk which I had about the house and used some foliage from flowers which I had. I tore some old flowers apart to get the centers, and backs and the rubber stems. The petals were cut out of silk with rounded edges at the top and measuring 2½ inches. The two pieces were run together on the wrong side and turned inside out. Four of these petals were made for each flower, then sewed

GIRL'S HAT—PLAIN TRIMMING.

to the center and the back slipped on, then the rubber stem drawn over the wire. Two poppies were used and one bud, which was made of the silk to look like a rose bud. These flowers were tacked on the left side. To change off with the flowers I made a bow of ribbon, which I always pinned on with safety pins. The child could then change and saved me the necessity of making two hats. For school, I made a scarf of a piece of fancy ribbon, by sewing fringe on the edge and draped it around the crown. The hat was practical and it didn't make any difference how many times it was knocked to the floor, the trimming was just as I left it. The child didn't come home from school with a bow that was crushed or soiled, but was always as fresh as when new.

Mothers used to think they had to make children's garments big to allow for growth another year. Now they don't do that. Even the hems in the skirts are not doubled under as they used to be, but an ordinary hem is used, and when it gets too short, face it, or if necessary, use a false hem, which is made by stitching on a piece and having the stitching where it is sewed on covering the piecing. Materials are so reasonable and ginghams can be bought in such pretty designs that mothers can make garments of this sort at very small expense.

The Cat and the Door Bell.

A MORE perfect example of worthless feline felicity than Ginger never lived; and yet he lives, and no one suggests that he might better make room for a cat with fewer toes upon his feet and a greater disposition to lay them upon the rats and mice that occasionally show themselves on the place. Topsy, the little black mother of all the other cats upon the farm, is worth many times her weight in steel traps, and the enthusiasm that she annually shows for "better babies," and more of them, makes her rank as almost an expert in eugenics. Big brother Mutt lets few days pass by in which he does not bring to the house some trophy of the chase, and he treads the path as proudly when he has robbed the cradle of an infant mouse as when he carries a rat with tail nearly as long as his own and body that makes its captor hold his head high to keep it from the ground. He couldn't be spared, but Ginger, with black feet that look as though they were encased in padded boxing gloves, was never known to eat any game that was not brought to him, or to display a useful trait of character in any line. When small, he was so full of kinks that Ginger seemed the only name appropriate for him, but in his adulthood he faces life with sublime confidence in three square meals a day, ready provided. Behind that confident, optimistic, smile of his lie some brains, however, and these have probably been the means of prolonging his life, and may do so indefinitely. If he hadn't them how could he have learned that the way to gain entrance to the house was to ring the door bell and wait for some one to open the door? Our sitting-room door is armed with an old-fashioned gong that is struck by pulling down an outside lever. This lever has a porcelain knob on the end, and requires some force to operate it. When about half-grown, Ginger learned in some unknown way that if he would reach up and hook both fore feet over that white knob and then pull down until he heard a loud bang some one would open the door. No one ever made any effort to teach him this, unless it might have been Mutt who stands up and pounds the door knob with one paw when he wants to come in, but, in some way, he certainly learned it and he put his knowledge to good use. Through the Summer a screen door kept him away from the bell, and it was thought that he would probably forget his skill as a bell-ringer. The other night, however, the screen door was fastened back, and it being somewhat cold Ginger evidently wanted to come in and warm his 28 toes. About midnight a loud ring at the door awakened the man of the house and brought him to his feet. Upon opening the door, in strutted Ginger with his everlasting smile and confident purr. He promptly went out again at the back door, however, and the man returned to bed. Nothing again disturbed the family's sleep until about five o'clock in the morning, when the door bell rang. Nobody was fooled this time and nobody went to the door; again the bell rang, and again and again until it was struck six times

GIRL'S HAT CHANGED BY DIFFERENT BOW.

in succession. Maybe there was a neighbor at the door and, if not, such persistence certainly called for recognition. The door was opened, and in gurgled His Inky Blackness and padded his way to the sofa where he knew that a soft blanket lay folded. M. B. D.

Women Help Themselves to Comforts

Getting a Pretty Yard.

THERE is no doubt that farmers, as a rule, are more indifferent to the beauty of the grounds about their homes than they would be if they understood two things; first, that an actual cash value, by no means inconsiderable, is added to their property by pretty surroundings, and, second, that their "women folks" would be much happier and better contented to remain on the farm, if they had flowers and green grass. Anything that tends to depress a woman on a farm, reacts on her husband and family, and the converse is true. The above is for the men. Now for the women.

Men on the farm have become accustomed to women perennially scolding because they do not have pretty yards. Scolding? Well, the Bible says, "He that is often reproved hardeneth his neck." Profane writers have remarked that "the longer you keep an egg or a man in hot water, the harder they become." Did you ever notice that certain "must haves" always come some way or other? Make your beautiful yard a "must have," and stick to it like grim death, never letting go for a day, and you will get it. You need not expect to get it easily. We cannot change old traditions quickly. A good many different strings may have to be pulled before you get what you want. A little psychology is not amiss here—a realization that you must approach a mind in a certain way to produce certain reactions. The first thing is, never lose patience, and never speak crossly about this, no matter how much you may scold about other things. Remember the fable of the sun and the wind, who tried to see which could make the traveller throw aside his mantle, and how the wind tore with all its force, which only made the traveller cling the more tightly to his cloak, while the sun shone on him and melted it off him in a few minutes. The following ways have been tried by different women with more or less success.

1. Cutting out all fancy cooking and giving only the plainest kind of food, which fortunately is nourishing, so one need not feel one is starving a man if he gets beans and corn bread instead of lemon pie and doughnuts. When asked for a different fare, say it is "extra work but you will trade your time for the time of a man in the yard."

2. Getting a woman in the house and letting "him" pay for her while you go out and do the work yourself. You can do it. O, yes, you can. Helen Albee tells how, in her "Hardy Plants for Cottage Gardens," which it would pay you to get. None of you can have as discouraging an outlook as she had, and she conquered and tells how she did it.

3. Stop helping to milk. Let the chickens go, and let "him" buy eggs or go without. Don't raise any more turkeys. Milking is a man's work and you don't get paid a man's wages for doing it. If you did, you could hire a man to make the flower gardens. Turkeys and chickens will do if you can make money enough on them to hire a man for the yard. Otherwise "cut them out" if you want a garden more than anything else.

4. Advertise for a man who understands and loves work in a garden but who is confined to office work in a city and state that he can have board and room in the country for his services in that line. It is astonishing how glad these office and indoor men are to have a chance to get outdoor and country vacations without having it cost them anything. The expense of living in a city on a salary none too large, leaves them little cash for outings.

5. If you can teach anything advertise to exchange lessons for work. Sometimes you can get a foreigner who wishes to learn the language and who would gladly work three months for the sake of thoroughly mastering English correctly.

6. The chances are, if you are like most farmers' wives, that you are boarding hired men and doing a lot of extra work for them. This should be recognized and paid for, either in work on your yard, or in money, so that you can hire the work. Strike on doing something for nothing and claim your right to have those cheerful God-given, beauties, the happy flowers, all about you as you stay in the one spot to which farmers' wives, more than other women are confined. Stick to it that if you are nailed to one spot, you must have that spot beautiful.

ELLEN EAMES DE GRAFF.

Southern Outdoor Flowers for the New York Trade.

WE are often asked for advice as to hardy flowers that may be grown outdoors in the South for the New York flower trade. We cannot suggest that there is any great fortune in this work, but the trade offers possibilities, and may

"THE TRIPLE ENTENTE.

in time develop like the flower-growing in the south of France. A recent query in the *Florists' Review* asked what jonquils, Narcissi and peonies should be grown for this trade in Western Kentucky, and how they should be packed. The following advice was given by F. B., in the *Review*:

As to the most profitable varieties of Narcissi and jonquils to grow outdoors for the wholesale cut flower market, there is only one true jonquil that would probably prove profitable; that is, the campernelle, variety Odorus rugulosus. There seem to be two varieties of this sent out from Holland, the true Rugulosus being much larger than the other and grown on longer stems. The first cost of the bulbs is slight and they increase more rapidly in this country than any other Narcissus of which I know.

Of the trumpet daffodils, Emperor, Empress and Sir Watkin are the three varieties that will prove the most profitable, all things considered. Emperor and Sir Watkin are rather better, possibly, than Empress, because of color, and also because Empress is more subject to disease. As soon as Glory of Leiden can be bought as low as $3 or $4 per hundred, it should prove the most profitable of all, for it seems to be robust and certainly produces a much larger and finer flower than any of the others.

When there is a demand for the light, airy varieties, or for extra early ones, Narcissus incomparabilis Stella, Leedsii type, Duchess of Brabant and Mrs. Langtry are profitable. Barrii conspicuus can be bought cheaply, blooms freely, and usually finds a ready sale, though none of this latter class brings as high a price in most markets as the trumpet daffodils. Of the Poeticus narcissi, N. poeticus ornatus and King Edward VII. are the most profitable. The latter variety is high priced, but, where the market will pay for extra quality, is worth the difference.

It is difficult to name the four best peonies, but undoubtedly P. festiva maxima and Queen Victoria in white, Felix Crousse and Francois Ortegat in red, are as good as any. There are many good pinks of about equal value; P. edulis superba and Rosea superba are the two varieties that are perhaps most widely grown, though Modeste Guerin is better than the latter.

Shippers here, in northern Tennessee, usually do not ship in baskets, but in good, clean boxes, well lined with paper. The blooms are carefully packed and held in place by means of wooden cleats, nailed over the stems in such a way as to hold them down firmly and yet not bruise them. Generally these cleats are put in over every layer of blooms.

THE STUTTERING CHILD.—Dr. Smiley Blanton of Wisconsin University, in an article on speech defects, says:

"It is one of the unfortunate things that stammering and stuttering are considered funny. It would be less perpetually the material for jokes were it better known what a great percent. of this trouble is thus caused by imitation. Sometimes a stuttering child will start a whole school. We should use our influence to prevent characters on the stage from simulating stuttering as a means of getting a laugh. Severe injuries or surgical operations or great fright may induce it. One case is on record where a boy was chased by a vicious hog; in another instance frogs were placed in a child's bed as a practical joke, frightening him so that he became a stutterer. It is essentially a disease of childhood and it is then that the cure is easiest. A few may outgrow the disease, but most untreated cases last on into adult life. As soon as the disease begins the child should be examined by a competent physician or nerve specialist if possible and any abnormal physical condition treated, and the child then placed in the charge of a trained teacher who has had experience in teaching stutterers. The treatment consists mostly in carefully re-educating the child's speech mechanism. With some the cure requires only a few weeks, others much longer. All cases can be cured or greatly helped."

GRASSHOPPERS AS FOOD.—Last year one of the farm papers startled the chicken world with the story of the woman who "put up" several barrels of dried grasshoppers as hen food. Now comes President J. H. Waters of the Kansas Agricultural College: "Dried grasshoppers are used as food in the Philippine Islands. Three thousand tons of grasshoppers were marketed in Manila in a year. Some good and tempting dishes are prepared from them. There is a grasshopper plague every 10 years in the Philippines, and the problem of combating the grasshoppers in a warm climate like the Philippines is more difficult than in countries where cold weather serves as a check. There are many acres of unsettled country which serve as breeding places for the grasshoppers. The method used in capturing the grasshoppers is to organize a drive. A large shallow tank is constructed which has wings of galvanized iron. The tank is filled with kerosene. The natives then start the drive three or four miles away and close in gradually, driving the grasshoppers before them into the tank. The grasshoppers are then dried and sent to market."

HOMES FOR WOMEN.—Years ago it was common to find in every farm home middle-aged women doing part of the work of the household for the sake of a home, or at least very small wages. They were treated well and looked after the household wants as faithfully as though it were their own home. Since coming back to the old farm to live we find very few of these helpers, but we believe there are in cities or larger towns many women who would be happy and contented in such situations; a place where they could have comfortable rooms, good food and light work, light compared to the old days when cheese was made in nearly every farmhouse. This subject might be an interesting one to other families and would be an interesting subject for correspondence through the medium of your good paper. M. B. M.

Indian Bead Work

NOTHING is more fascinating or more in vogue at this time than **Indian Bead Work articles.** We have procured an outfit for making these articles, which will be sent, delivery charges prepaid, for

ONE NEW YEARLY SUBSCRIPTION

OR

THREE YEARLY RENEWAL SUBSCRIPTIONS

(One of these may be the renewal of your own subscription for one year.)

This outfit consists of a Patented Loom for making articles, an instruction and design book, a spool of cotton, twelve H. Milward Sons' needles, seven bottles of colored beads—dark blue, green, light blue, black, red, yellow and white—a complete outfit to start the work.

Every woman knows and appreciates the value of these home-made articles.

Your neighbor needs *The Rural New-Yorker.* If he is not a reader get his subscription. If he is a subscriber get his renewal.

These articles will not be given with subscriptions—they are sent as rewards only (in place of cash) to our subscribers and friends who, acting as agents, send us subscriptions as indicated.

THE RURAL NEW-YORKER, 333 W. 30th St., NEW YORK CITY

An Old-fashioned New England Dinner

Cooking the Turkey and "Fixings"

Reported by Edna S. Knapp

PLANNING THE MEALS.—Mrs. Cook came into her pleasant sitting-room smoothing down the folds of her pretty white apron. Sitting down in her favorite rocking-chair in the bay window she remarked:

"Now I can sit down a minute and rest."

"What would you have, if you had just what you wanted for a Thanksgiving dinner and had to do all the work yourself?" I asked.

"Soup first; we all like it and I make lots of little broths and stews. I'd have oyster crackers with it. Turkey, of course, with dressing, that's the principal thing, don't you think so? For vegetables, have squash baked, shell down, you know, because the flavor is so much richer that way; turnips, onions, we eat those every day in the year; white potatoes, mashed I think; cranberry sauce, jelly is not so good, the best part is in the skins. I think that is vegetables enough. It's a regular nuisance to serve so much, and people don't want it. Sweet potatoes taste a good deal like squash, so I never have them for Thanksgiving. I try to cook something that goes with the dinner, not something you get every day in the week."

"What would you have for bread?"

"Rolls, I think. I've always made a good many," answered Mrs. Cook. "Now about dessert. I always make a plum pudding with hard sauce. Some people have Indian pudding, but we have it once a week anyway, so don't want it for Thanksgiving. You wouldn't need more than one kind of pie; mince pie is too hearty to serve after such a dinner and tastes a good deal like plum pudding. I guess I'd have pumpkin pie and grapes, pears and nuts. I don't believe anybody'd feel like eating an apple after a hearty dinner."

"Would you serve coffee?"

"Yes, I'd have the coffee poured any time during the meal folks wanted it. They used to drink it with their meals but now most people sip their coffee after they're all through."

"Now please tell me how you would cook all these things and how you would manage your work."

"I'd make the pudding the day before, that is early enough in my opinion, and Thanksgiving Day I want the oven for the turkey. I don't care for a steamed pudding. I'd cook the pumpkin the day before and mix up the crust: a pumpkin pie always has a better taste if eaten the day it is made, and who would mind filling a pie or two Thanksgiving morning? You know yourself it isn't any work at all. The cranberry sauce could be made early too." She picked up from the table a yellowed old note book.

"This looks as if it had kept its centennial," she laughed. "Here is my recipe for soup. It is an old timer. Take as much soup from the stock pot as you need, it may be any kind, but nothing is nicer than chicken broth. When I have a fowl, I boil it (parboil) the day before and let it stand over night in the water it was cooked in. That makes it very tender, and the water can be used for broth, you can roast the fowl all right. To the strained stock, add a large cup of mashed potato, season to taste and cook five minutes. I like to add a few bits of vegetable, carrots especially, in their season. Are you fond of carrots?"

"Indeed I'm not. Sister is, father says he dislikes them and then eats them."

"Now, about my rolls. If you follow these directions exactly, you'll have lovely rolls. You have to set them at night, of course, to bake them in the morning. Take a pint of milk scalded and cooled, one teaspoon salt, one tablespoon butter, you ought to melt this in the milk, one tablespoon sugar and half a yeast cake dissolved in one-third cup of lukewarm water and flour to mix. I mix this with a silver knife, set the dough to raise and in the morning roll out about three-eighths of an inch thick, and cut with a round cutter. Press across the center with the handle of the knife, brush with melted butter, butter the edges slightly, too. Fold the rolls over, let them rise a while and bake brown in a hot oven. Now don't they sound good?"

"They certainly do."

She brought out another cook book here; it looked nearly as old as the other one and was worn to holes in places. She continued: "I never use any egg in the turkey dressing. Some put in oysters, I never do, and I don't like to use salt pork. It pays to singe the turkey, you know it has sort of hairs all over it. I like to cut the neck off short and get the crop out that way. I *always* bake my turkeys in a covered pan with a cover that shuts down tight. You don't have to baste it so often and the outside never gets hard. You have to look at it once in a while and baste it, you can

"HE MAY BE THANKFUL FOR GRANDMOTHER."

tell by looking. Try this way for the dressing, you'll have to judge by the size of the turkey how much you need. Use stale soft bread, baker's bread is very good. Season lightly with salt, pepper and onions and thyme. Moisten by tossing in hot butter in the frying pan until it is brown and crisp. That is all you need do."

"Won't that be rather dry?"

"No, certainly not. The steam from the turkey will make it moist enough. It is very delicate. I just boil the onions and mash them, season with salt, pepper and butter, and treat the turnips the same. I always heat the milk for mashed potatoes and beat them up light, they look pretty dotted over with bits of butter. Our favorite way is to take small potatoes, or cut up large ones, and boil them in milk, watching them so they won't break. Then make a white sauce and pour over and serve at once."

"That sauce would want to be pretty thick, wouldn't it, so it wouldn't run on the plate? And wouldn't it be rather a job to watch the potatoes closely at the minute, when you had so much to do?" I asked.

"In that case, maybe we'd better say mashed potato, that is always good." Mrs. Cook answered. "I'm not partial to steamed pudding. Who wants to steam one several hours when you can bake it so much quicker? This is the rule I use. Butter a two-quart pudding dish, split crackers and put in a layer of raisins, dot with butter and sprinkle with cinnamon and nutmeg, then another layer of crackers and continue until the dish is full or nearly full, I mean. You must remember that it swells. Have the last layer of crackers and dotted with butter. Beat two eggs light, dissolve two-thirds of a bowl of sugar and a scant teaspoonful of salt in the milk, about three pints. Add the eggs and pour slowly into the dish so as not to disturb the layers. I fix this over night and put a plate on top to weight it down. Add more milk in the morning, if it is needed. Bake slowly for two or three hours. The sauce is one cup sugar and one-half cup butter creamed and an egg."

"How about the pumpkin pie?"

"Well, to get the real pumpkin flavor, you want to cook the water all out of the pumpkin so it will be dry. The best way is to cook it on top of the stove all day, or you can bake it in the oven shell down like squash. To cook it on the stove, pare the pieces and cut fine and steam until soft, then mash and cook uncovered on back of stove until the water is all out and it is dry and smooth. Have the milk hot for making the pie, you strain the pumpkin, of course, add the usual spice and egg. I always put a tablespoonful of molasses in each pie, it gives a good color and adds to the flavor. I always use lard in my pie crust. Is there anything more you want to know?"

"I don't think you told how you make cranberry sauce. That was extra good for dinner today."

"Well, I must tell you. We had six or seven quarts on our own bog this year, we haven't had any for years. We would have had more but the frost got there first. Wasn't that too bad?"

"It certainly was."

"Make the sauce like this. Put the cranberries in an earthen dish; no other kind will do. Use two cups of sugar to one quart of cranberries. Cover the dish tightly, set it on the stove for about 10 minutes, anyway until the cranberries pop furiously. Then take from the fire still uncovered and set away. Don't uncover them until you want them to eat, the steam does the cooking and that makes the jelly. This is the best way to cook them. I think that is all."

Miss Cook came in from her day's work in school and listened for a moment to our conversation. "You make me hungry!" she said.

Honey As a Substitute For Sugar In Cooking and Preserving.

THE rapid advance of sugar caused many to consider honey as a sweet in the matter of cooking and preserving. Mr. E. R. Root of Ohio, an authority on bees and their products, says: "Cakes, cookies and household delicacies may be kept much longer if honey is used for sweetening in place of sugar or the low-priced syrups. This of course is due to a disposition in honey to absorb moisture." Mr. Root says: "I could tell the housewives about some honey cookies, or honey jumbles as they were called, that were kept for a very long time, in fact so long that I am afraid the ladies would have trouble in believing the statement."

In reply to the question which would arise in every woman's mind regarding removing the sugar requirements from the recipe and using honey, Mr. Root says: "Danger lies in eliminating sugar from a recipe and substituting honey. It is apt to result in failure if no other change is made. The flavor of cakes or cookies made with honey is somewhat different from sugar, and some people may not like the flavor quite as well, while others may appreciate the change. Ginger cookies made with honey have a very different flavor from those made with Orleans molasses, and nine out of ten persons consider the cookies made with honey in the recipe very good."

What about the use of a cheap product?

"The housewife will seek to purchase honey as reasonably as possible. Low price need not indicate impurity, but it does mean usually that honey is darker in color and stronger in flavor than the lighter, milder honey which sells at a higher price. Yet because honey is dark in color it does not mean that it is strong in flavor, but it is true that strong honeys are usually dark in color. One should select for cooking a reasonable priced honey, and one not too strong in flavor. Alfalfa honey is almost always quite light in color, and has a minty, cinnamon-like flavor, which makes it quite desirable for cooking in my way of thinking although some get tired of the minty flavor while others grow suspicious and feel that something has been added."

"Is honey an efficient sweet for preserving?"

"I am very enthusiastic in regard to the use of honey in canning fruit. It is more healthful than cane sugar or New Orleans molasses when put to any use for sweetening. Strawberries or peaches especially when put up with honey retain their natural color longer and acquire richer flavor, approaching more nearly the flavor of the fruit when fresh. One must enjoy strawberries canned with honey to appreciate the richer and more natural taste, and the brilliant red color instead of the usual pale brown. In our home we have used both sugar and honey in putting up, say a bushel of peaches, and it is true that we can pick out the peaches canned with the honey by the brighter color."

The housewife may wonder if the flavor of the honey will survive at the expense of that of the fruit. Regarding this point Mr. Root says: "The flavor of fruit canned with honey is most excellent. Strange as it may seem, the flavor of the honey is not perpetuated to any marked degree. There is some difference, and most people consider the fruit so put up, richer and nicer in every way."

"You may imagine that I lived a happy life for a few weeks, three or four years ago when my wife, my brother's wife and our three sisters were testing out some recipes in which honey supplants the use of sugar. I insisted that I should have samples of everything made with honey, and it was indeed very pleasant."

RODERICK, aged six, became incensed at his mother, and declared he didn't like her any more. His father suggested sending for Uncle Sam to take her away by parcel post. Then Roderick whimpered: "Well, I don't like her, but I need her."—Chicago Tribune.

The Land of Fulfillment

A Story of Homesteading

By Rose Seelye-Miller

(*Continued from page 1297.*)

"OH, yes—after we make final proof and get out patents we'll be free." And yet, that thought did not give either boy the expected sense of exhilaration. They were not free, for they were tied by invisible cords to that land, to their homes, to their friends, to the country. For the man who has once breathed the Western air, lived the Western life, grown and expanded with the largeness of the plains, can never go back to the circumscribed areas of smaller things and people and places.

The fifth year of land cropping was nearing its completion, and the advertisement for final proof was running in the local papers according to law. The crop on Jim Maynard's land had doubled that on the shale bank that last year. The six gingham aprons given to Nate by the thrasher crew, the first Fall on the plains, had worn themselves out, one by one upon the line near the shanty, and the flapping folds of the last of the six attracted a party of real estate men, who were out ostensibly either to buy or sell land. Nate and Norm made the party welcome to their simple dinner, and after the usual chaffing about the apron, and the usual praise of the good cooking, the men wandered about with apparently aimlessness, lookiug at the land.

"What's the reason the crop on this land is so much lighter than it is over there?" inquired Mr. Measman the leader of the party, crumbling some bits of shale in his fingers as he spoke.

"Oh, I don't know," Nate replied. "My partner, who knows more about soils than I do, says this land would make an ideal cattle range."

"Hmmm! Stony?" inquired Mr. Measman.

"No, you see what it is, just shale—old lake bed there, and the banks are nothing much but shale with a thin veneer of good soil, which has drifted ou from the better land near by. The claim next us is as rich as fruit cake, and the valley there is knee deep in land like lard."

"Curious?" Mr. Measman commented, without interest. "Going to stay here?"

"Oh, I reckon," Nate said easily. "We expect to make final proof pretty soon."

"Own half a section, I suppose!"

"My partner and I own a section, or will when we get our patents."

"You and your partner come out together?" Mr. Measman inquired, apparently by way of making conversation, even though it seemed to bore him.

"Drove out with oxen."

"Plucky! I call that great! And staid here all the time since!"

"Oh, practically, we went away once or twice to work, but we've lived here really."

"I suppose you eat and sleep together, and keep a few old clothes, in the other shanty, to indicate possession," Mr. Measman laughed lightly.

"We've slept," Nate replied laughing, too, "right across the dividing line, unless we've been restless and kicked over to one side."

"Pretty cute!" Mr. Measman remarked with approval. "You don't want to sell out? I buy and sell, you know." There was a keen look in Mr. Meas man's eyes, although his voice was nonchalant, if not bored.

"I guess not—just now," Nate said slowly.

"Good grit, I admire your spirit. It's just such steadfast men who will build up this country and make it one of the grandest in the Union."

"Make it grand!" cried Nate. "It is already made, and made grander and more wonderful than any man can make it or build it, or finish it." Nate flushed, a little, and the two walked back to the edge of the bluff, where Mr. Measman again picked up a handful of loose shale, and crumbled it carelessly.

"If you had that ground up and wet, it would make enough mud pies to satisfy the entire infant output of the world."

The other man coming up just then Mr. Measman turned to Norm lazily. "Got any price on your land?"

"Not just now. We're making final proof soon, and a relinquishment is not worth quite as much as a place with a patent. Want to buy?"

"I'm buying most anything folks want to get rid of, and I judged by what your partner said, you weren't any too satisfied with the agricultural value of your land."

"There is lots better land than this," Norm admitted cheerfully.

Mr. Measman was still crumbling shale. 'I like your pluck," he said. "I just thought I'd like to see you in a better location. See this," he said to one of the other men. "Wouldn't that make great mud pie timber for the kids? They could mould most anything out of it. I'd just like to see them lam into a box of that stuff." Mr. Measman spoke jocularly.

"Take a box," said Nate. "I've made all sorts of chicken dishes out of it, and it holds its own all right."

"No, no... It's too much bother," Mr. Measman protested. "Oh well, if you insist. I suppose I could take a little," and Nate swiftly ran down the bank, with a box, filled it with the finely ground shale, and brought it panting to the buggy.

"Oh, thank you. It's awful foolish lugging that stuff—but kids—" Mr. Measman said apologetically. "You're mighty clever boys. I'll give you ten dollars an acre for your land if you want to sell it. I've taken a great fancy to you—and you could take your money and buy land most anywhere. I could hunt you up a good wheat claim—"

Nate and Norm faced each other, and there was a quick, questioning in the eyes of both.

"Talk it over, and let me know. I'll be in Wetasket tomorrow."

"We'll talk it over," Nate said pleasantly. "It looks like a good chance."

Both boys watched the retreating vehicle as it disappeared over the hill, and then turning without words, they went about their work. It was not until after the evening chores were done, and the frugal supper over, that they seated themselves outside the shanty under the soft sheen of the coming night, that Norm spoke.

"That would be six thousand four hundred dollars," he spoke, as though the suggestion of sale had just been made, and in fact to both there had been no paramount thought. Both had gone over and over again, the idea of sale, the idea of possessing such a sum of money, with which to do as they pleased.

"It's a lot of money," Nate admitted.

"I don't suppose I could have made that much money back there, in a lifetime with Red and Roan, and every day full of work."

"You don't want to go back then?" Nate's voice was even, but questioning.

"Go back!" Norm gasped. "Why, I don't think I could live back there—after this!"

"And yet you don't want to go on here—this way?" Nate was relentless in his probing.

"Oh, I don't know," wearily. "I feel more collapsed facing this idea of selling, than I ever have with any work however, hard or continuous."

"Yet you want the money," Nate summed up grimly. I'm pretty sure we could take the money and go into most any town and make more with it in business—"

"Town!" snorted Norm. "I couldn't live in town, after this," and Norm swept his hand comprehensively towards the broad, beautiful land around him, where he could see their livestock grazing richly in an open space. They could see the coops where their young chickens were sheltered, and just then the cat came and rubbed against Norm, and it seemed as though that gentle touch, proved the balancing straw in the transaction. Norm lifted the cat to his lap, and stroked her gently.

"Say, Nate I'd rather sit here in this broad, open country, and hear this cat purr, than to hear the best singer in the world, cooped up in a city! And I wouldn't trade off one of Red's onyx hoofs for a whole row of candy jars or shelves of commercial calico." With this declaration of independence, Norm rose, and stretched himself to his splendid height and laughed. "I feel free—as free as this prairie wind."

"Yes, we are free," Nate echoed simply. Then both lapsed into silence. Norm moviug about amongst the little living things rapturously; looking to see that the chickens were all right, stroking the calf, and finally depositing the cat in her nest with her ever-present kittens, stroking her, petting her, as though she had been the one, tangible thing which had held him to his own. Then he turned back and the sight of Nate lying in apparent listlessness upon the grass near the shanty, seemed to change the tenor of his thoughts. His exaltation passed away, and something gripped his heart with a sense akin to fear. He scrutinized Nate's face, as he slumped down in a chair near him, and then he lapsed into thought—brooding, anxious thought, if the lines of his face meant anything.

Nate rose to go to his own place for the night. "Good night, old pal," he murmured quietly, and he cast a strange questioning look at Norm.

"Wait! Wait a minute, Nate," Norm spoke hurriedly. "Nate, if you want to go, if you want to sell out, and I can't help but think you do—we'll go. It was just the first thought of chance that unnerved me. I'm one of the kind that get into a rut, and haven't the force of character to get out. I've been thinking more, and there isn't any use to hang on to a piece of almost worthless—" Norm gulped a little as he choked out that traitor word—for what he termed "worthless" seemed just then to be of the highest possible value to him, for it represented to him, everything that had been worth while in all his young life. But he would be true to Nate, for Nate was of still greater value than any mere, material possession could be.

CHAPTER X.

The Grip of the Land.

"Don't get yourself wrought up any," Nate said affectionately, laying his hand on Norm's broad shoulder. "I don't want to sell any more than you do. I just wanted to be sure that you were not sacrificing yourself to please me."

"We've always felt about the same," Norm said, stopping between each word, as though something in his respiratory organs prevented speech. "The more I thought of selling, the worse it seemed to me. If we should sell—we might—drift apart."

"We'll anchor right here then," Nate asserted warmly, clasping Norm's big hand with both his strong, slender ones." We'll stay together, and we'll stay at HOME!"

The two boys walked silently to Nate's shack, and Nate threw his blanket down on the sod, and pillowless he lay down to rest.

"Pleasant dreams, kid," Norm said lightly, because his heart was too full, for anything more. He bent to tuck the blanket over Nate's chest, as he had done probably a thousand times before. He couldn't seem to give up the idea that Nate needed caring for, as he had in the days of their early pal-dom.

"I'm full of pleasant dreams awake," Nate answered, also lightly, but his heart was very full of tenderness for the great fellow who was now striding towards his own place.

"Norm," said Nate the next day," I'm wondering if that fellow, is as much interested in mud-pies, as he tried to make us believe. I would just like to know what he really wanted that soft shale for. They have clay put up on purpose for kids to model with—a good deal better and cleaner too, than this crude product."

"I'm sure Mr. Tibble told me, casually, that Mr. Measman had no children."

"The low-down, lying cur," Nate flamed. "He's got some idea about this land. He knows something that we don't," Nate paused thoughtfully. "Do you remember those troughs I tried to make out of that fine stuff at the base of the hill; they didn't work, but the bowl I made to warm chicken feed, that lasted a long time, and it got fierce hot sometimes too."

"He's bent on something," Norm admitted, thoughtfully. "I lay awake thinking a long time last night."

"I'm sure there isn't anything very valuable about this, it certainly is not gold or silver or mica, but maybe some common stuff that would prove useful. I'm going to find out what."

It was firmly fixed in the minds of both, that Mr. Measman had some ulterior motive in taking that box of shale, and that his nonchalance and apparent boredom were assumed for their benefit. It was not long before Nate had an errand to the cellar, and taking a light, he tried to lift out the stones which had lined his impromptu fireplace and baking pit, only to find that they were immovable. He scraped away all the coals and ashes, which had lain there so long, and placing the light in the bottom of the cavity, he discovered something that made his hands tremulous with excitement.

"Norm, come here," Nate called, and Norm came plunging down the cellar." What's the matter? Your voice souuds as though you had touched a lizard in the dark, or found a—"

Nate stood bending over the pit. Norm too bent closer and closer, then he, too, attempted to lift the lining tones. He struck a match and held it close to the bottom of the little, old, oven.

"It's hard as—"

"It certainly is," Nate agreed. "Maybe we'll get a crop off this land yet."

"Maybe," admitted Norm. "It has yielded some unexpected crops, and it looks as though here might be another.

"It's hoodooed for good," Nate said gaily. "I'm going to send a box of shale to my old boss," and straightaway he made and packed a small box and addressed it to his old employer, Mr. Rodman. He also sent him au explanatory letter, the first since he had left him five years previously.

HOME MADE ACETYLENE
Is not poisonous to breathe

The home paper will print your obituary in the next issue—if you ever "blow out the gas" when you visit your cousin in the city. But when your city cousin comes to your country home, he can blow out your acetylene gas light and it won't hurt him a bit to breathe it all night.

Your HOME-MADE ACETYLENE gas is much the best in many other respects. A hundred cubic feet of it will give you more light for your house and barn than a thousand feet of your cousin's city gas. Your light will also be far more brilliant and beautiful, and your acetylene cooking range will have every feature of the finest gas range used by the cities' millions.

To make acetylene for country home use you require an automatic generator. You simply feed this generator the gas producing stone, Union Carbide, about once a month — the machine does the rest.

The use of HOME MADE ACETYLENE has grown steadily while a hundred other competing light propositions have died by the wayside. Today we supply UNION CARBIDE to over a quarter of a million country home families.

Modern acetylene generators are wonderful improvements over the earlier kinds with which you may have been familiar. We will be very glad indeed to have you ask us any question that may come to your mind.

You will find our advertising literature intensely interesting. Address

Live Stock and Dairy

FARM STOCK BREEDING.

Sheep Breeding.

PART V.

TYPES OF SHEEP.—There are three distinct types of sheep; each type embraces two or more different breeds. Each type is suited to a certain environment under which it has been developed. Each has its place under our economic conditions to-day, and one of the first things the sheep breeder has to do is to choose the type and breed that he wishes to spend his time upon, and having chosen with care, the thing to do is to stick to that breed. The heavy wooled type has been reared under conditions of sparse and hilly pastures and hence stand grazing well. The fine wooled sheep are of a different form than are the mutton or medium wools. The typical fine wool form is of the same tri-wedge conformation that is so valuable an asset to the dairy animal. It may have other defects of body such as the ewe neck, and the animals are often "pot-bellied," and liable to have cat-hams. Because of the fact that the value of these sheep lies in their staple of wool and not so much in their carcasses, we can condone certain peculiarities of form which would be condemned in the strictly mutton sheep. The general class of fine wooled sheep is the Merino and of this type we have the American and Rambouillet. Increase the surface for wool growing and the possible weight of fleece has been increased. In the case of the fine wooled sheep, the surface for wool production has been increased by breeding for large folds of skin on the neck. These may be five or more in number on the American Merinos, and are called the "apron." The Rambouillets possess less folds of skin and a form more comparable to the mutton type.

There is another type of sheep which has been reared under the heavy lowland pasture conditions of the fertile regions of Great Britain. These sheep are much heavier, their wool is not so dense, though longer, and they are well suited for our lowland pastures. Despite the fact that these sheep have a longer fiber they cannot stand the rigors of a severe Winter so well as the fine-wools because their fleeces are not so dense; i. e., there are not so many fibers growing to the square inch. The wool hangs in ringlets and parts so that the skin of the sheep is exposed to the blasts of Winter and the rains may beat upon an unprotected spot. Exposure, to this class of sheep, means loss. Breeds of this type are the Lincoln, Cotswold and Leicester. The ideal body conformation is "cylindrical" with well joined neck and shoulders, broad, long loins with well developed hind quarters.

The medium wool types of sheep contain such well-known breeds as the Shropshire, Hampshire, Oxford, Southdown and Dorset. Under Central States conditions there is a large demand for sheep that will shear a good weight of fleece, and still give a good mutton carcass. Such conditions are met by these medium wooled breeds. The breeding of a superior medium wooled sheep is a much more painstaking job than to breed either the fine or long wools. In breeding stock it is a fairly easy thing to perpetuate one character such as color, the tri-wedge conformation, or the absence of horns, but when it comes to fixing two of these characters in one individual, the problem becomes more complex. So in breeding the medium wools, it is difficult to get the ideal mutton type well covered with a good quality of wool and perpetuate this through many generations without getting too far over one way or the other.

KEEPING RECORDS.—The most careful shepherds now are practicing a system of record keeping for their individuals, and it is said that these records are just as valuable in picking out the superior animal as are the records of other classes of live stock. It does not seem as though argument is needed to show that these records, when kept carefully and through three or four generations are very valuable. The sheep that will shear 10 to 12 pounds of wool is worth an appreciable amount more than one that will shear seven or eight pounds only. Say, for instance, that a record has been kept of the weights of the lambs borne by different ewes, the weight of fleece they sheared; also, the quality of the fleeces. While feeding will make some difference in the size of the lambs, size is an inherited character and so is quantity and quality of fleece. A sheep breeder in Canada has, through breeding, secured ewes, the bulk of whose offspring are either twins or triplets. Another advantage of keeping records, is that rams may be chosen for the quantity and quality of fleeces they can transmit together with weight of lambs and mutton conformation.

SELECTING THE RAM.—While there are some few flocks of sheep which belong to the strictly wool or mutton types, the big demand is for sheep that produce a medium weight of fleece, and at the same time, the lambs and adults make good mutton. This demand has forced the medium wools into prominence and so we will deal with the choice of a ram from this class, only. The ram should have an open, yet not vicious eye. A good supply of energy is needed, but excess energy is likely to vent itself upon the attendant. The color of the inside of the eyelid is a good indicator as to his internal condition. A rosy pink color is a sign of health, but beware of a pale blue tint. Something is wrong and this is often the presence of stomach worms or intestinal parasites. The muzzle should be fitted with good open nostrils and strong jaws. A good girth around the body behind the forelegs (called the crops), taken together with open nostrils indicate strong breathing apparatus, and since large quantities of oxygen are needed in order to oxidize the food which is burned in the body, these are essential. Another noticeable defect in lots of Chicago lambs is that they are ewe-necked. This knocks off a little in the price which is paid for them and so the ram should have a neck blending well with the shoulders. In selecting the ram remember that the greatest value of the sheep's carcass lies in the loin and hind-quarters. These are inheritable qualities, so the ram should have a long, well-fleshed loin with well muscled hind-quarters if his get are to "top the market." A discriminating market will pay more for a carload of such lambs than for a carload of cat-hammed individuals. The qualities of fleece which we look for in a ram of the medium wool class are the same as those which are to be encouraged in the ewes and these are given below.

REQUISITES OF A GOOD FLEECE.—The character of the wool covering the sheep, together with its density, will be the determining factors which will influence the price paid for the product. Some sheep have a good quality of fiber, but on account of its sparseness on the body, they are unprofitable and not amply protected from the elements. On the other hand, the fiber may be dense yet the character of the wool is such that the value is materially decreased. The way to remedy these conditions is through selection. The medium wool fleece should, in general, be from two to 2½ inches long at shearing time. To examine the fleece, lean over the animal and part the wool on the opposite side, never on the back. The righteous indignation of a showman can easily be excited by parting the wool of his sheep on their backs. This makes an entrance for dirt and rain. Part the wool on the side. Note the amount of oil (yolk), the length and crimp of fiber and its density. These are the things which demand special notice. The yolk is necessary in order to preserve the wool and is also very effective in keeping dirt and foreign matter out of the fleece. It is also a protection against cold weather. Long fibers add to the weight, while the density (number of fibers growing to the square inch) often makes the difference between a seven or eight-pound fleece and an 11 or 12-pound fleece.

Another point which should be noticed is the covering. Some breeds have open faces while others have well wooled faces and legs. This of course, must be suited to the breed one is keeping, but it is a fact that sheep well wooled on the face, under side of the body, and well down on the legs, are better protected from the weather. The wool covering these parts is just as valuable as that on the back and in a flock of 50 sheep makes quite a difference in the weight of fleece. The most noticeable defect of the farm flocks of this country is the absence of wool on these parts, and it could be very easily remedied by selecting rams well covered. While the sheep breeder must be careful not to over-emphasize the fleece to the detriment of the mutton conformation, yet it will bear improvement without deteriorating from the mutton value of the carcass.

AVOID DISEASES AND PARASITES.—There are many diseases which attack sheep. Some of them may be passed on through pasturing upon infected soil. Others may be controlled by prevention rather than cure and still others are controlled only by the judicious use of the knife or ax. When a disease takes hold of a robust sheep, a fight commences—a fight between the white blood corpuscles of the animal body and the disease germs. The feed is a total loss. Precautions against disease are worth infinitely more than barrels of sheep remedies. It is more economical to apply a stock dip than to feed ticks. It takes feed to make the tissue food which is carried throughout the body by the blood, and if ticks suck blood, they suck food, hence it costs money to keep them. The sheep breeder, especially he who breeds the medium wooled types must use extra precautions in his selection of stock to see that he does not lean too far toward the wool conformation and still retains a well-fleshed mutton carcass. These are inheritable characteristics and cannot be altered to a marked extent by feeding. They must come through mating of high-class individuals. Then, after obtaining such superior animals, keep them clean and free from parasites and diseases.

LIVE STOCK NOTES AND PRICES.

More Sheep for Ohio.

"SHEEP should be raised on every farm in Ohio." The University gives this advice. Sheep husbandry in the State has two distinct drawbacks, stomach worms and dogs. The fence used by the United States Forest Service in protecting sheep from coyotes is recommended. This fence is built as follows: A strand of barbed wire is stapled to posts at the surface of the ground; three inches above this is placed a 36-inch strip of closely-woven wire fencing, and above this two strands barbed wire. If sheep free from stomach worms are secured, little trouble will be caused by these pests. The worms are small whitish worms that infest the stomachs of the sheep. The lambs become infested by eating grass on which the young worms have crawled. It is recommended that lambs be placed on pasture which has not been occupied by mature sheep. It is advised that 25 or 30 ewes should be found on every Ohio farm. A flock of this size may be kept at small expense, it will clean the farm of weeds, provide a supply of wholesome food, and return to farmer a neat sum from the

A FARM FLOCK LACKING UNIFORMITY.

wool produced. The best roughage for sheep is clover or Alfalfa hay and a few roots. If clover is not available corn fodder supplemented with a little bran or linseed meal is sufficient. When lambs are old enough to eat, give them a little cracked corn where the ewes cannot get it. A small flock of ewes may be pastured during Winter on a wheat or rye field.

Land in Barron County, Wisconsin, has risen in 15 years from $20 to $100 an acre, due to keeping cows, and better cows each year.

THE Nebraska Experiment Station has recently found that cows calving in September and October average 785 pounds more milk than those freshening in April and May.

Two tons of Alfalfa hay contain as much feeding value as 110 bushels of oats. One acre of land produces the Alfalfa, while three acres are required to grow the oats. It costs $8.26 to grow the Alfalfa and $21.03 to grow the oats.

A farmer in Michigan has discontinued the apartment hoghouse. He is using the individual hoghouse, and since the change, he has not had a sick animal. He scatters air-slaked lime wherever the hogs sleep or frequent out of doors, and frequently supplies dry bedding.

Doctor Lowry of Lawrence County, Ohio, claims a world champion grade as producer of heifer calves. Four heifers in 10 months and all are doing well. The cow is a grade Brown Swiss, and the calves by the first service are from Jersey bull, and the second service, from a Holstein.

Oct. 18. Alfalfa, which is the main money crop, $4.50 in the stack. Butterfat, highest, 32½; lowest last Summer, 22. Beef, on foot, 5½ to 6; hogs 8 to 10; eggs 40, have been as low as 20. Potatoes $25 to $30 per ton. Milch cows from $60 to $200. Veal 11 to 12, dressed. Money scarce. C. B. R.

Fallon, Nev.

Oct. 27. As I am situated within nine miles of St. Louis we get close to the retail prices for garden and truck crops. Last year when potatoes were quoted at 75 to 80 cents a bushel in St. Louis we received one dollar delivered to families in five and 10-bushel lots; tomatoes and other things in proportion. We sell our milk at home from six to 10 cents a quart; do not have any cattle except milch cows. E. B. O.

Belleville, Ill.

RELIEF FOR CHOKING COW.—The following is a sure cure for a cow with an apple in the throat. Melt one pint of lard and drench the cow. I will guarantee the apple will go up or down in a minute or two. This is a simple remedy, but sure. H. L. M.

THE GASOLINE ENGINE ON THE FARM. Its operation, repair and uses. By Xeno W. Putnam.

This is the kind of a book every farmer will appreciate and every farm home ought to have. Includes selecting the most suitable engine for farm work, its most convenient and effeient installation, with chapters on troubles, their remedies, and how to avoid them. The care and management of the farm tractor in plowing, harrowing, harvesting and road grading are fully covered; also plain directions are given for handling the tractor on the road. 530 pages. Nearly 180 engravings.

This book will be sent to any address prepaid for

Hindrances to Raising Purebreds.

ONE of the greatest hindrances to keeping purebred stock is that the common lot of farmers keep scrub bulls and let them run with the cows. We have a farm, something over a hundred acres, which is nearly a mile long. Joining us are seven other farms; two of them are rented and one to a dealer in stock. We are gradually changing our herd of grades to purebreds. We began by purchasing a grandson of King Segis and two fine cows of other strains from which we have two calves. In that time we lost the chance for two more through scrub bulls from our neighbors' fields, with all our watchfulness and care.

A man remarked in my presence: "I was not much interested in stock until I was given a purebred bull if I would keep it stabled." In this little section there is but one kept stabled. The cry is "It costs too much and is extra work." The one farmer in this section who keeps his stabled—though his is only a fine grade—says he likes it so much better than running after him and mending fences. What we need is a law that will forbid turning them loose. Some things farmers as well as other people have to learn by compulsion, which, when they have learned, they are glad of. D. S. M.

Cost of a Heifer.

ON page 1226 is an article entitled "The Cost of a Heifer." From a scientific point of view, that may be true, and no doubt is, but to get right down to "brass tacks," and the ordinary farmer's way of doing it, the reading would be more like this: Calf dropped May 3, 1913:

Cost of calf	$2.00
270 quarts skim-milk at 2c. per qt.	5.40
Four and one-half bags calf meal	4.50
One bag ground oats	1.30
Vegetables (small potatoes, pumpkins, etc.)	2.00
One-half ton hay at $12 per ton	6.00
Pasturing, including breeding	3.00
Total	$24.20

We make no account of manure, taking that for labor. These figures are from May 3, 1913, to October 10, 1914, as taken from our farm accounts. This heifer is a grade Jersey, and gives every promise of being a good one, due to freshen April 15, 1915.

If the figures in the article referred to are correct is it any wonder beef is high?

Maine. G. A. W.

Ayrshires Come Back.

THERE has been some little argument as to whether a dairy cow can make a good showing in tests year after year. Some argue that a cow will make one great effort and then fall off—unable to repeat. This was not so with the Ayrshire cow Crimson Rambler 21109 A. R. 61. This cow has made seven consecutive yearly tests. The first began as a two-year-old August 22, 1906; the seventh closed Sept. 24, 1914. Here is her record:

	Lbs. Milk	Lbs. Fat	Lbs. Butter	Average % Fat
Two-year-old class	7,988	277.56	327	3.47
Three-year-old class	8,001	305.21	359	3.81
Four-year-old class	9,036	329.91	388	3.69
Mature class	10,346	383.61	451	3.71
Mature class	12,776	433.95	511	3.4
Mature cass	11,299	393.79	463	3.49
Mature class	11,509	401.91	473	3.49
	70,955	2,525.94	2,972	3.58

This is surely a continuous performance that would delight a milkman. As we figure it this milk would fill a pan 10x15 feet and 6½ feet deep!

Otsego County Dairy Conditions.

Generally considered more than average crops have been harvested. Most silos were filled. Heavy disposals of surplus stock were made last year so farmers are not anxious to sell good milch cows unless more tempting prices are offered than dealers who have lately visited this section are inclined to pay. One man recently sold a mixed dairy of ordinary cows at $35 per head, but selected cows readily bring $50 to $75 each. Dealers have scoured the country for Fall and early Winter springers but farmers set their figures at close margins, so comparatively few are sold. Desirable heifers, springers, are valued at $35 to $50. A dealer asked one of our farmers: "Have you any good cows?" "Yes," replied the farmer, "I have." The dealer next asked: "Do you want to sell some of your good cows?" "I want to keep good cows myself," returned the farmer, who thus expressed a prevailing sentiment. However, fancy prices would still call good cows into market. Shippers have no demand for farrow cows or strippers. Fat beeves are in good demand, but sell more profitably to local meat cutters than in New York markets. Veal calves are high, so many farmers prepare them for market. Interest in dairy butter making is increasing. There is a steady call for dairy butter, which is retailing at 34 cents. Many farmers living at a distance from creamery or station find home manufacture far more profitable than selling the raw product. Borden quotations are dominant here. Several independent creameries follow the Borden schedule. The flat price for the present six month contract is the same as for the corresponding season last year: October, $1.70; November, $1.80; December, $1.80; January, $1.75; February, $1.65; March, $1.60 per cwt. Acceptable score of barn and methods adds 10 cents per cwt., and a butter fat test of 3.8 or better adds 10 cents more per cwt. The local company supplying milk to Oneonta gives better returns, as does also the Sheffield-Farms-Slawson-Decker Co. The latter company is erecting buildings for a new plant at West End, Oneonta. This concern is to open April 1. High standards are required to secure the maximum rates offered by the Sheffield Co., but it is not extra requirements that farmers resent. They do object to the injustice of the consumer in expecting a superior product to be furnished without adequate compensation for extra labor and expense. A lively interest in purebred cattle is gaining throughout the county. Some of our dairymen have an enviable reputation for their purebred herds. C. M.

TESTING CREAM.—An editorial on page 1266 calls attention to the constant friction which is going on between buyers and sellers of milk. The same trouble is constantly present with cream sellers, too. Not long ago an experienced creamery man told me of a "kink" whereby the creameries can keep the test lower than it should be and yet escape detection by their patrons—even those who have a Babcock tester. This is by *measuring* the sample to be tested instead of *weighing* it. Now the richer the cream the lighter it is—or expressed differently, the more bulky it is—consequently a measured sample of high-test cream will necessarily contain less butter fat than a weighed sample. The beauty of this system lies in the fact that nearly all farm testing is done by measuring the sample. Several of the more progressive dairy States have laws requiring the use of weighed samples, but these laws are not always complied with; and in States which have no such laws very little testing by weight is done. Does your creamery measure or weigh the cream samples? Find out and insist on a weighed sample; it means dollars in your pocket. MAURICE FLOYD.

Something Worth Looking Into

A Holstein Bull Calf

of exceptional quality individually. His sire a good son of Pontiac Korndyke (sire of 116 A. R. O. daughters, 11 over 30 lbs. No other sire has as many) out of a three-year-old dam who made over 20 lbs. butter 7 days. This calf's dam is a magnificent cow with 21.7 lb. butter 7 days to her credit, A. R. O. and over 19,000 lbs. milk 1 year (unofficial). Her sire has 9 A. R. O. daughters (2 sons) 4 over 20 lbs. butter 7 days. He is a brother to the sire of Paul Beets De Kol—106 A. R. O. daughters, 2 over 30 lbs. Also of Aaggie Cornucopia Pauline, 34.32. May Hartog Pauline, 29. Price, $125 for a quick sale. F. C. BIGGS, Trumansburg, N. Y.

Purebred Registered

HOLSTEIN CATTLE

British Holstein butter gained highest honors at the last dairy show of the Royal Dublin Society in Ireland. In addition to taking the prizes in special classes, this butter won for its producers a gold medal awarded for the best butter in the show. It is sometimes ignorantly asserted that the Holstein is a poor butter cow, in the face of the fact that the world's records for butter production for all periods of official testing (except the 365 day) are held by purebred registered Holstein cows, and the year's record was exceeded by only one cow of another herd.

FEEDING PROBLEMS

Dairy Ration With Alfalfa.

WILL you balance a ration for cows averaging 1000 pounds in weight, giving from 20 to 40 pounds milk a day? My roughage consist of good silage and first-cutting Alfalfa hay of good quality, also have a lot of corn fodder which I would like to feed without affecting the milk flow. For grain I can get dry brewers' grains at $30 per ton, bran $35, dried beet pulp $28, cornmeal $35, gluten $33, oil meal $40 and cottonseed meal $32 per ton. Is it safe to feed Alfalfa hay right after a cow freshens, as this is my first year with Alfalfa?
Connecticut. P. J. C.

I would recommend feeding the corn fodder during the Fall and early Winter, as it gets less palatable and not so easily digested with age. I think I should feed Alfalfa in the morning, corn fodder at noon, and silage at night, after milking. The order, however, is mainly a matter of convenience. Scatter on the silage two pounds each of brewers' dried grains, cottonseed meal and cornmeal. With the Alfalfa and silage feed what the cows will clean up readily. They will probably leave some of the coarser corn stalks, unless the corn is of a small variety. When the corn fodder is gone, feed silage twice daily, 15 to 18 pounds per cow at a feeding with Alfalfa once a day. Feed grain on silage, about four to six pounds daily. There is no danger in feeding Alfalfa hay to a fresh cow if she has had it before freshening.
C. L. M.

Feeding a Work Team.

WOULD you give me a balanced feed for heavy team horses? At present I am feeding six quarts oats and all the hay they will eat per horse; in all 12 quarts of oats besides plenty of good hay, bran mash at times also. The above for two horses. S. J.

It is a mistake to give work horses all the hay they will eat. If allowed free access to well-cured hay, work horses will consume an enormous amount of hay, which is not only expensive but responsible for digestive troubles, and even heaves. A safe rule is to feed 1¼ pounds of grain for each 100 pounds of live weight of the animal, and one pound of hay for each 100 pounds live weight of the animal. It is assumed in this case that the horses are doing average work. In case the work is more strenuous, increase the grain ration, but the quantity of the hay should be substantially the same. The bulk of the hay should be fed at night. In case the animal was receiving 10 pounds of hay per day, three pounds in the morning, and seven pounds at night would be the most satisfactory division of this quantity. The major portion of the grain should be fed at noon, as the animal needs concentrated feed at this time of the day in case he is to work with ease during the balance of the day. To start horses at work in the morning filled to the brim with hay or to repeat this practice at noon, is a system of feeding that is not found in stables where the horses are maintained in the best physical condition and fed with the greatest economy. An excellent grain mixture to be fed at this season of the year would be as follows: 300 pounds oats, 200 pounds shelled or cracked corn, 100 pounds wheat bran.

If the animals are then in flesh the amount could be increased, and it would be well if the animals are out of condition and their coats are not in a fine silky condition to add a small amount of oil meal to the feed daily.

Salt should be available at all times but should not be mixed with the feed. The use of clover or Alfalfa hay makes it possible to get along with a smaller amount of grain. Straight Timothy hay serves its best purpose when fed to work or driving horses. If the animals are doing extra heavy work, it is necessary to increase the amount of grain. On the other hand, it is just as essential to cut the grain ration in half during idle days or holidays. A serious condition exists where animals are fed the same amount of grain and hay each day, regardless of the amount of work that they are performing. F. C. MINKLER.

Ration for Milch Cow.

WILL you give me a ration for a cow now giving about 14 quarts daily? She is due to freshen about next March. We have cornstalks—sweet corn with some ears on mangels, small potatoes, carrots, bran, gluten, oil meal, in fact all sorts of grain, ground and unground. Our stalks, mangels, etc., are grown on the place, while the grains and their products we have to buy. I want to feed cheaply as possible. We also have to buy hay. Would there be any advantage in cutting stalks up like silage? We have a machine which will do that. G. A. C.

A suitable grain mixture for dairy cows with the available feeds as suggested would be as follows: Gluten, 100 pounds; bran 50 pounds; cornmeal 400 pounds; cottonseed meal 100.

A cow giving 30 pounds of 4% milk should be given 7½ pounds of this mixture daily. In addition she should be given what corn fodder she would clean up with relish, and providing the cost of cutting or shredding the fodder was not excessive it would pay well for the labor involved. There is nothing that makes any better bedding for cows than cut cornstalks, and they will pick over the litter much more carefully provided it is shredded. It is assumed that the sweet corn fodder is in the shock, and this may be fed on the same basis as the corn fodder suggested above. Succulence should be provided, by means of mangel-wurzels and carrots, a reasonable amount being a pound of the mangel-wurzels for each pound of milk produced. In this case 30 pounds of mangel-wurzels would supply an abundance of succulence. There is very little feeding value in small potatoes, yet in the absence of succulence as supplied by corn silage or mangel-wurzels, potatoes do increase the flow of milk. They would serve a better purpose in case they were cooked and fed to swine. It would be possible to get along without the use of any hay, in case there was an abundance of corn fodder or sweet corn stalks. In case the supply is limited, it might be well to feed from five to seven pounds of clover or Alfalfa hay per day in addition to the stalks. F. C. MINKLER.
N. J. Experiment Station.

Feeding Sheaf Oats.

WHICH will pay me better—to chop unthrashed oats into two-inch pieces for feeding, or thrash and feed with the long straw? D. S. K.

You do not say what kind of stock the oats are to be fed to, but we presume you will give them to horses. The plan you mention will answer, provided you know how much grain you are giving when you feed the oats. The great trouble in feeding grain of this kind either in the bundle or when chopped up, or in feeding corn without husking, is that unless we thrash out several bundles of the oats we do not know how much grain the stock receives, and we are liable to feed too much or not enough. If you can tell just how much grain a feed of this chopped oats will give, and how much meal you want to add, the plan will work reasonably well, and the horses will probably eat more of the chopped straw than they would if the whole straw was fed them.

Oats for the Calf.

WE had a very peculiar experience with a calf this season. Calf was dropped June 22, and when three days old was taken from the cow, and put on skim-milk, and calf food. It began to scour very badly. We cut out the calf food, and scalded the milk. No improvement. It grew worse if anything. Then we tried hay tea, whole milk, and all sorts of combinations, adding flour and feeding raw eggs, until the poor thing got so weak it could hardly stand, and as a last resort some one suggested rolled oats, made into a porridge. I tried it on a small quantity, made quite thin (about this time could not get any more milk). The calf began to gain, and ceased to scour. As soon as I could, I got more milk and thinned the gruel with it, and the calf would not eat it! From that time, it has not had a drop of milk, and is doing finely. I have fed about one pint of oats to a feed, feeding three times a day. At present I am not feeding quite so much oats, but am giving it at noon, a feed of vegetables, such as pumpkins, squash and small potatoes. I have had the calf hitched out every day on grass, and now it eats anything. The last of this month I shall feed ground oats dry, about a pint to a feed. This is our fourth calf (raised by hand). We lost one last Spring from the scours, which we might have saved if we had fed oats. I. S. C.

AILING ANIMALS.

Indigestion.

I HAVE a horse that coughs up a whitish, slimy fluid, and will not eat when in this condition. Sometimes it is so severe that it resembles vomiting. It has been relieved by dosing with aromatic spirits of ammonia, and does not appear again for a couple of weeks. I am told that it is catarrh of the stomach. Do you think it can be permanently cured? What would you suggest to feed, also prescribe? E. L. H.

The substance referred to probably is chyme from the stomach, and the horse will need more careful feeding. Possibly he bolts his feed without perfect mastication. Feed from a very large box so that the grain will spread out thin on the bottom. You might also mix a few hard peas with the oats to induce chewing. Slightly acidulate the drinking water with dilute hydrochloric acid.

Suppurating Corn.

WHAT can I do for a horse that got gravel in his foot? He became very lame. The blacksmith shod him and put tar and oakum in the foot and a leather under the shoe, said if not better to cut out leather and soak out foot. Is that right? C. E. C.

Horses do not suffer from gravel in the foot. That is a misnomer by the blacksmith for a corn which has come from bruising by the shoe or some such cause, with formation of pus which softens and under-runs the sole. After the affected part has softened and opened gravel or dirt might possibly work in, but not before. The right treatment is to cut away all loose and under-run sole and wall, to expose the diseased tissues, then scrape these and cauterize with a saturated solution of corrosive sublimate, after which cover the parts with a mixture of one dram of iodoform and seven parts of boric acid, absorbent cotton and bandages. The dressing should be renewed once daily. The operation should be performed by a graduate veterinarian.

Mare With Heaves.

I HAVE a mare with heaves; can do light work, good roader. I would like to breed her as she is sound otherwise. Would Fowler's solution or any other heaves remedies be dangerous to give mare in foal? She is on grass now and not working. L. S. M.
New York.

It is a mistake to breed from an unsound mare. The tendency to heaves by many is considered hereditary. That is our belief as we have known many cases in corroboration. All heavy horses have gluttonous appetites and the appetite is hereditary and induces heaves, if much bulky, or dusty, coarse, innutritious fodder is allowed just before working. Fowler's solution, as often prescribed here for heaves, may safely be given in correct doses to a mare in foal.

Obstructed Teat.

A JERSEY cow is a very hard milker. The veterinarian says the milk duct is thick from the udder to the end of teat, and there is no cure. What is your advice? J. Y. H.
Pennsylvania.

Where the entire milk duct is obstructed by thickening its lining membrane the only hope of improvement will come from the daily insertion of sterilized teat plugs, or dilators, which may be ordered through your druggist or veterinarian, from a dealer in veterinary instruments. Were the obstruction merely at the tip of the teat it might be operated upon successfully by means of a teat bistoury.

Lame Calves.

I HAVE some calves that seem to be lame. The trouble seems to be in the hoof. There is a dent in the hoof and it seems to be longer than normal. The calves are healthy and strong, eat well and are in good condition. They are out to pasture in an orchard. When they are feeding they go on their knees.
New York. B. W. B.

Confine the calves to a roomy, airy, well-bedded box stall in a clean stable. Poultice the hoofs with hot flaxseed meal until the calves can stand; then cover them with oakum saturated in a five per cent. solution of coal tar disinfectant and kept in place with bandages. If there is loose or under-run horn on the hoofs it should be cut off before starting the treatment.

Horse With Worms.

A HORSE affected with worms has been out in pasture nearly all the time, and as this pasture is largely marsh grass it is possibly not good for him. Would I better discontinue the pasturing? In advising treatment you say "starve horse at least 12 hours before giving oil and turpentine, then mix sulphur and iron with feed 24 hours afterward. Do you mean that he should have *no food* for 24 hours after taking oil and turpentine or simply that I begin to use the sulphur and iron 24 hours after the oil and turpentine? Would cornstalks do in place of hay and whole corn in place of oats and bran? I have plenty of corn and stalks. W. E. F.
New York.

When a horse has worms he should not pasture on marsh land. The worms are acquired there. Cornstalks are also thought likely to infest a horse with worms. We have no actual evidence to that effect, however, and the corn fodder may safely be used in place of some of the hay. Starve the horse before giving the turpentine and raw linseed oil, and let him have his feed afterward. Start giving the powders 24 hours or so after the oil has been administered. A. S. A.

The General says:-

Black Wall Map of the World

The World and the United States At A Glance

A Great Education

At Your Fingers' Tips

This beautiful Wall Map, size 25x39 inches. On one side we have a complete, up-to-the-minute map of the United States in bright colors, showing the Capitols, Railroads, Rivers, large cities, etc. It also shows portraits of our 27 Presidents, and gives their biographies.

On the reverse side we have a map of the world, printed in a deep, ebony black. White and colored lines differentiate countries, rivers, lakes, cities and mountains. You never saw a map as black, as beautiful, as wonderfully enlightening as this map of the world. From this you may in a single day learn more than you could in a year's study of books.

Contrasting with the ebony black of the map are the flags and the coat-of-arms of all nations, in their flashy, exquisite colors. Our own seventeen flags are here in beautiful, bright colors—did you know that the United States had seventeen different flags?

And then, there's that wonderful Bible information. How many books, chapters, verses, words, letters does the Bible contain? How many books are classified as History, Poetry, Law, Prophecy, Epistles? Which books are exactly alike? How many times is the name of our Saviour mentioned? In how many languages is our Bible published?

Wouldn't you want to know these things? And wouldn't you want to know the many, many other things this marvelous Map of Knowledge possesses?

The Map will be sent, postpaid, for One New Yearly Subscription, or Twenty 10-Week Trial Subscriptions, or Two Yearly Renewal Subscriptions.
The Rural New-Yorker, 333 West 30th St., N. Y.

CONTAGIOUS FOOT-AND-MOUTH DISEASE.

THIS malady, which unfortunately is prevalent at the present time, is the most infectious disease affecting cloven-footed animals. It does not ordinarily cause death, the percentage of loss not exceeding 0.02 to 0.05 in the most unfavorable circumstances and conditions, but it leads to great financial losses in that it prevents cattle from thriving, induces serious suppression of milk, may cause abortion, and being so infectious necessitates strict quarantine, and restriction of marketing of live animals and milk. It is virulent for cattle and also attacks sheep, swine and goats. Man may be affected by drinking raw milk of an affected animal, but milk is perfectly safe if boiled or if pasteurized to 140 degrees. The disease is quite rare in man.

Contagious foot-and-mouth disease also is known as "contagious aphtha" and is caused by a virus so minute that it never has been seen by the strongest microscope, and passes through a porous filter of porcelain. It therefore is technically termed an "ultra-microscopic" or filterable virus. The virus in its pure state is found in vesicles (blisters) which appear upon the lining membranes of the mouth and tongue and upon the teats and skin of the feet. The vesicles rupture and the fluid they contain may contaminate the milk, or spread the disease to other animals upon pasture, litter, feed, and through the medium of the milk. Hogs generally become affected through the drinking of milk, whey or buttermilk. The disease makes its appearance in from one to five days, after exposure; in rare cases it may remain dormant for 11 days. The attacked animal first shows fever, lack of appetite and drooling of saliva; then the vesicles appear and fever abates. The vesicles rupture in from one to three days, forming raw sores which scab over and gradually heal in from two to three weeks from the time of the attack.

Smacking of the tongue is a characteristic symptom of the disease. Animals become quite lame when the feet are severely attacked. Sheep suffer the most in this way. Hogs also have the foot lesions, but may show vesicles upon the snout. It is possible for horses to be attacked, but that seldom or never occurs.

The virus of the disease always comes from a pre-existing outbreak of the disease and is conveyed in hides, hair, wool, horns, hoofs, litter, feed, and on the boots and clothing of persons. It may also be carried from farm to farm by vermin, dogs, birds and in the air, when dried vesicles powder and blow away. In at least one outbreak in this country it was caused by imported vaccine against smallpox. The disease always is present in some foreign country, hence the enforced quarantine of 60 days upon all cloven-footed animals coming to us from abroad.

While the disease usually runs a mild or benign course and the afflicted animal finally makes a complete recovery, it is not left immune to a second or third attack. Immunity is slight and a cow has been known to suffer three attacks in one year. For these reasons, the extreme infectiousness of the disease and the great economical losses entailed by its rapid spread, the only right way of dealing with an outbreak is instantly to kill all diseased and exposed cloven-footed animals and bury the carcasses deeply in quicklime. Thus the disease is "stamped out" immediately. At the same time the strictest possible quarantine has to be maintained as regards the infected farms, premises and districts and all movement in animals, except for immediate slaughter, has to be stopped by law until the disease has been controlled and all infected places have been thoroughly cleansed and disinfected. These are the control measures at present being enforced by the Bureau of Animal Industry of the Federal Government and the State authorities are joining in their enforcement.

The disease spreads most rapidly in hot weather. Winter weather may retard its spread. Heat quickly kills the virus. Disinfectants also are promptly destructive to the virus, a five per cent. solution of carbolic acid, or compound cresol, or formaldehyde being quickly effective. After cleansing and the free application of such a disinfectant freshmade lime wash should be applied by means of a spray and also used to flood contaminated floors. The pens for cattle, sheep and hogs at the great stockyards of Chicago and other cities are being made sanitary in this way at the present time. When these measures have been enforced quarantine will be raised and marketing resumed. Meanwhile the International Live Stock Exposition which was to be held Nov. 28 to December 6 at Chicago, has been "called off"; but we understand that the exposed and affected cattle of the National Dairy Show at Chicago are under treatment in strict quarantine and will not be slaughtered.

A. S. ALEXANDER, M. D. C.

NEW ENGLAND MILK CONDITIONS.

THERE are at present, in some cases, hazy ideas in regard to the milk zones of New England and how they affect the present milk supply in regard to prices, freight charges, etc. Under the former system of transportation of milk, when the leased car system was used altogether, the freight per car varied according to distance from Boston; that is, a charge of six cents per can was the figure which the contractors charged in sections 17 to 23 miles from Boston, seven cents per can from 23 to 36 miles sections and so on the width of each zone increased as the distance from Boston increased, up to the middle or nine-cent zone, which was 20 miles in width; from this on one cent for every 20 miles was added. These charges were not the actual freight cost, but other charges of expense were reckoned in also to make the cost come up to the official charge of six, seven, nine or whatever the charge might be per zone. The contractor paid so much per year per mile in actual freight per car which would carry a certain amount, usually averaging about 700 8½-quart cans. If more than that amount was carried a greater profit of course amounted to the leasing contractor; if less of course a reduction in profit was the result. The real cost of transportation was usually less than the amount allowed to each zone, be it seven, eight, nine or more, and these other charges made by the contractors make up the difference and render them a profit above actual freight cost. Many schemes of all sorts were thought up to make a little extra profit in all lines of milk handling, which might be a small fraction of a cent per can, yet counted up to large sums in the aggregate.

This system still goes in most cases on milk bought outside this State, but in this State the contractor cannot lease the car, but must pay a certain charge per can, and the railroad mans and runs the cars, and must take any person's milk, whether he send one can or one hundred or more at the same rate per can. If the amount of milk altogether offered on a railroad line is not enough to furnish a regular milk car then the baggage car is used, and these small amounts are not iced as the rule. Formerly the price offered by contractors was for the middle or nine-cent zone, and was one cent per can more in the eight-cent, two cents per can more in the seven-cent, three cents per can more in the six-cent, one cent per can less in the 10-cent, and two cents less in the next further away and so on up to certain distance beyond which the price did not decrease any more, but remained the same.

Now the announced price is for the middle zone section just the same, but does not apply to Massachusetts; that is, at the present time what would be the six-cent zone in Massachusetts is paid no more than the nine-cent zone in New Hampshire. The price paid the former in both is nearly the same, in fact some contractors are paying more in the nine-cent zone in New Hampshire than they pay for the milk they buy in Massachusetts in the old six and seven-cent zones. An illustration of this is as follows: D. Whiting & Sons are reported as paying at Lyndeboro, N. H., 41 and 42 cents per can, distance from Boston being something like 100 miles. In a certain section of Westboro, Mass., about 30 miles from Boston, the C. Brigham Co., one of the Whiting controlled companies, pays about 39 cents per can average price for this Winter's milk. About 70 carloads of milk per day are shipped into the metropolitan district of Boston, 40 in Boston proper; nearly all of this comes from outside Massachusetts.

Ten years ago there were many creameries in Maine, New Hampshire and Vermont, making cheese and butter; now Maine has only two, New Hampshire seven, and Vermont 218 making these products, the rest or over 55 per cent. are shipping milk or cream to Boston. Furthermore, a large share of these are owned or controlled by Boston contractors. It is stated that the Hood people have obtained 25 in Vermont alone since last April, so if their regular supply is withheld or kept out of Boston at any time they can at once obtain a large supply from this source. A study of the above fact proves the only hope of bettering the situation is to coöperate and work with the consumer on a general plan of mutual benefit to both, to produce a product acceptable and satisfactory in all ways possible for the consumer, who will in his turn pay a reasonable price to the producer for the same. To bring this about and cut the cost of transportation and delivery, especially the latter, to a much lower figure than it costs at present, to work along these or similar lines, is the only thing to do, and wise heads are so deciding.

A. E. P.

CONTROLLING BREACHY CATTLE.—I have seen many appliances used, from a heavy pole 10 or 12 feet long tied to a cow's neck, to a rope tying the head to the front foot, but everything I had seen was detrimental to thrift, so I resorted to the following: From a bending factory I got a bob-sleigh runner and dressed it down to the size of a fork handle at the back end, and twice as large at the front; put a staple and ring just at the curve on the outer side and another about two feet back of it, then a strap around the neck through the ring, and a surcingle around the body, just back of the front legs, and through the other ring. The curved heavy end would hang down, and as the cow put her head down to eat or drink it would touch the ground and lop over out of the way, and it did not interfere with eating or lying down, but if she went to a fence it would hit it and surprise her. I never used it on an animal more than a few days before they would give up trying to jump. I loaned it many times and it gave satisfaction in every case, and I think there is nothing more humane or effectual.

E. M. RUSSELL.

Virginia.

Dairymen and Breeders' Meeting.

THE annual meetings of N. Y. State Dairymen's Association and N. Y. State Breeders' Associations will be held at Rochester N. Y., December 15-18. An excellent programme of addresses and exhibits has been prepared. Butter and cheese will be manufactured and a sale of purebred cattle held in connection with the meeting.

This is the great annual gathering of New York live stock men and should attract a large attendance, especially of the younger element.

The secretary of the Association is W. E. Griffith, Madrid, N. Y.

Nov. 9. Fine weather and health good; corn husking has commenced and new corn is coming into the market. Several killing frosts here of late; ideal weather for the farmer; pastures good; stock in fine condition; young Alfalfa looks good. A large acreage of wheat and rye was put out and is looking fine. Late potatoes generally of large size and yielding well. The sorghum crop was good. Hogs selling $6 to $6.50; fowls, 9; eggs, 27; butter, 17 to 24; turkeys, 12; ducks, 8; geese, 6; corn, 50; wheat, $1.02; potatoes, 50. Good work horses and mules in fair demand.

:: "The Favorite Hens" ::

Six of Them At Work

THE 30 favorite hens reached the Connecticut Agricultural College promptly and safely. By Saturday night at the end of October, they were all comfortably housed in their new quarters, where they proceeded to get acquainted and adapt themselves to the new situation. As is the case when hens or human beings are brought together from the corners of the country to live as a community for a year, leaders or bosses must first be selected. Civilized human beings have been taught to run such things by the majority rule and they settle the matter by ballot, or perhaps it might be said by wire pulling in a caucus. Having settled these matters, the majority of humans settle down to work and proceed to business. The 30 hens seemed to follow a rather different plan. When 10 of them were put together, strangers out of 10 different flocks, they proceeded to scrap and fight each other until the boss was finally selected in this way. In each of these pens therefore there are two or three hens that seem to have established their right to stand by the feed dish or the water fountain whenever they see fit, and the other hens have learned from experience to get out of the way when they see the bosses coming. These things had to be settled first. There was a little blood shed in the Mixed pen, in a contest between the Black Minorca and one of the big Wyandottes, but it was finally settled in favor of the active Minorca These favorite hens were hungry and tired. They went to roost early that first night, and in the morning were stirring about examining their new quarters. They sampled the dry mash, took a bite of charcoal and shells and made themselves generally at home. Several of them began investigating the trap-nests. We went to look at them shortly after Sunday noon and found every nest of the Leghorn pen containing a hen. It looked as if they had started in early to break the world's record, but there was not an egg in any of the nests. These inquisitive creatures were simply trying to spy out every corner of their new house and they had sprung the nest by mistake. They will soon learn, however, what the trap-nests are for, and then they will start on their year's record. The larger proportion of these birds are very good specimens, and we expect that several of them will stand up well in the final year's record. Some of them were evidently laying before they came. It is possible that these birds will now stop laying and proceed to molt or order a new dress in honor of the occasion. That is one disadvantage in sending laying birds to a contest of this kind, for the shock of the new surroundings will sometimes stop their laying and send them to the dressmaker for a light molt. It is too early yet therefore to know about this. We will watch them through the contest. As we see below, five of the Leghorns and one of the Buff Orpingtons had begun to lay; the others are a little slow, but they will come along later. The hens have been named by their owners, and we hope to give their records by name right through the year. You will notice that Beauty, the White Leghorn, is true to name when it comes to putting out the eggs, and we expect a lively record from a number of these favorite hens. We shall all watch their career with interest and the records of their work will be faithfully reported. We print the names of all the hens, even those which have not yet started to lay; the record runs up to the close of Nov. 11.

BOSTON MARKETS.

A GENERAL improvement in business conditions has helped the Boston market by making an improved demand for some of its products; a few foreign orders for onions have helped the market on these and boosted the price and demand for them. Good apples are doing better, partly because demand is largely for the best and also because the poorer grades are largely disposed of by this time in various ways; cider, canning, or have deteriorated so as to be unfit to offer for sale. This brings the better grades into use and a satisfied customer is usually a come-back for more. Good Baldwins bring up to $2.50 per barrel; McIntosh $3.50 and $4, other kinds and grades $1.50 to $2.50. Nearby box fruit 50 cents to $1.50; more is sold at the former figure or near it than the latter. Western box fruit $1.25 to $2. Bananas $1.50 to $3 for most sales of yellows, according to size of bananas and size of bunch for yellows; reds $2 up to $4 for fine ones. No improvement in cranberries, which are very low; $1.25 and $1.50 per box and $3.50 to $4.50 per barrel is all that can be worked out of them. Grapes still plenty, but in some cases of poor quality, especially California stock which some claim is caused by damp weather when packed. Prices about same as in the past few weeks. Grapefruit and oranges fairly plenty; a heavy southern crop will keep them so for a while and low prices will be the rule. The former go at $2.25 to $3 per box, the latter $2 and $3 per box for Florida stock and up to $4 for California Valencia. Lemons in good supply and sell at $2.50 up to $5 per box. Pears still in fair demand at good prices, $2 and $3 per box for Seckel, $2.50 and $3.50 for Bosc, Anjou and Sheldon $1.50 and $2.25; common stock for cooking purposes $1 and $1.50. Quince plenty and cheap, native about $2 per box, New York stock $4 per barrel; California stock about same price as native or slightly less.

Potatoes about the same in price, $1.10 and $1.20 per bag but supply is not heavy, and I understand an outside demand is likely at any time, which will move the price upward, perhaps quite a little. Sweets $1 per basket, $2 and $2.50 per barrel. On most other vegetables prices rule good, as supply is not much over demand, in some cases below it. Cabbage up to $1 per barrel for both drumhead and Savoy, with reds going at 85 cents per box. Cauliflower, native $1 per box; New York stock $1.50 per crate. Celery, white and self-blanching, $1 per dozen; Pascal $1.25, and Boston market $1.50 and $1.75. Cucumbers, best, $5.50 per box, others $5, $4.50 and $3.50. Lettuce 40 to 65 per box; squash, marrow, $1 per barrel; turban, Bay State and Hubbard $1 and $1.50 per barrel or per 100 pounds. Tomatoes $3 and $4 per box for ripe, $1.50 for green; hothouse 12½ cents per pound. Turnips, egg and purple-tops, 75 per box; rutabagas $1.25 per bag. Beets 75 cents per box; carrots 75; parsnips $1; radish 75 and $1.

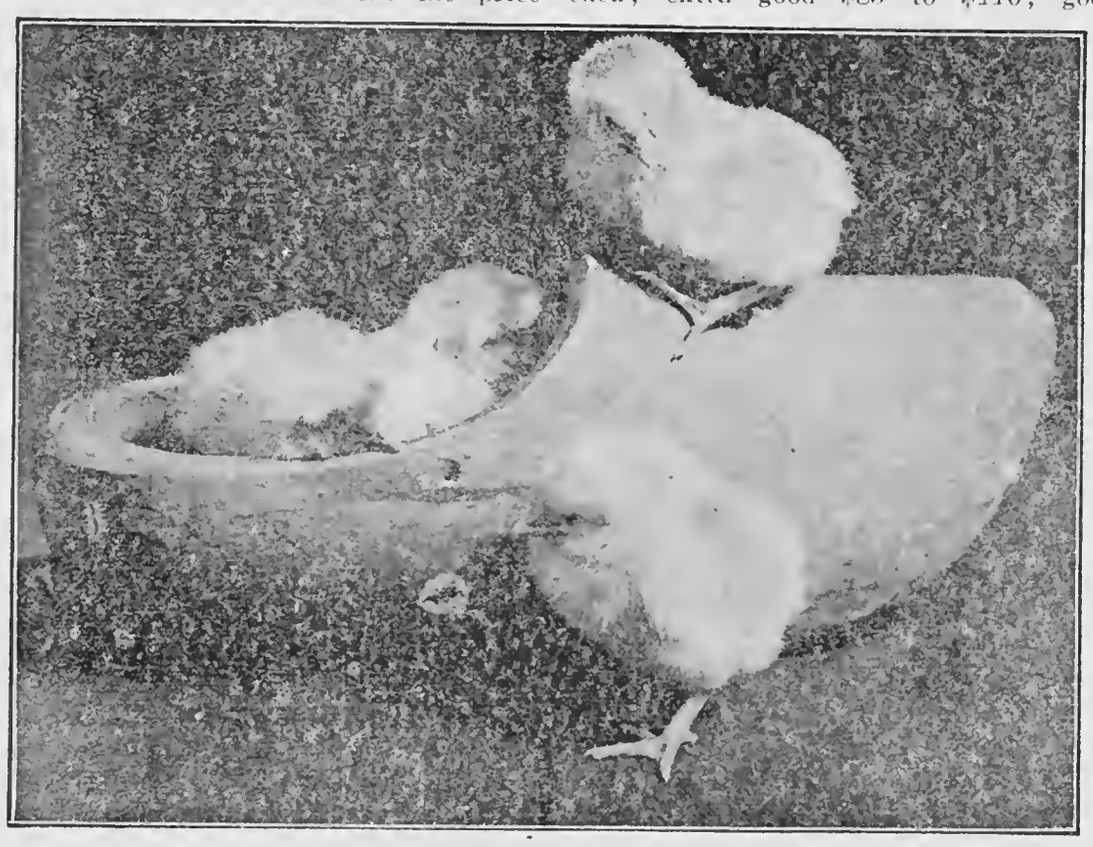
Apple shipments for week of Nov. 1, 13,315 barrels against 23,931 same week last year; total shipments up to date this year, 134,960, against 135,535 last year for same period.

Best butter one-half cent higher than last week; other grades about the same; supply not heavy, neither is demand, and the poorer grades sell slow. Best 36 and 36½ by tub, others 35½, 34½, down to 29 and 30 for fair creamery. Cheese sales slow, with supply plenty for demand, 17½, 16 and 15½ cents are general prices. Eggs very short for native nearby fresh, which bring 58 cents per dozen by case; Western more plenty but not enough so to affect the others; also 9,000 cases of these were shipped to England this week.

Live fowls and chickens 14 cents per pound; roosters 12; dressed fowls 14 to 19; broilers 21; roasting chickens 20 and 22; turkeys 28 and 30 for Northern stock, 22 for western; ducks 16 and 17; geese 20.

Best hay $24 per ton, other grades $16 to $22. Meal $1.61 per bag; oats 56 and 58 per bushel; bran $25; cottonseed meal $26 and $28 per ton; linseed meal $33; gluten $30.

Live hogs 7½ and 8; dressed 9½ and 10; live cattle $4.50 up to $8.75 per cwt.; common milch cows $40 to $60 each; extra good $85 to $110; good yearling heifers $15 and $18 each, two-year-olds $25. Bull, cow and steer hides 13, 14 and 15 cents per pound; calf skins 21. Horse market good for season and sales heavy, partly for home trade and also for export, as horses are in great demand over the water; prices range from $160 up to $450 according to size and soundness. A. E. P.



THEY WILL CROW AND CACKLE LATER.

A Barn Henhouse.

I SEE in the "Hope Farm Notes" mention is made of a barn henhouse. Last Summer I cemented the floor of my south mow, put a floor in about seven feet deep; cut out numerous windows on the south side covering with wire and saving the boards for shutters. Next to the driveway through the barn there is a board wall 2½ feet high, then wire up to floor above. This wire was covered with building paper in September, and the house is a very warm one. It is 14x28 feet, arranged with nests on the sides and no dropping boards.

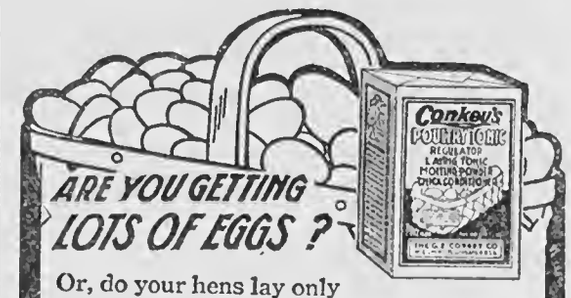
Connecticut. FRANCIS F. LINCOLN.

Poultry and Peanuts.

FOR three successive Fall we have noticed that when our Spanish peanuts are harvested and stacked near the barn, so that our White Plymouth Rocks can help themselves at will, the egg yield falls off. This year they have stopped laying almost entirely. Does this indicate that peanuts are not good for hens, or only that ours get more than is good for them? JOHN B. LEWIS.

Virginia.

Our guess is that a limited feeding on peanuts would help the hens—too many would make them too fat to lay. The peanut is rich in fat or oil and like other peas is relished by poultry. With this constant supply we think these Rocks get too fat!



Or, do your hens lay only when eggs are cheap?
Get the eggs this winter by starting to feed

CONKEY'S POULTRY TONIC

now. It doesn't force the hens but makes them want to lay because they are well nourished and strong.

Conkey's Poultry Tonic is an all round tonic that helps nature do its work—For this reason it is fine for every bird you own—young chicks, growing stock, molting fowls or laying hens.

Tell your Dealer you must have Conkey's—and write us if he cannot supply you. Remember, Money back if a Conkey Remedy or Tonic ever fails to satisfy you.

GET THIS BOOK—and learn to laugh at poultry diseases. It will make you an expert. Send 10c for a copy and we will enclose our Cash Value Coupon—something new.

THE G. E. CONKEY COMPANY

103 Conkey Building, Cleveland, O.

The Extra Eggs will soon pay for one of these **Automatic Self-Heating Poultry Fountains and Heaters**

Keeps water at the right temperature day and night in the coldest weather and requires less than a quart of oil a week. Made of Galvanized Steel. A long felt want supplied. Every Hen-house needs one. Price of 1 Heater and 2 gallon Automatic Fountain complete $1.15. Write for Circular R and testimonials. Agents wanted.

C. A. S. FORGE WORKS, SARANAC, MICHIGAN

MAKE HENS LAY

By feeding raw bone. Its egg-producing value is four times that of grain. Eggs more fertile, chicks more vigorous, broilers earlier, fowls heavier profits larger.

MANN'S LATEST MODEL Bone Cutter

Cuts all bone with adhering meat and gristle. Never clogs. **10 Days' Free Trial.** No money in advance.

The Henyard

THE EGG-LAYING CONTEST.

THE new contest at Storrs starts off with a full 100 pens as against the 82 pens in the last contest. The new breeds entered that were not among last year's competitors are American Dominiques, Light Sussex, Salmon Faverolles, Buttercups, Black Leghorns and R. C. Brown Leghorns. Edward Cam, of England, is in this time with a pen of White Wyandottes and a pen of White Leghorns, his Wyandottes laying 34 and his Leghorns 12 this first week. Thirty of the entrants of the last contest have entered birds again this year, one, the Branford Farms, entering *eight pens*. The highest record made for the week is by the White Leghorns from Windsweep Farm, Connecticut. This pen laid 47 eggs, every bird in the pen laying, one laying seven eggs. There are eight days in this first week, the date of ending the week being changed to Sunday night. A remarkable fact is that H. W. Sanborn's Rhode Island Red pullet No. 2 laid eight eggs in these first eight days, while none of her sisters in the same pen laid at all. White Leghorns also made the second highest record for the week; Albert Sondregger's pen laying 41. Edward Cam's Wyandottes are third, with a score of 34, and O. G. Knight's White Orpingtons fourth with a record of 29. The week's score follows:

GEO. A. COSGROVE.

Hen Questions.

WILL you give me your opinion on the following questions? 1. Cost per year 100 hens, buying all feed (White Leghorns)? 2. Average number of pullets per hundred chicks (50% or better)? 3. From pullets, raised from chicks bought from reliable poultrymen, what egg average should they have per year (pullets being White Leghorns, feeding not forced to an extreme)? 4. In your opinion, what effect will the present war have on the poultry industry? Will the price of eggs and chickens rise as compared to their feed, or will their price drop. Will the demand increase or decrease? H. D. H.

Niagara Falls, N. Y.

1. Answering above questions as nearly as possible I would say to the first, cost per hen $1.30 to $1.60, according to how much beefscrap and good wheat is fed.

2. General average is about 50% of each, males and females. It is believed by many that a large number of females to each male bird, will produce a larger per cent. of pullets, but so far as I know nothing definite has ever been worked out concerning it.

3. Twelve dozen eggs a year is a good average production, and can only be obtained by good care and good feeding. At the present contest at Storrs, cutting out the pen which has made an abnormally poor record, the average per bird of the Leghorns for 51 weeks is only a fraction over 154 eggs each; while the leading pen in the same contest has produced 17.3 dozen, or 207.8 eggs per hen, in the same time.

4. My *guess* is that the war will not materially affect the price of eggs either way, because we neither import nor export a sufficient quantity to affect the price very much. GEO. A. COSGROVE.

BUFFALO MARKETS.

EGGS are higher and potatoes and onions are a trifle lower. Farmers are getting 30 cents for potatoes and 40 cents for onions. Good-sized cabbage heads sell for three cents retail. Honey is low, 17 to 18 cents per pound, wholesale. Apples are not only of much better quality than formerly, but are selling by name more than ever. The highest wholesale quotation is $2.65 per barrel, with $1.25 for No. 2. The retailer sells Greenings at 50 to 60 cents per bushel, Baldwin at 60 cents, Spy at 75 cents. Butter is quoted at 37 cents down, wholesale, but market retailers do not quote above that price to consumers, with cheese 20 cents retail. Eggs continue rather scarce, at 45 cents wholesale, though the general retail price is not above 30 cents. Oleo in pound packages retails at 23 cents. Grapes are still very plenty and cheap, at $35 per ton for blue, wholesale and 35 cents for 20-pound basket. A red Rogers grape is taking the place of Catawba for late carrying, though there are still plenty of Concords. The California Tokays are as plenty as ever and in perfect condition, retailing in big bunches at eight cents per pound. Peaches an' plums are gone. The showing of pears is poor and only Kieffers are quoted, at 50 to 75 cents a bushel. There are a few others, as for instance Beurre Clairgeau, but not in any quantity. The quince crop is small also and quality poor, retailing at 75 cents per large third-bushel basket. Cabbage is a big crop, the wholesale price being $2 to $3.50 per 100 heads. There is also more cauliflower than usual, good heads retailing at 10 cents each. Some Brussels sprouts are offering at not less than 20 cents per quart, retail. Celery is fine and plenty at 10 cents per small bunch to 40 cents per large bunch wholesale. Lettuce is still cheap at 20 to 30 cents per dozen heads and radishes retail at three bunches for five cents, spinach 15 cents per peck, retail. Cucumbers and tomatoes are beginning to return to hothouse prices, being $1.25 per dozen for the former and 20 cents per pound for the latter. Poultry is scarce, but in light demand, at 23 cents per pound for turkey and 17 cents for fowl dressed, wholesale and 20 cents for turkey and 15 cents for fowl, fancy, live. J. W. C.

CLEANING SOILED EGGS.—We have been helped so many times by suggestions found in your paper, that I would like to return the favor by sending an answer to W. R., who asks in regard to the cleaning of soiled eggs. We have found that a cloth moistened in vinegar will remove the moist stain, much quicker and easier than scouring powder, and does not polish the shell as scouring does. J. L. R.

Vineland, N. J.

SOILED EGGS.—W. R., New York, wants to know how to remove spots from eggs. We have found the best way to remove spots from eggs is to rub with a cloth moistened with a little clear vinegar. Another good solution for cleaning eggs, is one ounce of ammonia and two quarts of water. I have gathered as high as 80 dozen eggs a day in mid-Winter, and of that number there would be a few that would require cleaning. We look for the "Henyard" in THE R. N.-Y. every week, to see how the "hens" are coming in the egg contest. We have a pen of "hens" we are going to run against our Reds and Rocks this Winter.

North New Salem, Mass. E. L. C.

A SMALL boy seated on the curb by a telephone pole, with a tin can by his side, attracted the attention of an old gentleman who happened to be passing. "Going fishing?" the old gentleman inquired good-naturedly. "Nope," the youngster replied. "Take a peek in there." Investigation showed the can to be partly filled with caterpillars of the tussock moth. "What in the world are you doing with them?" "They crawl up trees and eat off the leaves." "So I understand." "Well, I'm fooling a lot of them." "How?" "Sending 'em up this telephone pole."—Judge.

Brood 500 Chicks in One Flock
Save Time, Labor, Fuel and Money

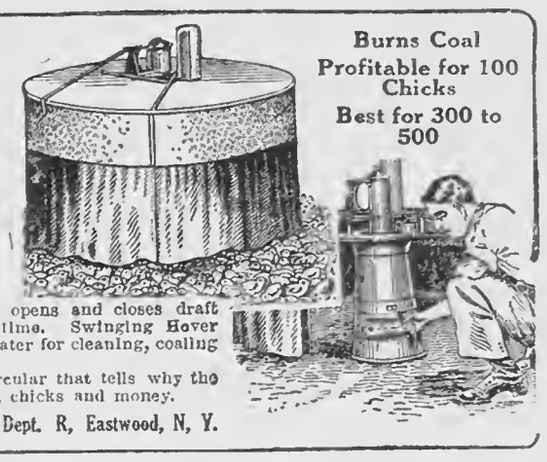
Got all your chicks out early at one time and carry them safely to strong maturity.

Take your eggs to a Candee Custom Hatchery or buy baby chicks there. Then, with a coal-burning Candee Colony Brooder, raise all of them in one flock, in one house, with only one heater, at a cost of a few cents a day for coal.

Healthy Heat—Automatic Heat Control
Coal-Burning—Safe—Sure

Sealed base, cast iron heater—no worry, no danger of loss from fire. Magazine Feed keeps even fire—eliminates guesswork. Thermostat automatically opens and closes draft and holds correct heat all the time. Swinging Hover Section makes it easy to get at heater for cleaning, coaling and shaking down ashes.

Write today for illustrated circular that tells why the Candee will save you labor, fuel, chicks and money.



Burns Coal
Profitable for 100 Chicks
Best for 300 to 500

Publisher's Desk

THE case of Miss Mabel Hastings of Montclair, N. J., against D. B. Cornell, of Great Barrington, Mass., was heard in the superior court at Pittsfield Tuesday. The case is a contract action to recover about $800 which plaintiff claims is due her in connection with the sale of the Bastine property in South Egremont. The jury returned a verdict yesterday afternoon for the plaintiff, Miss Hastings, in the sum of $809. It is understood that an appeal may be taken.—Local Paper.

Our contention about these real estate transactions is being verified in the courts wherever tried; but always with annoyance and expense to the buyer or seller. The way to avoid such annoyance and expense is to get all information in advance from disinterested sources, and then employ a local attorney to draw up the contract and secure title.

Are the North American Accident Insurance policies worth while? Several policies are in force in this section, including my own and I would like to have your opinion of them. C. B. A.
New York.

If the insured can make out a case under his contract, he may, of course, recover; but the policies are very strictly limited, and very skillfully drawn, so that they may not mean just what you might conclude on a casual reading. They are confined largely to such accidents as one is liable to in the city, but seldom occur in the country. The conditions are very technical. For example, the $250 for loss of life, is restricted to loss within 30 days of accident, and death must result from accident independent of all other causes. Most of us have some ailment, acute or chronic, and this would seem to exclude the possibility of a claim. The whole contract is covered with just such technical requirements, and it is difficult to see how a claim could be presented which would not be affected by the restrictions. This is probably necessary in order to write a policy on a small annual premium; but what is the good of a policy unless it protects one in case of an ordinary accident?

Last May an agent of the Herrick Seed Company, Rochester, N. Y., took a small order of trees from my husband. He did not have his glasses and signed without reading the fine print. The agent said the trees would be all of one caliper. In September we wrote the company that we could not use the trees and cancelled the order, but received no reply. The last week of October a bundle of trees was thrown on our lawn from a driver's wagon. We still refused to receive them, but the driver said to heel them in and notify the Herrick Seed Co., as others were doing. We now see that the trees are not of the same caliper, and trees of equal quality could be bought for one-third of the price charged for these. We have just settled in the neighborhood and do not want any litigation, but cannot use the trees. What should we do?
Pennsylvania. G. H. W.

If you had sent your order to a reliable house by mail and afterwards cancelled it, the goods would not have been shipped, and money and trouble would have been saved. Sometimes an order may be safely placed with a responsible agent of a reliable nursery, but unless you know the agent and the house you are taking chances. When such concerns go into court to enforce the payment of such claims, they usually have to meet the representations of their agents, and not infrequently lose their cases.

"All guaranteed five years and backed by 62 years' experience; all shipped on 30 days' free trial. Double the power of other engines of equal weight, runs smoother. Starts easier."

"You will make the best investment of your life if you will send us your order for an engine by return mail. We will give it our careful attention and see that you get an outfit that will be a record breaker and prove a good advertisement for our line in your territory. We maintain that no one who places trust in the integrity of this company will have occasion to regret it."

The above extracts from letter, circulars and advertising of the Temple Pump Company of Chicago, Ill., induced Mr. Prom, of Miami, Florida, to send them an order for a six horse-power Master Workman engine, to be used in driving an irrigation pump. The cost of the engine including some extras, was $153.55. The order was given in April, 1913.

All sorts of difficulties, from the correspondence and the reports of Mr. Prom, seem to have been encountered as soon as attempt was made to operate the engine during which time experienced engineers and operators were called in in an attempt to make it do the work. After becoming satisfied that the engine would not develop sufficient power to operate the pump, suggestions were made to exchange it for a single cylinder engine costing less money than the original. Mr. Prom offered to accept the exchange, the company to pay the freight both ways if the fault were theirs. When the Master Workman engine was returned to the company at Chicago, they set up the claim that the fault was not theirs; that the engine had been taken apart, and improperly assembled and generally abused, and refused to pay the freight. Mr. Prom maintains that the engine was never taken apart, that only the ordinary adjustments were attempted, and that it was handled only by engineers and operators who were entirely familiar with the operation of gasoline engines.

Mr. Prom then complained to the agricultural papers in which the Temple Pump Company advertising appears. After some correspondence they refused him any redress. THE R. N.-Y. does not carry the advertising of the Temple Pump Company, and has refused it for several years because of similar complaints received from other subscribers, but complaint was made, nevertheless, and we attempted an adjustment of it. The company intimated that they would make an adjustment through the papers in which they were advertising, but this has never been done.

The papers carrying the advertising contend that the Temple Pump Company was not to blame in this transaction. We take a different view of their responsibility, but we are always tolerant of the opinions of others. We refer to the transaction at this time that farmers may have understanding of the difficulties sometimes encountered in buying implements on 30-day guarantees. There is often a delay in receiving machinery; frequently delays in getting it set up and arranging conditions just right for a test, and it is not infrequent that the 30 days expire before there is any opportunity to test the implement at all. But if it is held beyond the time the purchaser technically loses his right to return it. In this particular case, when the engine was found unsatisfactory, it might have been returned and freight both ways demanded in addition to the refunding of the purchase price, but the purchaser was first induced by the necessities of his case, and the hope that it would ultimately work, to continue adjustments of it past the 30 days. He was then induced to exchange it for another engine with promise of better results, and he was probably induced to accept this compromise because of the necessity of having an engine promptly to do his work. He yet complains that the new engine is not satisfactory, but that he continued to use it past the limit of time for trial. He insists that the freight on the original engine should be paid by the company under their original guarantee, because it proved unsatisfactory. If he had not consented to an exchange the company were responsible for the freight. While the other publishers agree with the advertiser, THE R. N.-Y. feels that Mr. Prom's contention is right. Naturally the company would prefer to make an exchange rather than to redeem the old engine and assume the freight expenses, and as the first engine at least was a failure, they were responsible for the freight. The Temple Pump Company's present attitude is that they must be the judge in all cases, and if they contend that the failure of the engine to work is due to the carelessness or ignorance of the party, then they are relieved from their guarantee. This position might be tenable if plainly stated at the time the sale is made, but no such provision appears in any of their literature.

THE R. N.-Y. has refused this advertising because of the record the company has made with our subscribers. If we were carrying the advertising at the time of this transaction we would feel the obligation of sending a check to cover the demand from Mr. Prom. We have, under the circumstances, no such obligation, but our people ought to understand the difficulties sometimes encountered in the purchase of goods under the 30 days' trial. If the tradition of the house is right, it does not make any difference what the limit of trial may be; but if the concern is given to technical interpretations of its literature, it is difficult for a farmer to avoid controversy, when anything goes wrong.

Let me join the Anti-Fake Club. I believe that every intelligent man and woman should be made to see that it lies in their power to wipe out fake advertising by limiting the subscriptions to persons who take your stand. P. M.
Maine.

No fake concern can exist except through the encouragement of credulous people, and most of us are credulous at times. The thing to realize is that we must use our influence against their petty robberies. No one person can accomplish much alone; but members acting together can accomplish wonders. Refuse to subscribe for papers that carry their advertising, and let the publishers know why, and we will dispose of a large portion of them. That is the task of the Anti-Fake Club.

On September 25 I sent you receipt for a shipment of three cases of eggs sent to a New York party in February 16. Adams Express Company lost one of the cases of eggs, and I have been seven months trying to get them to settle. I got tired and sent the claim to you, and am greatly surprised to have the claim settled 14 days after it was turned over to you, and I surely am thankful to you for all the trouble. It is wonderful how THE R. N.-Y. can make Adams Express Company come to time and behave themselves, and especially that I not only got my money for the eggs at 45 cents a dozen, but they paid back 27 cents expressage and 6% interest for six months, making my check $14.19. I greatly appreciate your trouble and thank you.
New York. A. P. L.

This is the first time we have had an express company pay interest on a claim. When a matter hangs fire six or seven months for no legitimate reason, the shipper is certainly entitled to interest on his money. This ought to be incorporated in the Interstate Commerce Commission ruling, and we shall offer the suggestion to them. J. J. D.

Certified Milk in Ohio.

"WHERE there is one certified plant now, there will be a dozen, a decade from now," is the opinion of E. G. Scripture of Ohio. "I have been producing certified milk for a short time, two years, and the matter of meeting local demand requires no great expense as compared with the returns. I could sell two or three times my product were I disposed to increase my herd. When I decided to produce better milk, I went to the local board of health, I had them outline their demands, then I modified my dairy equipment to meet these demands, and I found I was getting out of it rather reasonably. After I fitted my buildings, I invited veterinary inspection. Only one of my animals was condemned. I was given a certificate and this certificate not only is an evidence of god healthy cows, but is a leverage on a vigorous business. The advertising value of 'Certified Dairy' on the milk bottle cap is worth the expense. When several doctors advise that the milk of my farm is the best in the locality, mothers are anxious that their children should be reared on this milk. I have only 15 cows, and do not intend increasing my herd, owing to my age, but there is room in the vicinity of every small city, and possibly in every village for a certified plant."

Obstructed Teat.

I HAVE a cow that injured one of her teats in getting over some plank. While it has never been inflamed it has become very hard to get the milk started from it; after it starts it seems to be all right. What can be done? S. R. A.
Kentucky.

Sterilized teat plugs or dilators, to be bought of a dealer in veterinary instruments, or ordered through the druggist, may do away with this condition. If not then it may be found necessary to slit through a stricture or an obstruction or growth at the tip of the teat, by means of a sterilized teat bistoury. This should be done by a trained veterinarian. Without a personal examination we cannot decide just what condition of the teat is present. A. S. A.

Chilly-Weather Comfort

You can laugh at the snow and the winter winds when you're snug and warm in a Clothcraft overcoat.

Light weight, warmth, great durability. That's where pure wool comes in—all Clothcraft Clothes, you know, are *guaranteed* all-wool.

Then, too, there's the fine workmanship. Every little operation in making a suit or overcoat has been perfected in the Clothcraft shops.

Thousands of dollars are saved by this scientific tailoring and put back into fabrics, linings and other additions to quality.

That's why we can offer you such a variety of beautiful Clothcraft patterns in suits and overcoats at $10 to $22.

You'll be specially interested in Clothcraft No. 4130 Blue Serge Special that sells for $18.50.

The Clothcraft Store
(in your town)

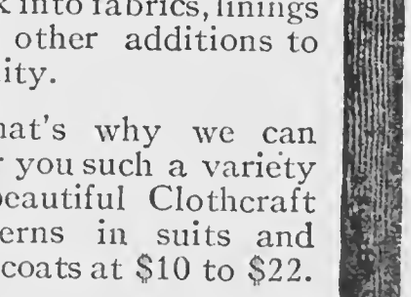
Write to The Joseph & Feiss Co., 635 St. Clair Ave., Cleveland, Ohio, for their new Style Book, a sample of the all-wool fabric used in Clothcraft "4130" and a personal note of introduction to the Clothcraft Store nearest you.

Feed Grinding and Wood Cutting

In the Winter every farmer finds himself beset with numerous jobs—big and small—every-day jobs and occasional ones. This is where an efficient, reliable power plant is a time and money saver.

The "Badger" Engine is made well from start to finish; made to run without interruption; not merely to sell.

It is simple—anybody can run it or adjust it. It is economical, using less gas or gasoline than any engine known. It develops more power than rated. There are many types and sizes of "Badgers" to suit every individual need. Any BADGER is a GOOD engine.



Badger

The "Badger" is always ready to run—Winter or Summer—at an instant's notice. Every part guaranteed for five years unconditionally.

Send for Catalog. Free Engineering lessons sent on receipt of dealer's name.

Address. The Christensen Engineering Co., Milwaukee, Wis.

Products, Prices and Trade.

Wholesale Prices at New York.

Week Ending Nov. 13, 1914.

MILK.

The Borden milk schedule to producers for the six months beginning with October is as follows. This is per 100 pounds in the 26-cent zone. This is what is known as the "maximum" for milk testing 3.8 to 4.2 per cent. fat, and is 20 cents per 100 pounds above the "flat" rate.

	1914.
October	$2.00
November	2.10
December	2.10
January	2.05
February	1.95
March	1.90

Wholesale prices paid by New York dealers are running $2.01 and $1.91 for B and C. Hotels and restaurants using two to three cans per day are paying five to six cents per quart, single quart prices from bakeries and grocery stores, six to seven cents; delivered milk, nine to 10 cents.

BUTTER.

A shortage in receipts and irregular quality in much of the current make have caused an advance of one to two cents on the better grades, fancy lots having wholesaled at 36½ cents. The high prices have called out storage stock, the best bringing 32 to 33 cents.

Creamery, extra, above 92 score, lb	36	@	36½
Extra, 92 score	35	@	35½
Good to Choice	28	@	32

Process	22	@	26

Elgin, Ill., butter market 33 cents.
Philadelphia, western creamery, 35 cents.
Chicago creamery, 26@33.

CHEESE.

Business is dull, and dealers ready to cut prices where necessary to make sales. But few sales at the top figure are noted, 15 cents covering most high grade trade.

Whole Milk, fresh, specials	15	@	15¼
Average fancy	14¾	@	15

DRESSED POULTRY.

The present outlook is that Thanksgiving turkeys will have to be good to bring 20 cents or more at wholesale, though much depends on the weather and the quantity producers hold back for later holiday trade. This early holiday is always a critical time, because of weather uncertainty. A warm, sticky spell raises havoc with dressed poultry. The bulk of the Thanksgiving market demands good quality, so that thin birds would better be held back and put in better condition. Be sure that the animal heat is all out of the birds before packing, otherwise there will be serious loss.

*

The Government of Holland has decided to take charge, for the time, of all imports of flour, grains and cattle food. Steamers reaching Holland will refuse shipments consigned to private parties there.

*

The citrus orchards of California have 13,000 orange and 3,000,000 lemon trees. Two-thirds of the orange and a trifle more than half the lemon trees are in bearing. The past season 46,267 cars of citrus fruit were shipped from California.

*

In some parts of the west apples are being marketed in bushel sacks. They get somewhat bruised in handling but are satisfactory for quick use, and the lessened packing and shipping expense makes possible a price that offsets the damage.

*

The railroads entering New York are about to cut the free storage of flour from 10 days to five, making storage charges one cent per hundred pounds for each 10 days after the free storage period. The flour men state that as the profit made by the flour wholesaler is small, the added cost of storage will increase the price to the consumer. The argument favoring the new ruling is that the storage privilege is abused but on the other hand it is claimed that a 10-day latitude is necessary to handle the large flour distribution at New York and guard against shortage by storm delay to arrivals.

CROPS AND PRICES.

No. 10. Dairy cows are a drug on the market. I have two nice young Holstein heifers giving good milk; I must sell for beef at seven cents per pound; cannot find a market for milk cows. I usually keep six milch cows, but owing to short crop of hay must sell my two good heifers. Every farmer I know is more or less short of feed, especially hay. Farms are all small, only two in town over a hundred acres. There are two farms for sale, which have been on the market for years.
Eastport, Me. J. A. D.

Nov. 9. Cattle raisers are much concerned over the foot and mouth disease which has invaded the upper part of the State near the Pennsylvania line, the disease being discovered among a herd of cattle shipped to farmers from Lancaster, Pa. The State is now quarantined. Sweet potatoes were a large crop and large quantities are still being shipped to the city markets. They are bringing 25 cents per basket at stations. Total shipments of apples over the Delaware railroad to date for the season 659,085 baskets; pears, 357,591 baskets; tomatoes, 835,945 baskets; sweet potatoes, 78,910 barrels; white potatoes, 195,507 barrels. An agricultural agent has been appointed for Kent County. Farmers are very much interested in this new movement for their benefit, and will soon take hold of the work as soon as they find out the mission of the agent. Plans are under way for holding a Kent County corn show some time in the early Winter. Every farmer is being requested to save out a sample of his corn to enter in this show, as there will be premiums for classes and colors of corn. The yield of corn is larger than for five or six years. New corn on cob bring 56 cents, old corn 80 cents, wheat $1.10; white potatoes 35 cents per basket, butter 30 cents; eggs 28 cents, chickens 13 cents, pork $10, hay $17. Finer Fall weather was never known, there was no killing frost until about the last of October. Early sown wheat is making a luxuriant growth. Several new silos were filled and more will be built next year. Some hogs are dying with cholera
Dover, Del. C. H.

Nov. 9. Milk is running a little higher than heretofore at this time of the year. Most of our milk is going to the Pittsburg milk dealers, and one company is paying $1.65, skim-milk back; another is paying $1.45 for the whole milk. Most of our farmers appear fairly well satisfied with the prospects, and the general tendency seems to be to carry more rather than less cows. We are getting more silos in the community every year, and usually a man who builds a silo winds up by stocking heavier. Without actual figures at hand, I think that there are more cows being shipped into this section this Fall than for some time past, and fewer being shipped out. Our farmers are well provided with feed this Fall, but the general rule is to buy a lot of mill feeds to make up the protein to balance a corn and Timothy ration. We do not raise enough of our own feed, and then we always have a kick on the price of mill feeds. At the sales around us cows are going at lower prices than for several seasons past. A good grade Holstein that would have sold at $110 to $125 last Fall or the year before will go this Fall at about $80 to $85.
Orwell, O. W. H. P.

Subscribers' Exchange

Complying with several suggestions received recently, we open a department here to enable RURAL NEW-YORKER readers to supply each other's wants. If you want to buy or sell or exchange, make it known here. This Rate will be 5 Cents a word, payable in advance. The name and address must be counted as part of the advertisement. Copy must reach us not later than Friday to appear in the following week. No display type used, and only Farm Products, Help and Positions Wanted admitted. For subscribers only. Dealers, jobbers and general manufacturers' announcements not admitted here. Poultry, Eggs and other live stock advertisements will go under proper headings on other pages. Seed and Nursery advertisements will not be accepted for this column.

WANTED—Single man to farm 50 acres on shares; fruit extra. M. S. VAN DER VEER, R. F. D. 1, Hightstown, New Jersey.

WANTED—Work driving or handling horses or in cow barn, single, American, 23; life experience. Address H. B., care Rural New-Yorker.

POSITION WANTED—Practical farmer; butter and cottage cheese maker for fancy trade; married, references. C. L. GIVEANS, Vernon, N. J.

WANTED—A woman who for a good home is willing to help with housework in a small family in a beautiful country. M. B. M., care R. N.-Y.

POULTRY EXPERT—Desires position as manager commercial chicken farm; practical experience combined with theoretical knowledge; references furnished. L. A., care R. N.-Y.

PRACTICAL POULTRY MAN, experienced in all branches of poultry work, single, desires position, either as poultryman or assistant; small wages for winter months. POULTRYMAN, care Rural New-Yorker.

POSITION WANTED—About Jan. 1 as farm manager or working foreman, by single American of 25; not a college graduate, but a close student of agriculture, and have a thorough practical knowledge of modern up-to-date farming in all branches; if you want results try me; references exchanged. V. N. E., care Rural New-Yorker.

WANTED—By first-class manager, at present employed managing a large private estate, a position of similar capacity, private or commercial, thoroughly versed in up-to-date farming and thorough-bred stock raising. Capable of managing any large proposition. Highest references. Satisfactory reasons for leaving. Address "SHELDONCROFT," Silver Lake, Pa.

YOUNG MAN, 27, single, wants position as superintendent or head dairyman on private estate; life experience in farming, handling and feeding purebred stock, can do own doctoring, tuberculin and Babcock testing; excellent buttermaker, thoroughly understands certified dairying, raising rotation crops, vegetables and management of help; first-class references. Box B. K., Rural New-Yorker.

ALFALFA HAY—F. P. ERKENBECK, Fayetteville, N. Y.

WANTED—Car cheap Clover Hay. A. S. BELL, Ashley, Pa.

CHOICE WINTER APPLES; two dollars per barrel. BENJ. WILLIAMS, Rushford, N. Y.

NEW HONEY—Basswood or clover in sixty-pound cans; write for prices. C. A. HATCH, Richland Center, Wis.

APPLES, APPLES, APPLES—For choice sprayed Winter Apples. Please order to-day. C. J. YODER, Grantsville, Md.

28 INNCUBATORS FOR SALE—All models, 260 and 360 eggs, in first-class condition; reasons for selling, am installing a Mammoth machine; write for prices. CHAS. R. STONE, Staatsburg, N. Y.

ALFALFA FOR SALE—Fifty tons first cutting, thirty tons of second cutting, all cut early, well cured, bright and pea green; have sold farm and must dispose of Alfalfa. JOHN McLENNAN, Fayetteville, N. Y.

GRAPEFRUIT AND ORANGES by express in half or whole boxes, F. O. B. Miami, Fla.; fancy brights at $1.75. Golden Russets at $1.50 per box, with order; delivered prices quoted on request. GEO. B. CELLON, Tropical Grove, Miami, Fla.

FOR SALE—320 acres unirrigated land, fenced, near Lamar, Colorado, $10 per acre, half cash. ALBERT A. CORB, Guilford, Conn.

WANTED TO LEASE—With option to buy, a place about eight acres, bordering pond or stream, near New York City. S. R. E., care R. N.-Y.

AUCTION—Fruit and dairy farm 189 acres; excellent buildings and water; partners selling out Nov. 30. Write WM. W. HALLE, Craryville, N. Y.

SALE of creamery, real property and water privilege; also personal property, in parts. TOWN HALL, Livingston, N. Y. Dec. 4, 1914, at 1 o'clock P. M.

WANTED—To trade 12-apartment brick block in Dorchester, Mass.; yearly rental of $3,200; for good, well-equipped farm. JOHN KING, Stafford Springs, Conn.

FOR SALE—Farm 85 acres, 65 under cultivation apple and peach orchards, one-half mile of depot and town of 1,000 inhabitants; bargain to quick purchaser. HANSON S. PHILLIPS, Hebron, Md.

$80 PER ACRE—Productive, highly cultivated 82-acre farm, located at city line, Corry, Erie County, Pa.; good house, fine bank barn, two silos; right at splendid city, market, schools, churches, roads, etc., finest water; produces immense hay, ensilage, pasture and other crops. JOHN I. COLEGROVE, Sheffield, Pa.

FOR SALE—35 acres; 9 timber, 26 black gravel soil, no stones, 8-room house, barn, sheds, poultry houses, all good as new; land in condition for gardening, trucking, macadam road; telephone line, schools, churches, stores and depot within one mile; price, $4,500. HENRY C. MEYER, R. D. Flanders, Morris Co., New Jersey.

117¾ ACRE ONEIDA COUNTY DAIRY FARM, $4,900; $2,500 cash; balance easy terms; brand new 10-room house, finished oak and cherry, natural; water and sink in kitchen; new cement basement barn, stanchion 20 cows; hay track; plenty other good buildings; $500 worth new, heavy oak furniture; all tools, machinery, etc.; 3½ miles to city and railroad; on crushed stone road. Wish to hear only from those interested. Address owner, NORMAN HOOVER, R. 5, Camden, N. Y.

"BALL-BAND" TRADE MARK

8½ Million Men

Look For That Red Ball Before They Buy

"Ball-Band" Rubber Footwear is worn by eight and one-half million men—and sold by over 50,000 stores. *It has to be good footwear.*

Nobody knows this better than we do. We know that "Ball-Band" Rubber Footwear *must* fit. It must be comfortable to the feet and it must give long, steady wear.

Our rubber is treated and worked by men who have spent their lives in finding ways to make rubber stand more wear. Every spot that gets a bit of extra wear or strain, there we put extra strength. We have to be familiar with every kind of work the man who buys "Ball-Band" is liable to do. Walking, ditching, chopping, climbing, stooping, carrying burdens—all these things throw different strains on different parts of the footwear, and in making "Ball-Band" Rubber Footwear we must take these into consideration.

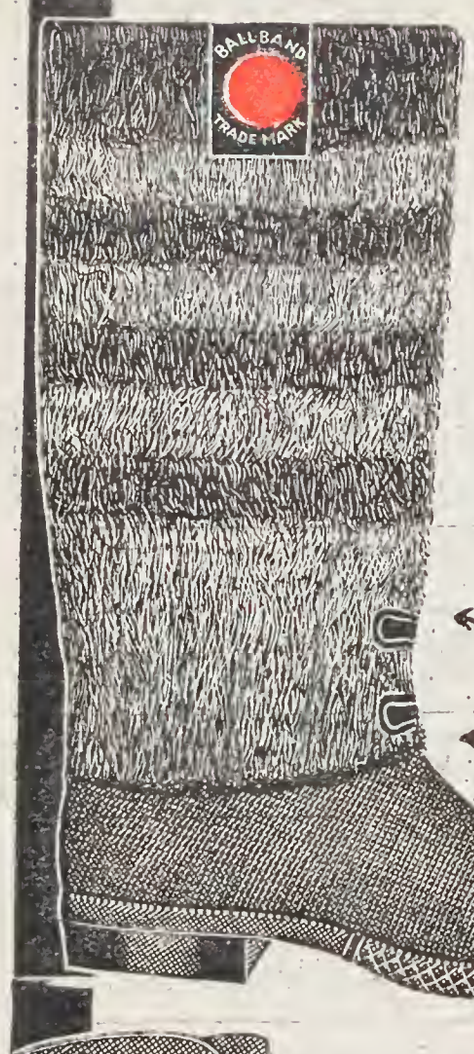
We have spent millions to build up the "Ball-Band" reputation for quality, and it is why we are spending large sums to add to that reputation.

"Ball-Band" Rubber Footwear is sold by 50,000 stores. The Red Ball Sign is in the window and on the goods. Look for it. Be sure it is a bright, round Red Ball, and not a deceiving imitation.

When you buy "Ball-Band" you get *more days wear for your money* than it is possible to get in any other kind.

"BALL-BAND"

TRADE MARK



The "Ball-Band" Coon Tail Knit Boot is knit, not felt, insuring the utmost wear and service. Ours is the only high-grade knit boot of this character on the market. The patented snow excluder keeps out snow, dirt, grain and chaff and keeps the ankles warm. Heavy gum overs to fit. This boot is completely shrunk; it can be washed when dirty—it simply *won't* shrink any more. *Look for the Red Ball on the Straps.*

From HERE to HERE — The knit boot overlaps the rubber

"Ball-Band" Arctics are made with one, two and four buckles. Look for the Red Ball on the sole. The tops are best cashmerette and the warm linings we make ourselves from the same kind of wool that goes into the Coon Tail Knit Boot. Fine to wear at work, or to protect your good shoes. A strong, sturdy piece of footwear.

4-Buckle Arctic

Our FREE Booklet "More Days Wear"

tells you how to make your rubber footwear last longer. There are many ways that even good rubbers can be innocently ruined. It will pay you to know what they are. Ask us to send you a copy.

If no local merchant can sell you "Ball-Band," write us and tell us his name and we will see that you are fitted.

"The Opening of a Chestnut Bur." Fig. 611.

SOY BEANS AND SILAGE CORN.

THE growing of Soy beans with silage corn is one of the happy combinations whereby a leguminous and a non-leguminous crop may be grown together with considerable advantage to the dairyman. It is rapidly becoming a very common practice to grow these two crops together. Owing to a considerable amount of impractical or prejudiced advice or lack of experience on the part of some men who have made a half-hearted attempt to grow this crop, much misinformation has been spread abroad. There are three ways that these two crops may be planted, cared for, and worked into the silo together each of which may be satisfactory.

1. The crop of Soy beans may be planted separately from the corn and cultivated as commonly practiced with ordinary field beans. At the time of filling silo the corn and Soy beans may be cut into the silo alternately using one load of beans to three of corn, or

2. The corn and Soy beans may be planted in alternate rows of two rows of corn to one of beans. This method might mean extra labor at the time of planting though it would not be any extra labor to harvest the crop.

3. The better way and perhaps the most commonly practiced is to mix the Soy beans and seed corn together, using the regular amount of corn and supplement this with three to four quarts of Soy beans per acre. In this method the planting is done at one operation. The two crops are cared for as one, and at harvest time the mixture is harvested with a corn binder and the corn and Soy beans cut together into the silo with no extra labor involved.

The presence of the Soy beans in the silage naturally tends to increase the amount of protein in the silage, an important point for the dairyman to consider. The two crops grow together to no disadvantage. What few plants the binder would fail to pick up would be greedily eaten by the cattle pasturing on the stubble. At planting time it has been noticed that when planting the mixture the Soy beans being somewhat smaller than the corn, tend to run out of the hopper more freely than the corn. Thus at the end of the bout the proportion of corn to Soy bean seed might be varied unless a few extra beans were carried to throw into the hopper. For the Northern States doubtless the variety known as the Medium Early Green, having a green seed, is best suited and most commonly grown. If planted early the Early Green variety will mature seed in northern New York before killing frosts.

Dairymen should not hesitate to try growing Soy beans with their silage corn. The beans will grow well anywhere that corn will grow well. The mixture is a good one and no one should get discouraged or draw conclusions from the experience of one year. Soy beans enrich the soil and the silage.

F. E. ROBERTSON.

R. N.-Y.—We have many reports from farmers who say the Soy beans are good, but not for the silo. These men fill the silo with corn and dry the Soy beans for hay.

GUARANTEEING EGGS FOR HATCHING.

LAST year there were many complaints from purchasers of eggs for incubation. The per cent of fertile eggs was often low, and some of the breeders who sold the eggs felt sure that their stock was vigorous and that the eggs were right. Is there any way of marking such eggs so they can be returned and identified if not right, and should the breeder guarantee a fair per cent. of fertility?

Undoubtedly your inquiry is due to the poor hatches which were so general during the early part of our last hatching season. This condition was caused by the severity of the preceding Winter, probably. It is very difficult to obtain good hatches during the late Winter and early Spring months, especially if the eggs are shipped quite a distance and are exposed to extremes in temperature. There is bound to be much dissatisfaction over results obtained from early hatches. The producer cannot prevent this. Nevertheless, if he cares to guarantee his eggs, it is quite imperative that he mark them in some way so that there will be no question as to their identity. The simplest method for small producers is to write their name in pencil on the shell of the egg. Where eggs are shipped in large quantities, and the time required to mark the eggs becomes an important factor, then a rubber stamp with slightly concave surface, and bearing his name or trademark can be used to mark the eggs quickly after they are placed in their carrier. I refer to a stamp such as commonly used in marking eggs for a special market trade. If it is sufficient merely to insure the delivery of the eggs, then sealed packages can be used, or a common egg case can be sealed with a ribbon of gummed paper which bears some private mark, to prevent duplication.

Under some conditions, especially if the eggs are hatched by hens, the ink ordinarily used for stamping will rub off. This is not the case with pencil marks. Frequently breeders trap-nest their hens, and write the number of the hen's leg-band on the egg, together with the pen number. This is the method practiced at Cornell, and it serves to identify the egg whether it be marketed or incubated.

In my opinion the best way to protect the buyer against low fertility and hatching power in eggs, is to advise him to purchase during the natural and normal hatching season (April and May) when eggs are running high in fertility and strong in germ, rather than to follow the present practice and fad of hatching in the abnormal season of February and March. During these months it is very difficult to get satisfactory hatches, except in our warmer States, and at this time a breeder is very foolish to guarantee good results, and the purchaser is equally foolish to expect them. At the present time the big demand for eggs comes very early in the season, and naturally the breeder endeavors to supply that demand. Conditions are liable to remain as they are until we are able to change the demand for eggs to the normal hatching season.

C. A. ROGERS.

BE FAIR IN PARCEL POST PRICES.

I HAVE been interested in the parcel post since the beginning of the agitation in its favor, and I had hoped that the passage of the bill would be a positive and material benefit to both the consumer and the farmer, but I find that in practice this result has not been accomplished, at least, in this part of the country. After the passage of the act, I had some correspondence with farmers not very remote from the city where I live, and in every instance I found that the attitude of the farmer and his theory of the benefits of the parcel post system were directly opposed to that of the consumer. For instance, the consumer said: *"Now that the parcel post act is in effect, we can get from the farmer our fruits, vegetables, dressed fowls, eggs, etc., with the middleman's profit eliminated, the only expense being the postage, which the farmer ought to be willing to pay."*

Endeavoring to apply this theory personally I found to my surprise the farmer's theory was as follows: *"Now that the parcel post act is in effect, we, the farmers, may reap for ourselves the profit which the middleman has heretofore enjoyed. The consumer ought to be willing to pay us as much as he has been paying the middleman right along."*

In the neighboring city of Providence there are many wholesale fruit and vegetable dealers. In obtaining prices for quite a variety of ordinary fruits and vegetables from farmers within 25 miles of where I live, I found in almost every instance I could purchase the same articles at a lower price from the wholesale dealer and commission house than I could from the farmer. Add to this the fact that the consumer has no selection of the articles shipped, that being done by the farmer himself, and you can readily see that the parcel post is at least a partial failure so far as the elimination of the middleman is concerned. Until some modification or compromise of these conflicting theories of the farmer and the consumer takes place, I see very little to be gained by either one through the introduction of the parcel post. J. L. JENKS.

Rhode Island.

R. N.-Y.—We have heard the same arguments from consumers and from farmers. Both are wrong. There is no reason why a consumer should expect a farmer to sell at retail and charge no more than the wholesalers pay him. Nor can anyone give a reason why the consumer should pay the farmer what he now pays to the middleman. As he now buys the consumer can make some selection and can hold the dealer personally responsible. He cannot do this with a distant farmer. There must be a fair compromise between the two. We have found that 75 per cent. of what the retailers charge gives us at least 30 per cent. more for our goods than we could obtain at wholesale. We have no sympathy with any disposition to "hold up" the consumer to high retail prices. There must be a fair compromise, or there can be no fair argument for using parcel post. These things will come in time. We cannot expect perfection at once.

ARE THE TREES WORTH WHILE?

HERE is rather a new case—at least we have not had it presented in just this form before. One of our readers bought a farm largely because it carried an orchard of about 80 trees. They were good-sized trees of Winter varieties, and this man, who knows little about farming, was told that the fruit from these trees would more than pay the interest on his mortgage, and practically take care of the place for him. After buying the place with this idea in mind, he was told by neighbors that the orchard had been badly injured by careless spraying, putting on the spray solution so strong that it had scorched or destroyed the buds. In Spring these trees made but a poor, feeble appearance, the foliage yellow and scant. They made a puny growth, and gave little or no fruit. Now this man thinks he has been cheated on the same principle as if he had bought a horse which he supposed was sound, only to find him wind-broken or lame when he got him home. This man expected to pay for the farm, or, at least, to take care of the mortgage, out of the income from this orchard, and if the orchard is good for nothing, as he fears, he is prepared to give the farm up rather than lose any more money on it. He wants us to advise him what to do, and whether it is likely that these trees have been permanently injured, or whether it is possible for them to come back. It is easy to see that no one could give even a guess at the matter without a careful examination of the trees. If the trunks are in good condition, and the soil is reasonably suited to them, such trees can usually be revived by pruning, cultivation and spraying. It does not seem probable that the heavy spraying reported has ruined the trees, but the thing for this man to do is to get some expert to study those trees and give him a fair opinion. This is work for the County Adviser or the inspectors from the State Department of Agriculture, and either office would be willing to help. Our advice is to apply to the County Adviser, and also to the Commissioner of Agriculture, at Albany, and ask for expert advice. Agents will come on a request, look these trees over, and give a fair report. This is the kind of service which the Bureau or the Department ought to give, and our friend may be guided by their advice.

A WOMAN AND A FARM.

I WOULD like to get your advice, as I am a woman alone with child 11 years old. I have very little money to work with, but want to live the outdoor life. Could you give me an idea where to buy and what to start with that would be apt to make a sure living? I am healthy and strong; can do any kind of work; am fond of animals and gardening. MRS. F. C.

Long Island.

Think for a moment what a responsibility a stranger takes in giving definite advice in a case of this kind. We know nothing about this woman, and have no means of telling definitely just how she would be likely to succeed on a farm. We do not know whether she has had any experience in farming or gardening, whether she has ever kept poultry or knows of the limitations of country living. No one should take the responsibility of giving direct advice in a case of this kind without further knowledge. It would be a wicked thing to tell such a woman that she is sure to make a good living and more by taking her child out into the country and buying a piece of land. It would be no more than an even chance at best, that she could ever do this. Until we learn more about the exact situation or until we could personally investigate the case, our advice to such a woman would be to try to get a place in the country on some farm or garden, where she could work with her child, and learn something about the business, and also about country living. A strong, healthy woman, as she describes herself to be, ought to be able to get this kind of a position, for good help in the house is hard to obtain in the country. We think it would be possible for her to locate on some fruit or poultry farm, or with some strong gardener, help in the house through the Winter, and in the Spring work more or less out doors with the poultry or crops until she learns enough about the business to know whether she wanted to carry it on or not. In this way she would learn the practical side of the business and probably earn something too. This experience would be a good asset later on. Possibly such actual experience would show her that she did not want to follow country life. On the other hand, it might show her the possibilities of a small farm, and open the way for her to buy or rent one to advantage. Our general advice to those who want to run a farm is to go out first and work as laborers, unless they have already done so, and this advice is offered to all, from the clerk in the store to the graduate of an agricultural college.

THE Agricultural Department Forest Service says: "Range cattle need from eight to 10 gallons of water a day, and sheep from one-half to two gallons, unless there is heavy dew and an abundance of succulent feed. No matter how good the forage on a given area may be, animals must have all the water they need or they will not thrive." This is true of all stock, including humans. Many a man "feels bad" because he does not drink enough pure water.

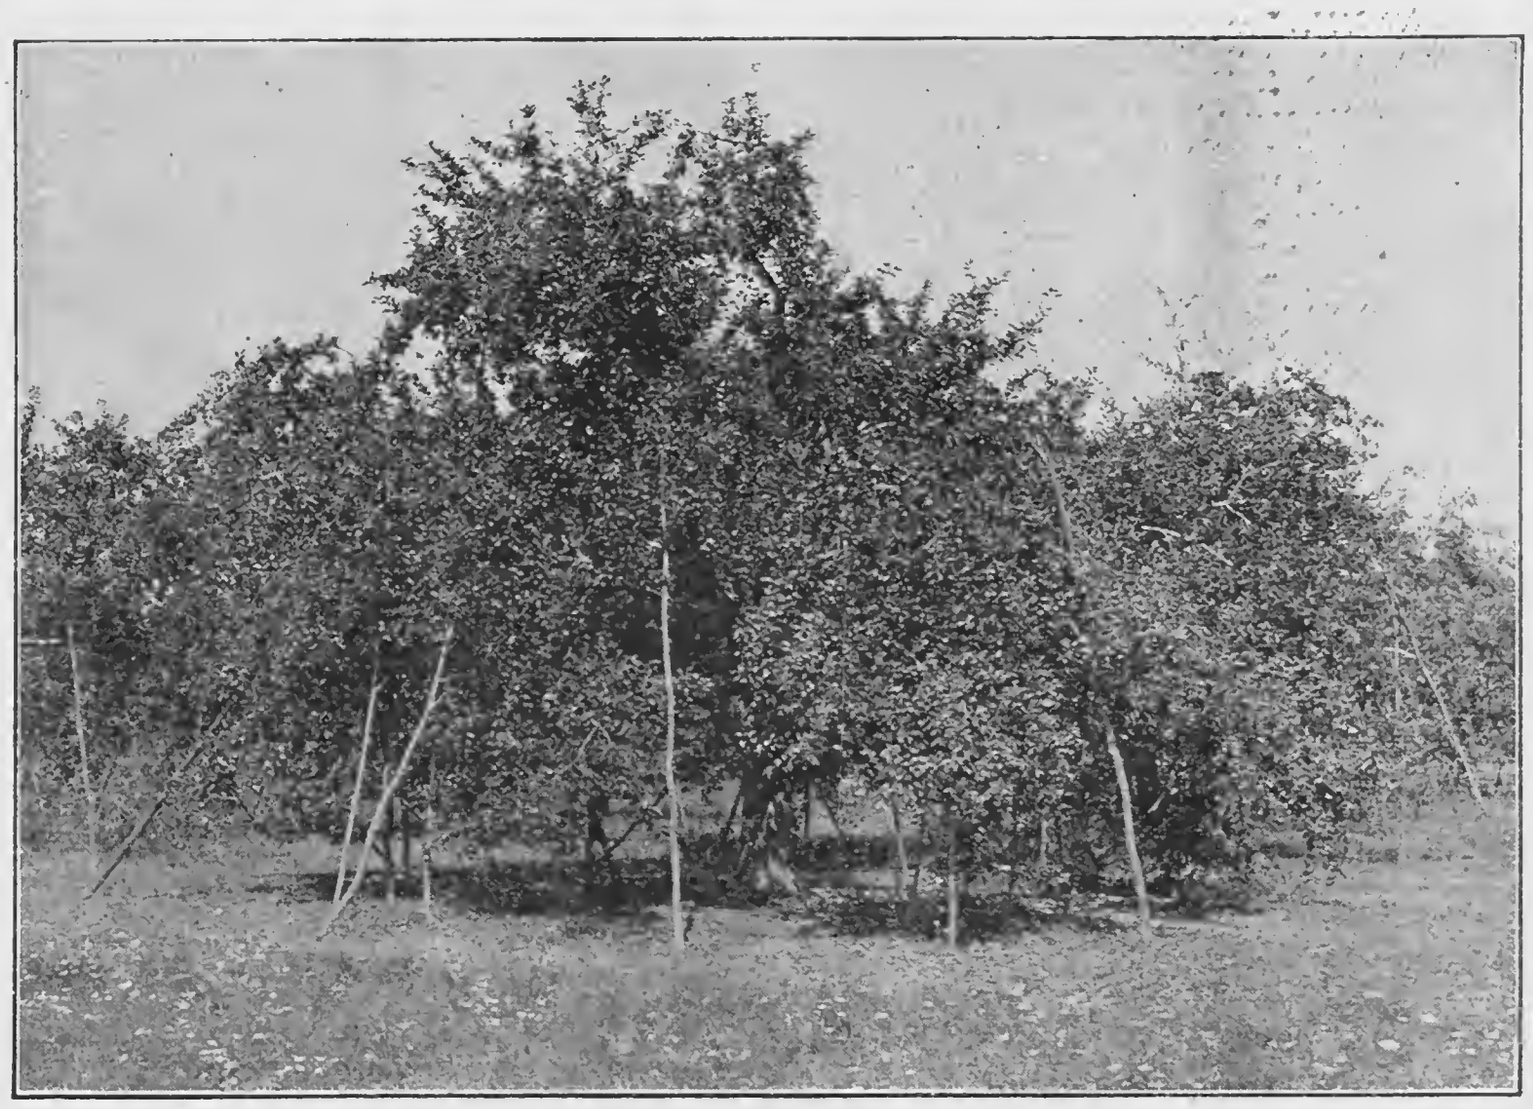
A BUSINESS BALDWIN TREE.

What the Hudson Valley Does in Apple Culture.

DEFECTS IN PRUNING.—The tree shown in Fig. 612, is a Baldwin about 30 years old. It is one of a block of 182 trees planted 35x35 feet, of which 20 are missing from various causes. Standing on the end of a row with a vacant space on one side, it is a little above the average in size and vitality. When I took the orchard in 1909 it was full of dead and diseased wood from scale, canker and collar-rot. We pruned out all the dead and diseased wood and headed the trees back about five feet on top, and thinned them on the sides, working as much as possible from the outside of the tree. The branches were what I call "mule tails." By this I mean that the men in pruning had usually gone up on the main branches and cut the suckers and branches they could reach, leaving a long, naked main limb with a little clump of bearing wood at the end. This system of pruning makes weak branches subject to sunscald and splitting with the weight placed at the end where it can do the most damage.

IMPROVING THE FORM.—We reversed all this. Suckers are allowed to grow on the main limbs and are carefully preserved. We thin them to approximately two feet apart, and head them back half of the season's growth every year. As a rule, in three or four years they change the nature of their growth from the rapid watery growth of the water sprout and become slow growing bearing wood. We thin out and head back from the outside of the tree to let the sun into the center instead of bringing the center out to the sun, and to force the weight of fruit back toward the main trunk as much as possible.

BETTER FRUIT.—The habit of the orchard before 1909 was to bear a very heavy crop of undersized, poorly colored apples every other year. Our aim was to get a fair crop of large red apples every year. The orchard has produced about as follows: 1910, 380 barrels, 2¼ inch and up, and clean; 1911, 500 barrels; 1912, 205 barrels; 1913, 500 barrels; 1914, 419 barrels. That is a fairly uniform production. The pruning acts partly as thinning the fruit does, and while 10 or 12 trees still continue to overbear every other year, the majority are bearing a few nice apples every year. The tree pictured bore 15 barrels in 1913, when the picture was taken, and nine barrels this year, but the difference in size and color often makes the smaller crop the more valuable of the two.



A HUDSON VALLEY BUSINESS BALDWIN TREE. FIG. 612.

SOIL MANAGEMENT.—The soil management has been as follows: Late Fall plowing—in November or December—cultivation once every week or 10 days from early Spring till July 4, and then a cover crop of one-half bushel buckwheat, one-half bushel rye, one quart rape, one-half quart vetch per acre, sown broadcast and harrowed in. This cover crop has never failed to catch and make a heavy growth to turn under and the orchard is gradually coming back to a good state of growth and production.

Columbia Co., N. Y. E. W. MITCHELL.

TYPHOID ON THE FARM.

IT has always been assumed that good health was an accompaniment of farm life and, like stone bruises and freckles, went with the soil. Now, those who are engaged in the occupation of compiling statistics with regard to disease and death tell us that the death rate of cities is falling below that of the open country, or, in other words, that townspeople are living longer than their contemporaries under the open skies. The country doctor confesses to a bit of scepticism with regard to most statistics. He would like to trust them all, but, having seen something of the work of various compilers, he is compelled to take census figures, and the like, with a grain of salt. A single error may not amount to much, but multiply it by thousands and the total is enormous. Did you ever stop to think that if the last census taker didn't get any closer guesses as to the size of your neighbors' flocks than the one you made with regard to your own the size of Uncle Sam's henyard is probably very much over or under estimated? Be that as it may, we are now told that sanitary conditions in well-ordered towns have outstripped in wholesomeness those of the hills, and that we country people are dying sooner, if not oftener, than we should. If this is true, we should bestir ourselves to throw back on the town the onus of being the sapper of health and regain for ourselves the reputation of living up to our privileges in the matter of disease-defying habits.

It is satisfying, and yet a little mortifying as well, to know that many of our most serious diseases are absolutely preventable. Take typhoid fever, for instance, the one particular disease which is now considered characteristically of country, rather than city, origin; it annually slays its thousands, and yet with a care which it is perfectly feasible to take it need not slay any. Until the origin of a disease is known, it is usually impossible successfully to combat it, but when we have traced it to its source we can shut it off right there. We now know that every case of typhoid comes from some preceding case, somewhere, and that it would not have made its appearance had not some one failed to destroy the typhoid germs in the discharges from that preceding case. True, there are a few unfortunate people, known as carriers, who, after recovery, continue to disseminate the germs of this disease for a period of time, but with the proper disposal of the wastes from the human body these need not contaminate the food or drink of others. And it is through food and drink that the germs of typhoid enter our bodies. This has become popularly known and when typhoid breaks out in a family the well usually falls under suspicion. The well may be at fault if it is so situated or constructed that surface water, with its pollution, brought from no one knows where, may obtain access to it, or if some underground channel may carry a portion of the contents of a privy vault into it. But the well on most farms is more safe than the privy, the unscreened, fly-attracting, privy. Here typhoid germs are likely to be found, if anywhere; perhaps deposited there by some chance visitor or by a member of the family with a case of very mild, or "walking" typhoid.

The common house-fly delights in the filth of the privy, and few farmhouses are so well screened that he does not also obtain access to the food of the family. His death-carrying feet leave their unseen prints on butter, pie, and bread, or are perhaps washed in the childrens' bowls of milk. A few germs carried on the dirty feet of a fly rapidly become thousands in number when deposited in warm food or in milk. The responsibility of the fly having become known, its presence, which was once regarded as only a nuisance, is now considered a menace, and intelligent people are forbidding it their premises. Its common breeding places, piles of horse manure, are removed to the fields, and privy vaults are so built and screened that it cannot obtain access to them. Screen doors and windows are now very cheap, and cotton fly netting is still cheaper, so that it is practicable to exclude flies from almost any house if an effort is made to do so. With the passing of the house-fly, typhoid on the farm will diminish and other sources of infection being attended to the coming generation will probably know little of this, the most serious of our fevers.

THE COUNTRY DOCTOR.

SWAMP MUCK AND ITS USES.

I MAIL you a sample of muck of which we have nearby five to six acres, a deposit from two to six feet deep. It looks to me not the common muck, but decomposed vegetable matter. About two feet from the top we found a layer (three-fourths of an inch), of charcoal, just as if a fire had burned the woodland and left part of it. The sample sent was taken four feet from the top down. There is no water at the depth of seven feet now after an eight-weeks' drought, although this muck is very damp. There is no sand or gravel mixed in with it. This muck has been used as a fertilizer by using air-slaked lime with it, and has given good results. The formation of the surface soil is like a giant bowl, never has been cultivated and it is, as all the land here, woodland, pine, oak and maple. This part is cut off now, and has nothing but underbrush on it. The land all around is sand and gravel. Can you give me the value as a fertilizer and how it should be treated as such? R. A. A.

Raymond, N. H.

The "muck" is a sample of brown peat, and from a physical examination seems to be above the average in quality. No one, however, should figure on the values of large quantities of muck without having a careful analysis made. The chief value of muck lies in the nitrogen which it contains. There is very little potash or phosphoric acid as a rule. Samples of muck will run all the way from one-half of 1 per cent. upwards to 3½ per cent. of nitrogen, therefore an accurate analysis is the only safe guide in buying or selling it. This sample would make an excellent absorbent or bedding. On dairy or live stock farms this absorbent value of muck is of great value. Used freely in the stalls or behind the stock it will take up great quantities of the liquid manures, and save large amounts of nitrogen and potash which would otherwise be wasted. The commercial or selling value of such muck is not large. Several firms have tried to put such products on the market, and for a while, through extravagant statements, they have sold some of it. Except for lawns or greenhouses or garden work this muck is not profitable at the high price charged for it, and the chief value of such muck will be for use right on the farm or within a short haul of the deposits. By all means send to the Vermont Experiment Station, at Burlington, Vt., for a copy of their muck and peat bulletin. This gives a very complete statement about this product with many analyses and full description of the best methods of handling. Muck as it comes from the swamp is sour and the nitrogen which it contains is inert and unavailable. It must be sweetened and thoroughly fermented before it will prove of any great value. The best way to handle it is to haul the muck from the swamp and put it in long, narrow piles, where it is to be used in the Spring. To each load of muck scatter about 50 pounds of air-slaked lime as the pile is made up. A good plan is to dump a wagonload over the space about 10 feet long, scatter the lime over this, put another wagonload on top with more lime and so on. If it is possible to throw in an occasional load of horse manure or chicken manure, fermentation is started more rapidly, and the muck will be in better shape. After about three months the pile may be forked over, the workman starting at one end and throwing the muck behind him into a new pile as he forks over the old. To obtain the best results from the muck, a quantity of phosphoric acid and potash should be used along with it, as it is deficient in these elements. Three parts of acid phosphate or ground bone to one part muriate of potash is a good mixture to use with fermented muck. Plow or harrow the muck in and use the chemicals in hill.

To take the squeal out of your wheel apply a bit of grease. It will, of course, give the poor horse Thanksgiving, rest and peace.

A PEACH TREE-GROWING CONTEST IN BERGEN COUNTY, N. J.

WE have all heard of potato contests, corn contests and tomato contests, but never of a peach tree growing contest, and our schools have welcomed it with great enthusiasm. The largest number of applicants in any one school is 160, and the total number of contestants is over 900. These school children will plant and care for trees during the coming year, and the interest in horticulture thus awakened in their young minds, cannot be computed in dollars and cents.

For some time, broad-minded thoughtful people have felt the need of more work along industrial and agricultural lines among school children. Many of them may at some future time in their lives engage in horticulture, and may thus be taught how to combat insects and fungus growth that have become so injurious to the orchards of today. This contest will be directed by County Farm Demonstrator, L. F. Merrill, who has so efficiently conducted other experiments along these lines, assisted by B. C. Wooster, our County Superintendent of Schools. In this contest, all boys and girls who complete the year's work and hand in their reports and essays at the stated time are eligible to place their trees in competition for the prizes offered. It is expected that sufficient funds can be raised in each school district conducting the contest so that substantial prizes can be offered for the best five trees.

RULES AND REGULATIONS.—1. All boys and girls entering this contest must be in attendance at the school or school district conducting the contest.

2. The contest in each school or district shall be in charge of the supervising principal, principal or teacher of that district, assisted by the County Superintendent of Schools (or his deputy) and the County Demonstrator. These will compose the Contest Committee.

3. Each contestant agrees properly to plant and care for one peach tree, which will be furnished by the committee at a cost to the contestant of about 10 cents.

4. Each contestant further agrees to carry out thoroughly and carefully all instructions given as to the planting, pruning, spraying, fertilizing and cultivating of the tree planted.

5. All work must be done by the contestant.

6. All data asked for in the report blank furnished must be given as accurately as possible. This report is due October 23, 1915.

7. With his report each contestant shall submit an essay of not more than 250 words on "How I Made My Tree Grow."

8. All entries must be made by October 23, 1914, using the entry blanks supplied.

9. In the Fall of 1915 each tree upon which a report has been submitted shall be examined, measured and scored by one or more competent judges appointed by the committee. The scoring shall be based upon the following basis:

1. General thrift and condition of tree	25%
2. Freedom from insects and disease	20%
3. Shape of tree	20%
4. Growth, branches, by measurement	10%
5. Growth, trunk, by measurement	10%
6. Condition of buds	15%

10. The final awards will be made upon the following basis:

1. Score, as determined by judges	50%
2. Report, neatness and completeness	25%
3. Essay	25%

AGNES B. CURTIS.

What Fish to Raise.

WHAT kind of fish for eating purposes do you consider the best to stock a pond with? E. L. H.
Pennsylvania.

Before deciding what fish to plant it is necessary to know the Summer temperature at surface and bottom and the character of the bottom, whether muck, mud, sand, gravel or rock. If there are not fish in the pond and the bottom is muck, or there are no water plants growing there, try some of the water to see if it kills fish taken from a stream nearby. Temperature of the water and character of the bottom decide what fish are best fitted for planting in a pond. Bullheads, pike and large-mouth bass thrive in ponds with mud bottom and rather warm water. Lake trout, Rainbow trout, sunfishes, crappies, Yellow perch, etc., want a sandy or gravelly bottom and moderate temperature. The trouts want the water rather cool. Brook trout and small-mouth bass do best in spring ponds with sandy, gravelly or rocky bottom and cold water. Most of the bullheads, catfish or horn pouts are good eating, especially when taken from clear, cool water. The common bullhead and the Spotted catfish or Mississippi cat are better than the Yellow bullhead or Yellow cat. The pike or pickerel is liked very much in some places and considered rather worse than the carp in others. Large-mouth and small-mouth Black bass are very good eating fish, and easily raised in ponds if the conditions are right. Lake trout and Rainbow trout are very good and Brook trout are very fine, but need more care if best results are obtained.

The sunfishes, crappies, warmouth, Rock bass, strawberry bass, Yellow perch, etc., are good pond fish. They are good eating, will grow to good size if not overstocked and need but little care. Many people like them best of all as pan fish. As game fish, simply for the sport of catching them on light tackle, the trouts, Black bass and pike are the best, although the Spotted catfish puts up a good fight in swift water in the Potomac River.

ALFRED C. WEED.

Destroying Dormant Woodchucks.

IS there any method by which I could get rid of woodchucks during the months that they are asleep in their dens, other than by digging them out?
Kennebunk, Me. H. T.

The following plans have been suggested to us, or have been tried by parties we know. During the Winter the woodchucks are dormant. They may be dug out and killed, but this requires too much expensive labor. One way is to wrap a round stone with cloth or cotton batting, and soak this thoroughly with bisulphide of carbon. This liquid evaporates into a poisonous gas. The stone thus saturated is rolled or pushed down into the hole as far as possible. In some cases a sky rocket is pushed as far as it will go down into the hole, and then lighted as it would be outside, or a gun heavily loaded with powder is discharged down into the hole, after which the hole is thoroughly closed so as to prevent the gases from coming out. In other cases a small stick of dynamite is pushed as far as convenient down into the hole and exploded.

"For the Land's Sake, use Bowker's Fertilizers; they enrich the earth and those who till it."—*Adv.*

The Jeffrey Lime-Pulver

Grinds Limestone on the Farm 2 to 3 Tons Per Hour

The day of cheaper lime is here. If you have lime rock available you can make fertile fields of land that is now sick and sour. No need to buy burnt lime at high prices that burns up the humus and wastes the Nitrogen in the soil. No need to buy ground limestone and pay for freight and hauling. Get a JEFFREY LIME-PULVER and, after quarrying the rock, grind it at a cost of 50c per ton. Dig out those rocks that prevent your cultivating your fields and make them enrich your soil—turn the stones into dollars! Grow clover, alfalfa and other legumes by giving your soil the lime it needs.

Saves From $1 to $2.50 Per Ton

It costs most farmers from $1.50 to $3 per ton to get ground limestone on their farm. With a Lime-Pulver you can grind your limestone for 50c and save from $1 to $2.50 per ton. In a short time the Lime-Pulver pays for itself.

Both a Crusher and Pulverizer

The JEFFREY Lime-Pulver is the machine that crushes and pulverizes. It takes big rocks 4 inches thick and 11 inches long and reduces them to powder. Grinds from 2 to 3 tons per hour. The product can be ground coarse or fine. Put it through your spreader without trouble. Crushes rock for road work—grinds corn, tobacco stems, bone, etc. Mounted on wheels—as easily moved as a wagon.

Made in the famous Jeffrey shops. Ball-bearing pulverizer—Pulverizing hammers of manganese steel. Sold on a guarantee of satisfaction or your money back. Write today for valuable booklet, price and full information about home-grinding of limestone.

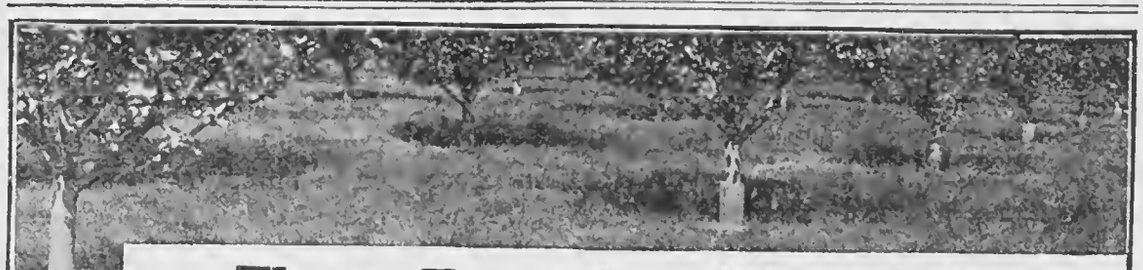
Big Apple Trees
At Little Prices
My apple trees are extra good, with splendid roots, sturdy trunks, well formed heads, and my prices are low for such fine stock. My book tells more about these trees; you may have a copy if you send me a postal today.
SAMUEL FRASER, NURSERYMAN,
124 Main Street, :: Geneseo, N. Y.



These Trees Can't be Girdled

Protect your trees from gnawing and girdling by rabbits, mice and rodents. Use EXCELSIOR WIRE MESH.

It's fine enough and strong enough to keep away all small animals. You can get it in right sizes for all trees, large or small. A tree protector of real substance—something to last for years. Heavy galvanizing makes it rust proof. A most inexpensive protector. You'll be surprised how little it costs per tree. Write for particulars.

Dept. R, WRIGHT WIRE COMPANY, Worcester, Mass.

The Home Acre.

NOTES FROM A MARYLAND GARDEN.

WINTER TOP-DRESSING.—My garden has now been covered with its Winter blanket of horse stable manure. I find that I get better results from covering the soil with manure in the Fall and letting it lie there all Winter, both on vacant spots and as a mulch to the Winter crops of onions, spinach, etc. It is hard to buy any but fresh manure, and hence it is better to have it on the soil months before planting, so that by Spring it is in better shape to feed the crops. While I usually leave it on the surface of the vacant spots, I am this Fall trying the difference on a small part of the garden with turning it under, though I have had fine results from letting it remain all Winter on top.

LATE SPINACH.—In my last notes I stated that the spinach seed sown in August had failed to germinate in the dry weather. I ran out more rows on the same ground and sowed more seed, and to my surprise by the first week in October all of it was up. October gave us such favorable weather that the spinach has made a wonderful growth, and now in early November I have to thin it out vigorously, and having more than we can possibly consume from the thinning process, the grocers are taking it at five cents a pound. The seeds sown early in October have germinated well, and promise to get strong enough to winter over for Spring cutting. I never sow spinach here in Spring, for by the time the Spring-sown is ready the weather is so warm that it quickly runs to seed, while the late Fall-sown crop is cut by the time the Spring-sown plants would be above ground.

STORING FLOWER ROOTS.—My Dahlia roots have been lifted and placed in a shallow pit and covered with a thick layer of old newspapers and the soli then mounded over them. I find that they keep perfectly in this way and far better than in a cellar. Cannas have been lifted too, and stored with all the soil clinging to them, in the cellar, where there is a hot water boiler. I have kept these buried outside, but they sometimes get too much wet and rot. They do better in the warm cellar, and early in Spring they are divided for planting, and some are potted for starting early.

TURNIP GREENS.—Like all Eastern Shore people, we are fond of turnip greens in Spring, and in this month I turn a furrow from each side over the rows, and they keep very well and sprout early in Spring. Late-sown carrots are treated in the same way and taken up for use at any time during the Winter, for we have more times when the soil is clear of frost than when it is frozen, and the carrots seem to get sweeter left where they grew. Years ago, when I was gardening in a much colder climate in the Northern part of this State near the Pennsylvania line, I took up my carrots and set them in trenches just like those used North for celery, and covered the trenches with boards and straw, and they kept well.

SALSIFY AND PARSNIP we leave where they grew of course, for they are still growing, and will keep growing till Christmas; in fact last Winter, January was so mild that these hardy plants grew and increased through the month. While in the North the salsify and parsnips are among the earliest things sown, I have found that here and southward it is better to sow late. In North Carolina I found that early Spring-sown parsnips and salsify were apt to run to seed at mid-Summer and get spoiled and woody. There I sowed them in July, here I sow them in early June, for their best growth is made during the coolor Fall and early Winter, and while the roots may not get quite so large, they are of far better quality.

RADISHES AND DASHEENS.—The Chinese White Celestial radishes are now well mulched with manure. These grow to an immense size, and are very hardy. Boiled, they are far better to eat than turnips, and make quite a new dish. My crop of dasheens has been lifted. I have not tried any of these, as I have been more intent on increasing the stock, but I think I will try a few this Winter. Mr. Collingwood advises to try them on the dog first, but as I do not keep a dog I shall have to try them myself. The growth of the dasheen is very like that of the ordinary Caladium esculentum, but rather taller. The rootlets of the Caladium are pink and those of the dasheen white. The tubers of the Caladium grow much larger, but do not make as many offsets as the dasheen, and the leaves of the dasheen are rather darker green. But as the tubers of the Caladium are very good cooked, I can see no reason why the dasheens should not be good.

AVOCADO SEED.—A friend has sent me some of the big seed of the avocado or alligator pear. I shall try to sprout some of these in the greenhouse merely to see what they look like and perhaps to grow them a while in pots. But fruiting them in pots is out of the question as they make a tree as large as an apple tree. The corms of the Gladiolus are so hardy here that I frequently have some left in the digging that come up and bloom the next year, and the little sets that get scattered in digging grow like wheat in Spring. As I find that many of these little cormlets fail to grow after keeping all Winter, I am trying sowing them in the late Fall, and will sow some of the hard Canna seed also, believing that the Winter soaking will make them germinate better in Spring. Next Spring will tell how these succeed. W. F. MASSEY.

Maryland.

THE MAIL BAG.

A "Versatile Apple Tree."

THE following report is floating through the papers:

Hart, Mich., Nov. 7.—One of the interesting exhibits at the county fair was a display of 84 varieties of apples picked from a single tree. This exhibit was made by G. W. Haight. Haight has done some experimenting with a tree that was originally a Tallman sweet. He now has the tree grafted to 135 different varieties of apples. This is believed to be the most versatile tree in the country.

Can anyone give the record of a more "versatile" tree than this one?

Taxing Cats.

WE understand that Ocean County, New Jersey, is going to impose upon its citizens a tax of 50 cents for every male and $1 for every female cat that they own. Is it right and proper for a State or county to impose such a tax on its people and protectors of health and property? P. F. J.

Lakewood, N. J.

R. N.-Y.—There must be some mistake about this. The County Clerk of Ocean Co. writes us that he never heard of any such tax. Efforts to impose such a tax have been made in a number of States and towns.

Returns from Grapes.

By 7,570 lbs. grapes, avg. 3 6-7c lb.	$93.38
By 64 qts. grape juice for home use.	
To plowing, pruning, tieing and hoeing 2 times	19.00
To picking, use of team, time to market grapes	100.00
Net profit for use of land	$174.38

Vineyard contains 1¼ acres (by measure). Grapes sold direct to consumer on street and at stand in city market house in Altoona and suburbs, population 75,000. Varieties Concord, Brighton, Worden, Catawba and Niagara. Vineyard is old and was grown up with locust and briars until three years ago. Between grape rows we raised a plentiful supply of all garden truck for two families. H. A. E.

Altoona, Pa.

SLAT AND WIRE FENCE.—I remember to have seen, years ago, a fencing made of lath as pickets secured in order and position with three or four lacings, or weavings, of two strand wires. Because of its vertical flexibility, by which it would conform to uneven ground, the lightness and portability of this fencing, my impression is that it would be quite ideal for yarding very small chicks, affording as it would splendid protection against enemies and against winds, because of the closeness of the laths in their order. Can you give me the information sought, namely if such a fencing is now made anywhere, and if it is by whom?. A. H.

Flushing, N. Y.

R. N.-Y.—Some 25 years ago there was a craze for this kind of fence. Many "machines" for weaving the wire around the slats were advertised and many miles of fence were put up. What has become of them? As the woven wire fences came into use the slats disappeared. Are they still made?

WHAT KIND OF LIGHT FOR YOUR FARM?

The four kinds in the pictures are all in use on modern farms. Three of them are unreliable. Troublesome, unclean, and cause fires.

Electric Light operated by the Edison Electric Light Plant is by far the most practical and economical and the *safest*. The.

Edison Storage Battery

is the *only* one with a four-year guarantee of full-rated capacity. No internal cleanings or testings needed. No repairs or renewals. No waste of time, patience or money.

1895 Oakland Av., Kansas City, Mo.

EVENTS OF THE WEEK.

DOMESTIC.—John T. Hall, said to be the composer of several songs and marches and president of the John T. Hall Music Publishing Company, at 2 Columbus Circle, New York, was arrested, Nov. 13, on a charge of having used the mails to swindle thousands of amateur poets. He was arraigned before United States Commissioner Clarence S. Houghton and released on $5,000 bail. Hall, it is alleged, between August 1 and October 20, conducted a prize lyric contest, in which he offered prizes of $250, $150 and $50. Post Office Inspector Mayhew says Hall turned over the lyrics to the Knickerbocker Harmony Studios, which were then in West 42d St., and that the latter charged the entrants $10 each for writing suitable melodies. Besides running the contest, Inspector Mayhew says that Hall has been promising ama'eur poets—one of them a scrubwomen—large amounts in royalties if they permitted him to arrange the music and business details, paying him from $35 to $40 for the privilege. From his contest Hall is alleged to have realized more than $15,000.

As a result of a federal investigation of the Sanden Electric Company, of 1261 Broadway, makers and distributers of a "cure-all" electric belt, two members of which were indicted in June for fraudulent use of the mails, the Post-office Department has issued a fraud order against the company. The Sanden concern is one of the older industries of its kind in this city to fall into the government net, having done a thriving mail order business here and abroad for more than twenty-five years.

Twelve hundred indictments have been returned in Pike County, Ky., on charges of election frauds, and as many more men are expected to be indicted before the Grand Jury finishes its investigation. A similar inquiry will begin soon in Letcher and other counties, it being alleged that the frauds were general throughout that judicial district in the election two years ago. The investigation is the most sweeping since that in Adams County, Ohio, three years ago, when more than 3,000 voters were disqualified for similar practices.

Five persons were killed and five injured, one seriously, when the general store of Noah Kanaza, at Superior, Pa., was blown up by dynamite, Nov. 15. The store and five dwellings were burned, entailing a loss of $25,000. The dynamiting is believed to have been the work of men who had threatened Kanaza, who is wealthy.

The Federal reserve banks of the new currency system opened Nov. 17. The new system permits the expansion and contraction of the money supply of the country in keeping with the actual needs of business, whereas the old system maintained the same amount of the circulating medium for all seasons and all financial situations. It authorizes the issuance of currency upon the security of commercial paper, with a generously broad definition fixed for this collateral. It provides twelve reserve banks around which the banks of the country are grouped with a central directing authority vested in a governmental body at Washington, the Federal Reserve Board, which can mobilize the resources of any or all of the individual districts to meet any extraordinary need for the circulating medium in any one district. No adequate method of mobilization was provided by the old system. It releases automatically, by decreased reserve requirements, more than $400,000,000 cash and credit reserves. Summarized, the effect of the newly organized system, according to officials in Washington, will be to prevent panics.

Jared Flagg, the 52-per cent. investment broker, was sentenced, Nov. 17, in the U. S. District Court at New York, to 18 months in the Atlanta penitentiary for his frauds. Pending an appeal he was released under $50,000 bail.

The State presented the basis of its case against Henry Siegel, charged with the larceny of $684.05 from the National Bank of Commerce, at Genesco, N. Y., Nov. 17, through the expert testimony of John Flint, a certified public accountant, who after a personal examination of the books of the Fourteenth Street Store said that there were discrepancies amounting to almost $2,000,000 in the credit statement of the store submitted to the bank on February 1, 1913, for a loan of $100,000, which the bank granted. Flint testified that the assets of the store in that statement were overestimated by $359,750.14; that the store's liabilities were understated by $491,748.80, and that the books of the store showed liabilities, undisclosed in the statement, amounting to $1,008,820.08. All told, these discrepancies amounted to $1,860,329.02 for this Siegel concern alone. Flint's examination of the inventory of the Fourteenth Street Store showed that in 1913 fifty-one departments lost nearly $400,000. Only four of the departments showed any profit at all and one of these was a profit of $12.

THE EUROPEAN WAR.—Nov. 13 Premier Asquith announced British casualties up to that date were 57,000. .....Nov. 14 it was reported that two German submarines were destroyed in the English channel.....Premier Asquith asked the House of Commons, Nov. 16, for an additional credit of $1,250,000,000 for war purposes. This is the greatest single demand ever made upon the nation, and in addition to the money already voted in August is equal to a 50 per cent. increase in the national debt. The new amount was voted unanimously in almost record time. The larger part of the $500,000,000 already obtained for war purposes has been expended, Premier Asquith told the House, and Great Britain is now spending $5,000,000 a day. Great Britain has lent to its allies $215,000,000, of which the largest single amount, $50,000,000, was to Belgium. Servia has borrowed $4,000,000. On these two loans no interest accrues until the end of the war. Other loans were made to the self-governing dominions of Canada, South Africa, Australia and New South Wales. Under ordinary conditions these countries would have to borrow their money in the London market.....Nov. 15 it was announced that the British superdreadnaught Audacious had been hit by a German mine, Oct. 27, off the north of Ireland; that her entire crew had been rescued by the White Star liner Olympic and that the Audacious was then sunk by the British authorities to remove her from the track of navigation.....Field Marshal Lord Roberts of Kandahar, known to the whole British Army as "Bobs," died suddenly of pneumonia, Nov. 14, in France. He was retired from active service, his age being 82, but had gone to the front to visit the Indian troops. He was the idol of the British Army, and the recipient of the highest military honors, winning the Victoria Cross in the Indian Mutiny, and distinguishing himself in numerous campaigns in Asia and Africa. .....Severe fighting still continues along the Yser, and there is no further evidence of German advance. Frightful conditions prevail; incessant fighting continues, while snow, severe cold and floods add to the miseries of both troops and refugees.....British light cruisers are again coöperating with the troops, bombarding Belgian coast towns held by the Germans.....Russian reverses are reported at Stalluponen and along the Vistula. It is also reported that Turkish troops defeated the Russians at Koprukol.....An Indian force, assisted by warships, has defeated the Turks at the head of the Persian Gulf.....Nov. 17 Turkish forces fired at a launch from the American cruiser Tennessee at Smyrna. An explanation has been requested by Ambassador Morgenthau.....

FARM AND GARDEN.—The Department of Agriculture has quarantined Clinton and Franklin counties, New York, on account of the existence of powdery scab among potatoes there. This action was taken after a public hearing on the matter held November 13, and became effective on November 16. Technically the Department has quarantined the whole State, but through the cooperation of the local authorities in quarantining the two infected counties it will be possible for the Federal Government to remove all restrictions upon the movement of both table and seed stock from the area outside of these two counties. The provisions of the quarantine are in general identical with those in force in Maine. Potatoes intended for food must be grown in soil that is uninfected and must have been stored away from all diseased stock and must be found upon inspection by Federal authorities to be absolutely free from any traces of powdery scab. They are then tagged and can be moved in interstate commerce.

Pasteurization and other safeguarding methods adopted by the national commission on milk failed of indorsement by the American Association for Study and Prevention of Infant Mortality at its session, Nov. 13. The principal speaker in opposition to the commission's plan was Dr. Henry L. Colt, of Newark, N. J., who said: "My twenty-five years' experience teaches me that medical commission control is not the solution. I have eliminated from my parlance pasteurization and have substituted the word 'refined.' Abroad they cook milk almost universally. In Holland they heat milk to 102 degrees centigrade, for otherwise, they say, they would get typhoid fever from the dikes. We must educate our people to do their refining of milk in the home."

The National Wool Growers Association, in convention at Salt Lake City, Utah, sent resolutions to Secretary Bryan asking him to stop trying to lift the British embargo on Australian, New Zealand and South African wool, claiming the American industry would be injured. The Administration is asked to place a tariff on wool, in view of the closing of woolen mills in Europe, as protection against South American goods.

The Connecticut Sheep Breeders' Association will hold its annual meeting, with attractive speakers and an exhibit of wool and dressed mutton, in Unity Hall, Hartford, Conn., Dec. 15. The public is invited to attend. This is the week the Connecticut State Board of Agriculture usually holds its annual Winter meeting, but they have abandoned their meeting this year for the first time in nearly 50 years.

Dr. Simon Flexner, director of the laboratories of the Rockefeller Institute for Medical Research, is in Chicago to attempt to isolate the germ which causes the hoof-and-mouth disease in cattle, and then to prepare a serum which will immunize cattle in advance. He is working in coöperation with Dr. S. E. Bennett of the United States Bureau of Animal Industry. The quarantine was extended, Nov. 16, to Connecticut and Montana, making 16 States now under quarantine.

STEEL PRICES ARE ADVANCING!

But You Can Still Buy Direct from Our Mill at the Old Price

Steel prices have struck Rock Bottom and are now going up. We bought heavy stocks of raw material at the lowest price in years and now give you the full benefit. This is your opportunity. You will never again be able to

BUY HIGH-GRADE GALVANIZED STEEL ROOFING AS CHEAPLY AS YOU CAN RIGHT NOW

Grasp this opportunity before our prices must advance! Send at once for our prices, samples of roofing, and complete roofing book giving full line of designs, and instructions for measuring and applying.

We pay the freight and **we guarantee** every sheet to be full weight, first quality, extra-thick, extra-tight galvanized coating—**or it does not cost you a cent.**

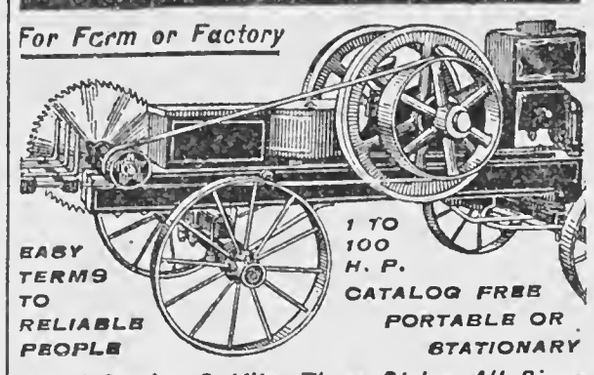
Gasoline Engines

For Farm or Factory



EASY TERMS TO RELIABLE PEOPLE

1 TO 100 H. P.

CATALOG FREE

PORTABLE OR STATIONARY

Wood Sawing Outfits, Three Styles, All Sizes

MAKE MORE MONEY—DO LESS WORK

YOU need on your farm an engine that starts when you want it to and that keeps going until the work is done. That means EXCELSIOR. Hundreds of farmers who have used the best other makes say they never knew what a real engine could do until they bought the EXCELSIOR, but we do not ask you to take any man's word. We say, "Try the EXCELSIOR on your work without the payment of a cent until you are satisfied that it is what we say—the best running, most durable, and most economical engine you ever saw. If we do not prove that to your satisfaction, send the engine back." You can have the engines on wheels with saw attachment or without or on skids, and we make all sizes from 1½ H. P. up. Tell us the size of your farm and how big an engine you need and get our offer. Write today for catalog and other information.

R. CONSOLIDATED GASOLINE ENGINE CO.
202 Fulton Street New York City

Make Money Trapping

Lots of sport and there's money in it. **FUR NEWS**, published monthly, tells all about trapping, hunting, raw furs, fishing, hunting dogs, guns, ginseng, fur farming, woodcraft, and all pursuits for profit in forest and field. Lots of good stories. **SPECIAL.** Send 5c for sample copy and liberal offer to new subscribers.

Soil Improvement Notes

Soot as Fertilizer.

WE are often asked about the value of soot or chimney cleanings as fertilizer. Some of our readers live near factories where this soot can be obtained for little money. It contains considerable nitrogen, and usually fair quantities of lime and phosphoric acid, and is useful for garden crops, although used alone as a fertilizer it would not be very satisfactory. It makes a good dust for putting on melon or squash vines to repel insects. It is also used around cabbage and similar crops for the maggot. Some gardeners who desire to quicken up their land so that they may plant it earlier use the soot to attract the heat. A dressing of soot on the land, a light soil in particular, will warm it up considerably and in some cases give a chance to work it several days in advance of the uncovered soil. The dark color of the soot absorbs the heat on the same principle that the black clothing is found warmer in Winter than the white clothing naturally worn in the Summer.

Value of Filter Bed Deposits.

WHAT is the value of the deposits from the filter beds which receive drainage from city sewers? Would it make a good fertilizer for tobacco? Connecticut. A. E.

The deposits from sewage filter beds are quite uneven in quality. Sometimes, in dry weather, the material is almost a dry skim, which is removed. At other times it must contain 50 per cent. or more of moisture. Without ever having tried it on tobacco, I should not advise its use. It is certainly a fairly good manure for general farm crops, to which I think it should be applied, rather than to tobacco, where so much depends on that obscure thing which we call "quality." E. H. JENKINS.

Sweet Clover.

YOUR correspondent who writes over the initials C. H. K. undertakes to read me a lecture on the value of Sweet clover for Maryland. I have not the slightest objection to his advocating it for Ohio, but down here we have plenty of better forage crops and soil improvers, and as I said, we do not need the Sweet clover. It grows wild here, five or six feet high, along neglected ditch banks and roadsides, and as I have said, I have seen cattle in a field where there was a rank growth of the Melilotus alba along the ditch banks, eating the grass and severely letting the Sweet clover alone. Down here we can grow cow peas in Summer and Crimson clover in Winter, and can make big crops of Soy beans. Where the Crimson clover will not stand the Winter, the Sweet clover will have value, but here, as compared with the crops we can grow of the legume genus, we do not need the Sweet clover, and farmers in colder sections are right in using it, and are perfectly welcome to it so far as we are concerned. We prefer crops that cattle will eat without any starving into it. We can make crops of cow pea hay, which is far better than the Melilotus, and can make Alfalfa too, and cut it three or four times in a season. We can grow a crop of Winter oats heavier than Spring oats are grown in Ohio, and on the same land, the same season, can get a crop of cow pea hay, which the veteran Henry Wallace told the Iowa farmers is as good, ton for ton, as Alfalfa, and after the cow pea hay is cured we can get the same land in Crimson clover for the Winter and turn it under and make a big corn crop in the Spring, sow peas among the corn, and turn them down for a big Winter oat crop in the Fall. And we could not do all this with Sweet clover instead of the peas and Crimson clover. Hence we do not need the Sweet clover, except that where it grows wild it will inoculate the soil for Alfalfa. W. F. MASSEY.

Plants Affected By Lime

THE Geological Survey in referring to lime deposits in this country says:

"Thus, some of the common plants which are stated by the Department of Agriculture to be benefited by lime, are spinach, lettuce, beet, celery, onion, cucumber, cantaloupe, asparagus, cabbage, peanut, rhubarb, pea, pumpkin, bean, tobacco, Alfalfa, clover, barley, wheat, oats, Timothy, gooseberry, currant, orange, quince, and cherry. Indian corn is only slightly benefited. Plants which are said to be slightly injured by lime are cotton, tomato, cowpea, Concord grape, peach, apple, and pear, and those really injured are radish, flax, blackberry, black raspberry, and cranberry."

One of the crops not so well understood in this relation is corn. This crop is usually selected for a sod and lime is frequently used with it. The truth is that corn does not respond to lime, though some flint varieties endure it better than others.

Applying Lime in Fall.

I HAVE ordered a car of burnt lime to use this Fall. I intended to put it on top of the wheat in November (my wheat is up now and looking well) but I have been told that it will burn the phosphate that I have drilled with the wheat; that if I use it as I intended to do I shall get no benefit from the phosphate at all. I would like to use the lime; I thought I might get a better stand of grass in the Spring by using it this Fall. What is your opinion?

Henderson Md. T. P. R.

We never had much success in using lime in this way. Lime ought to be worked into the soil—not left on top. The danger of destroying or "burning" the phosphate will not be great now—some time after seeding—but the chances are that you will not be satisfied with the results of such liming.

WANT TO KNOW.

The Sorghum Sugar Business.

THE price of sugar has gone to 10 cents per pound, and this has started some of us in this section to thinking about sorghum as a partial substitute. I feel sure that you or some of THE R. N.-Y. family can give just the information we want. Are the small horsepower crushers and "cook" pans advertised by the mail order houses satisfactory where the business is carried on on a small scale? If so are copper pans enough better than galvanized iron to justify the added expense? About how many gallons of syrup could be produced per acre on land capable of producing 50 bushels of corn per acre? We have in this section three distinct types of soil, sandy upland (bright tobacco land), red clay upland and alluvial bottom land along the streams. Which kind would be best suited to the production of sorghum for syrup? I have grown sorghum for feed on our red hill land, and it makes a good growth and gets very sweet. I want to start the business in the simplest, most inexpensive way that will produce good syrup. Any suggestions as to best practices in boiling and swimming, "running off" the syrup, etc., will be appreciated, also any information as to growing and handling the crop.

JOHN B. LEWIS.

Brunswick Co., Virginia.

I HAVE a small quantity of medium wool, about 200 pounds, which is hard to dispose of as dealers want larger lots. Can you put me in touch with any mill that will make it up into horse blankets or other goods suitable for farm use, on shares or for pay. G. E. A.

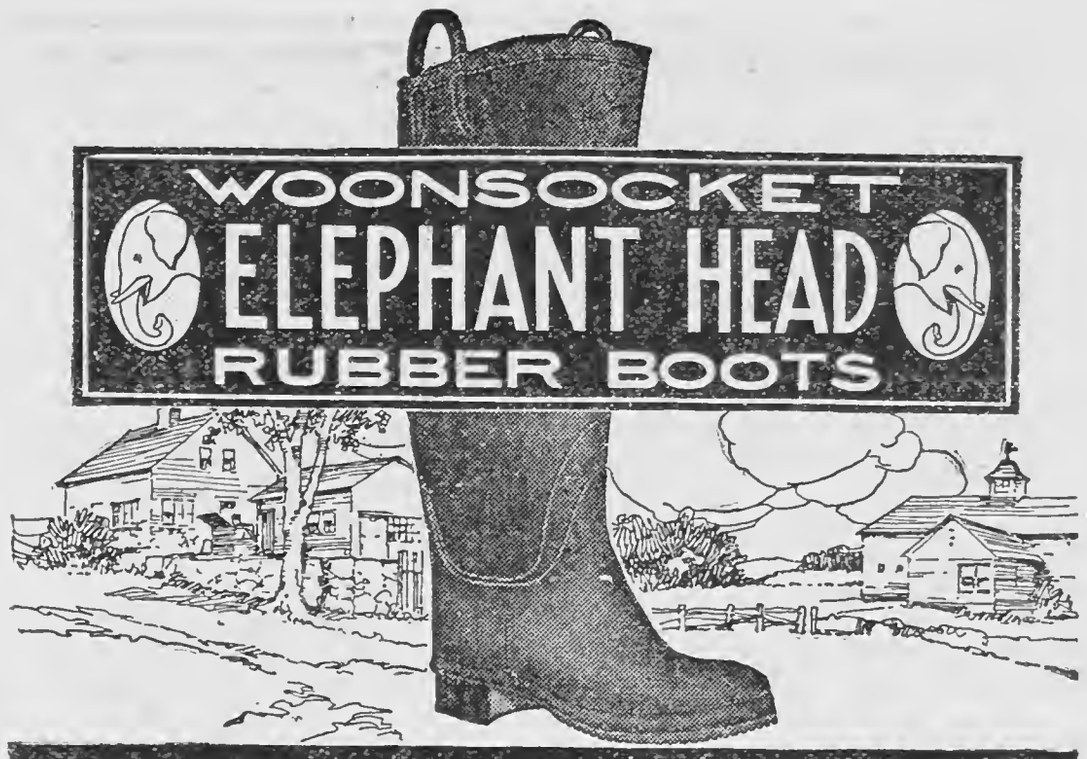
Long Island, N. Y.

Paint Brushes and Hair.

A FEW things not generally known about paint brushes are told by U. S. Consul Johnson of Kingston, Ontario:

"The Canadian paintbrush makers are experiencing difficulty in adjusting selling prices to the present cost of the basic material. Bristles from a semiwild hog of Russia and Siberia and also a black hog of China have advanced 50 per cent. since war was declared, on account of the practical stoppage of shipments from those countries. Other hairs used in brush industry are also scarce. Camel hair is dressed only in Germany; the trade of dressing this very fine and short hair requires great skill. It is not known where it can be secured when the present supply is exhausted. Badger skins from which the badger hair is obtained comes entirely from Russia. The advance in this article is nearly 100 per cent.; in fact, it is not a question of what one has to pay, but whether it can be bought at any figure. Germans and others in and around New York City have been dressing bear hair in large quantities for the past 10 years and as a result the Canadian trade is not obliged to purchase in Europe. Ox hair, generally called Siberian ox hair, comes from the inside of cows' ears. These ears were formerly taken to Germany, where the hair was cut out, the skin used for other purposes, and the gristle of the ear used for gelatine. During the last few years the dressing of cows' ears has been done in the United States."

THE brother aged five years, was taken in to see his new baby sister. Upon viewing the baby's red face, he exclaimed: "Aw, it's an Indian!" The nurse assured him it was not, whereupon he replied: "Well, if it's not an Indian, all I got to say is, then it's spoiled."—Chicago Tribune.



Buy Elephant Head Rubber Boots—

1st. Because they are made of only pure, live, durable rubber and are perfectly waterproof and stay so longer than other boots.
2nd. Because they are made of highest quality selected tested duck, and so wear longer than other boots.
3rd. Because they are triple reinforced at every joint and seam, and so do not split, rip, nor tear.
4th. Because they are lined with soft wool net, and so do not chafe nor cause corns, callouses and blisters.
5th. Because they are made by the largest Rubber Company in the world, and have been tried and found right by millions of farmers.

All the better dealers sell ELEPHANT HEAD RUBBER BOOTS. You can depend on anything you buy in the stores that have them.

WOONSOCKET RUBBER CO., Woonsocket, R. I.

Silo Forms Were Used For This Circular Concrete Milk House

This concrete milk house, on the dairy farm of O. G. Sherburne, near Coldwater, Mich., was built with the same forms which contractors had used in building two 14x40 silos for Mr. Sherburne. Farmers who are having silos built can profitably use the roof and wall forms for a concrete milk house.

Mr. Sherburne's farm buildings are typical examples of the progressive farmer's preference for concrete structures. Twelve years ago his place had practically no improvements. Today it is a model dairy farm, with buildings permanently constructed of concrete.

Whenever you buy cement for concrete work, be sure to ask your dealer for

Hope Farm Notes

THIS week there are so many questions on hand that we ought to answer them as we can:

I notice, on page 1313, "Peaches for Columbia Co., N. Y." your correspondent states, "We shall not put any more peach trees as fillers among apples, as we have become convinced that Wealthy or others of that shape are much better." I am interested in knowing whether this is true because the peaches do not do particularly well in Columbia County, or whether he finds the apple fillers more profitable aside from the fact that peaches do well. J. B. M.
Lodi, N. Y.

I seem to be the "we" in this case. No more peach fillers for me for the following reasons. 1. Peach and apple require different feeding, spraying and handling. We try to force the peach into early bearing, for its life is short at best, while the apples are to remain for years and we prefer a slower solid growth. Forcing the peach not only stimulates the apple, but gives it a poor shape. The big spreading peach tree soon fills out its space and the apple trees begin to climb up straight in the air—just where we do not want them. True, you can cut them back and bring them down, but they will not be well-shaped trees. We have ample evidence of this in our orchard. The Wealthy apple tree makes a thin, rather small, head which does not interfere so much with the permanent trees. It gives us 10 crops or more before it is necessary to cut or dig out. The peach may give five crops. The Wealthy sells well as a Fall apple with us. 2. Spraying. The apple trees must be sprayed at blooming time with some form of poison. Do the best you can, and yet more or less of this spray will be blown upon the peach trees. If you use enough poison to benefit the apple trees your peach trees are burned—in some cases quite severely. There are still other reasons why I do not plant peach and apple together, yet I recognize the fact that some growers argue in favor of the practice. I will let them give their own arguments.

In a general way would you advise sowing rye on muck land, the rye to be plowed under the following Spring, or would you prefer to have the muck lie idle during the Winter, which would subject it to frost action? The muck is now plowed. What would be the advantage of sowing rye under such conditions? H. K. C.
New York.

This question was answered by mail in late October. It is, of course, too late to sow rye now. I should, however, in such a Fall as this, sow rye up to Nov. 1. While it would make but little growth above ground it would fill the soil with its roots, and in this way open it up more than the frost alone would do. Then the rye starting to grow in early Spring would help dry out that muck soil and fit it better for Spring plowing than if there was no living crop on it. Then also the living rye crop plowed under and limed would start ferments in that soil which the muck alone could not do.

I am much interested in the Hope Farm man's endeavor to induce apple growers to advertise their fruit instead of complaining of the badness of the market and indifference of the buyers. I enclose an advertisement to show the method we are following on our farm. I do not think either growers or buyer have yet woke up to all the possibilities of parcel post. In packing for mail we find it advisable to use a corrugated lining paper in the boxes as well as the usual paper and layer board and not put up a pack of more than 120 to the bushel. With smaller apples the box will probably go over the 50 pound limit, though some varieties of course weigh less than others. It is perhaps unnecessary to add that only perfect fruit is packed.

"APPLES BY MAIL."

"Best quality Baldwin or Greening Apples packed in standard Western box, sent post paid on receipt of $2.50, check, stamps or money order. Order now for Thanksgiving and Christmas."

Mailing limits Utica, N. Y. and Portland, Me., Burlington, Vt., and Paterson, N. J. Beyond these limits we send by freight prepaid. E. P.
Massachusetts.

This appeared in a daily paper published in a city of about 100,000 people. Our own advertising is in a town of about 1,500. It has sold all our Baldwin apples already, and I am now trying it with Black Ben Davis—stating exactly what this variety is. I do not see what more we can do to show fruit growers the possibilities of the local town trade. A little advertising right in your home paper will sell most of your goods if you will pack them honestly and well. People write us asking where they can sell their apples when right in their own town are dozens of people who would gladly buy. The local paper is the best place for your local advertising. You can now send 50 pounds by parcel post. Our own fruit is about all sold already, and we could easily have handled 500 barrels more. Why not buy and sell again? We want to make it a strong point that we handle only our own produce—picked and packed here. In the end that will pay us best.

A few years ago there was quite a discussion in THE R. N.-Y. over a statement which the Hope Farm man made about a cow becoming drunk eating apples. Well, that same question came up last night in a class discussion and the teacher vowed that he had seen it. Now as we remember it the scientific men held to the theory that it was an impossibility. We feel from our experience on the farm that such a thing is an utter impossibility, at the same time it is one thing to be convinced a thing is right and another to prove it. If the thing held true with cattle it would be equally true with humans, and from what we have seen in the way of boys eating apples we think most of the boys on farms in the apple section would be confirmed topers by the time they were 18 years old, also with hogs. Our hogs always run in the orchard, and they simply gorged themselves with apples, but there were no tipsy swine, that is sure. C. I.
New York.

The Hope Farm man has his feelings like all the rest. There are two subjects which start these feelings into language, which has to be check-reined and blue-pencilled. One is the thought of the time I bought a couple of bathing suits at a big New York store. These suits were for my two big girls, and at the store I was referred to a couple of "salesladies" who went into close details regarding my purchase. Never again! The other matter is this one of "drunken cows." Some years ago I came home to find the good old family cow flat on the barn floor in a dull stupor. She had filled up on half decayed apples. The hired man had some ice and was packing it around the cows head. Now while I never tasted much rum I know the smell of it, and I know that the stall where that cow lay smelled like the street in the western town where a reformed saloonkeeper smashed in the head of a whiskey barrel. Knowing the habits of the hired man I gave him the discredit until the local cow doctor came and said the cow was "drunk." Then I thought on further examination that an appology was due the hired man.

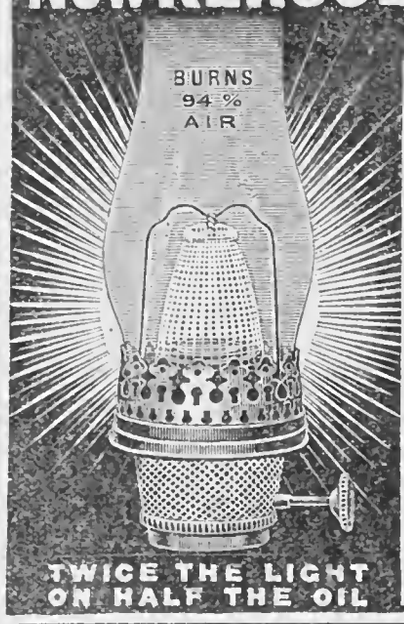
I mentioned this incident and a number of scientific men scoffed at the idea. The chemists, some of them experts at brewing, said it was impossible—that the temperature of the cow was too high to permit the formation of alcohol and so on. I thought at the time that these gentlemen never saw a cow after a feast on apples, but their scientific guns were too much for me. It was like those great German guns smashing the walls of Antwerp.

Then came our old friend, Dr. Smead, on the other side. He showed that a cow has four stomachs—one of them capable of holding two bushels, more or less, of apples. These apples are not chewed like the rest of the food, but remain in this great paunch at about the temperature suitable for distilling. The chemists told what ought to happen in the laboratory. Dr. Smead told what would most likely happen inside the cow, and I thought he showed the possibility of this alcohol formation. No use comparing a man, a hog or a horse or anything else that carries a single stomach with the cow. Her great paunch or storage tub certainly puts her in a class by herself when it comes to a distillery. I am obliged to confess that I lack the scientific knowledge required to argue with the chemists. At the same time the hired man and I still think that cow was "full"—I reasoning from observation—he arguing from experiences! H. W. C.

AN old lady sat knitting in her armchair when a young girl burst in on her. "Oh, grandma," she said, "father has just fallen off the roof!" "I know, my child," the old lady answered placidly "I saw him pass the window."—London Evening Standard.

New KEROSENE LIGHT BEATS ELECTRIC OR GASOLINE

10 Days FREE—Send No Money



We don't ask you to pay us a cent until you have used this wonderful modern light in your own home ten days, then you may return it at our expense if not perfectly satisfied. You can't possibly lose a cent. We want to prove to you that it makes an ordinary oil lamp look like a candle; beats electric, gasoline or acetylene. Lights and is put out like old oil lamp. Tests at 14 leading Universities show that it

Burns 50 Hours on One Gallon

common coal oil (kerosene), no odor, smoke or noise, simple, clean, won't explode. Three million people already enjoying this powerful, white, steady light, nearest to sunlight. Guaranteed.

$1,000.00 Reward

will be given to the person who shows us an oil lamp equal to the new **Aladdin** in every way (details of offer given in our circular). Would we dare make such a challenge if there were the slightest doubt as to the merits of the **Aladdin? GET ONE FREE.** We want **one user in each locality** to whom we can refer customers. To that person we have a special introductory offer to make, under which one lamp is **given free.** Write quick for our 10-Day Absolutely Free Trial Proposition and learn how to get **one free.**

MEN WITH RIGS MAKE $100 TO $300 Per Month Delivering

the ALADDIN on our easy plan. No previous experience necessary. Practically every farm home and small town home will buy after trying. One farmer who had never sold anything in his life before writes: "I sold 51 lamps the first seven days." Another says: "I disposed of 34 lamps out of 31 calls." Thousands who are coining money endorse the Aladdin just as strongly.

No Money Required

We furnish capital to reliable men to get started. Ask for our distributor's plan, and learn how to make big money in unoccupied territory.

MANTLE LAMP COMPANY, 670 Aladdin Building, Chicago, Ill.
Largest Manufacturers and Distributors of Kerosene Mantle Lamps in the World

NOTES FROM THE FLOWER TRADE.

IT is generally conceded that prices for cut Chrysanthemum flowers will not again reach the high level of former years, as public taste has become educated to refinement of beauty rather than size alone. One large grower told us that his highest price this year was $6 a dozen for the early show blooms, as against $9 in previous years, and this price quickly declined to $4. Up to the middle of November $2 to $3 a dozen for exhibition varieties, and $1.50 down for commercial single-stem stock were average prices in New York. There is an increasing taste for the single, pompon and anemone types, which are cut in sprays, and sold by the bunch. This shows an improvement in public taste, and gives an opportunity for charming effects in decorative work. It is not a get-rich-quick scheme for the grower; these sprays were quoted about the middle of November at 10 cents to 20 cents a bunch in New York, though they were higher earlier in the season. However, every florist heaves a sigh of relief when Chrysanthemums go out, and though a number linger into December, Thanksgiving Day usually marks the end of their formal season. Among single sorts grown commercially are Ceddie Mason, crimson; Mary Richardson, reddish salmon; Margaret Totty, golden yellow; Dorothy Dann, amber; Golden Star, yellow with orange disk; Merstham Gem, old rose with yellow disk; Cecil Denyer, white. Showy anemone pompons are Citrinus, buff; Gladys Spaulding, amber; Garza, large, pure white; Junon, blush pink. There are many fine new varieties in these classes, and among the button-like pompons.

During the height of the Crysanthemum season Gardenias were sold on the streets for 10 cents each, although they were quoted about 60 cents to $1 a dozen wholesale. This beautiful and fragrant flower used to be grown in a moderate temperature, which produced the natural short-stemmed flower resulting from a stocky, shrubby growth, but it is now given more warmth, which results in a large, highly finished bloom that can be cut with a fairly long stem.

Violets, both double and single, were bringing 20 to 40 cents per 100 early in November, and 10-cent bunches were plentiful on the streets of New York, either violets alone, or made up with Sunburst roses. The latter, beautiful rich yellow, were quoted at 50 cents to $5 a hundred, the cheap small buds finding their outlet with the street peddlers.

The list of florists' roses now on the market is much larger than formerly. Among those quoted early in November were Beauty, all the way from 50 cents to $12 a hundred; Killarney 25 cents to $3; Killarney Queen and White Killarney, 25 cents to $4; My Maryland and Richmond 25 cents to $3; Lady Hillington, a beautiful yellow, 50 cents to $4; Prince de Bulgarie the same; Mrs. Aaron Ward 50 cents to $5, Mrs. Charles Russell, 50 cents to $6, and Jonkheer J. L. Mock, one of the newer sorts, 50 cents to $8. These wide price variations are due to quality, for when demand is slow the poorer grades are forced down to the street peddlers' level.

Orchids always hold an aristocratic place though some of them get very plentiful later in the season. Cattleyas were $10 to $20 a hundred, Dendrobiums $20 to $25.

Carnations do not look up in price until after Chrysanthemums are gone; they come into competition in many lines of utility trade, nor are carnations at their best at this season, so they went from $1.50 per 100 down, for the great mass of market flowers.

It is interesting to notice that one courageous New York florist has opened a branch store in the new public market at 130th. St. and North River. Flowers are a noticeable feature of public markets abroad, and should be appreciated by American buyers also.

THE Sunday school teacher had explained the familiar Bible story at length, and then asked Tommy if he expected to be among the sheep or among the goats. "I dunno," said Tommy doubtfully. "How's a feller to tell when his ma calls him a lamb and his pa says he's a confounded kid?"—Melbourne Leader.

PEACH AND APPLE QUESTIONS.

IN the planting of a five-acre apple orchard should I plant mostly of McIntosh, Baldwin, Wagener and Wealthy? How about McIntosh, and how many Delicious can I afford to risk planting? Where shall I buy genuine Delicious trees? 2. What about the J. H. Hale peach for Michigan? What do you know about the Early Elberta peach? The Michigan nursery agents are knocking on the Delicious, the J. H. Hale and the Early Elberta. R. L. J.

Thompsonville, Mich.

1. The varieties of the apple mentioned are all well suited to Northern Michigan. McIntosh is not a late keeper, nor is the Delicious, yet they are both of good quality and color, and the trees bear well. Do not be afraid to plant them both, and I would advise to use them for about half the proposed orchard as the permanent trees, which should be 40 feet apart. The Wagener and Wealthy are both good bearers at an early age, and should be used as fillers in the 20-foot spaces. The trees will not last long because of their heavy bearing. The Delicious trees, as sold by all the nurseries offering them, I believe to be true to name.

2. The J. H. Hale peach is a good one for Michigan, ripening about the same time as Elberta, which it closely resembles. Early Elberta is much the same in every way except that it is earlier and in this respect it is decidedly better for Northern Michigan, where some of the late peaches are not suitable, as I know by many years of observation there.

H. E. VAN DEMAN.

Gulf State Figs.

ADDING some notes or comments to the article "A Fig Proposition—The Latest," (page 1310) would say that it is no doubt a scheme to unload some land. As to the "mule" type fig grown hereabouts, the reasons the fig "is today a back-yard and fence-corner tree" are that every darkey, also the "po' white trash" that cares to, can have a fig tree or more, for they are so easily propogated, begin to bear the first or at least the second year, furthermore are not much subject to insect or bacteria enemies, nor need intensive culture, but simply to be let alone and they will grow like Topsy did. Also Alabama, Mississippi and Louisiana are, at least were, in the thralls and bondage of cotton, rice and sugar cane, and had no time, no inclination, nor incentive to grow figs, nor was the variety (Celeste), mostly grown, adapted to growing on an extensive scale. Also there are very few local canning factories to take care of the fresh fruit. The fig is the fruit par excellence of the Gulf Coast country but wants moist, rich soil and to be let alone. There are many varieties, but the Celeste is mostly grown. Of late years the Magnolia has been planted extensively in the Texas Gulf Coast district, for canning, and in the neighborhood of Jennings, La., the Cary is being grown for shipping north in a fresh state. T. M. R.

Louisiana.

Defective Golden Bantam Corn.

IN my opinion, the "something" which Golden Bantam corn requires (page 1313) is careful selection of the seed for a few generations. This is comparatively a new variety for which the demand is increasing and seedsmen would be even less than usually careful in selecting seed for sale, and even for their own planting might use poorer ears than they would in the case of varieties of which the sale is about the same year after year. If W. P. M. will save his seed, taking only perfect ears from stalks bearing two or more ears, he will find in a few years that Golden Bantam bears fewer defective ears than any variety he can buy from a dealer. ALFRED C. WEED.

New York.

SUBSCRIPTION: ONE DOLLAR A YEAR

To foreign countries in the Universal Postal Union, $2.04, equal to 8s. 6d., or 8½ marks, or 10½ francs. Remit in money order, express order, personal check or bank draft.

Entered at New York Post Office as Second Class Matter.

Advertising rates, 75 cents per agate line—7 words. References required for advertisers unknown to us; and cash must accompany transient orders.

"A SQUARE DEAL"

We believe that every advertisement in this paper is backed by a responsible person. We use every possible precaution and admit the advertising of reliable houses only. But to make doubly sure, we will make good any loss to paid subscribers sustained by trusting any deliberate swindler, irresponsible advertisers or misleading advertisements in our columns, and any such swindler will be publicly exposed. We are also often called upon to adjust differences or mistakes between our subscribers and honest, responsible houses, whether advertisers or not. We willingly use our good offices to this end, but such cases should not be confused with dishonest transactions. We protect subscribers against rogues, but we will not be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent to us within one month of the time of the transaction, and to identify it, you should mention THE RURAL NEW-YORKER when writing the advertiser.

IT is quite a common saying at farmers' institutes and other Winter gatherings, that in some milk-producing districts the milk check equals the feed bill, and no more. What they mean is this: Milk farmers are paid once a month by check. Their account at the feed store is charged up until their milk is paid for. When the milk check comes they turn it over to the feed dealer, who gives them the balance if there be any. Now can anyone tell us of actual cases where the monthly milk check is no larger than the feed bill? Can such cases be shown, or is this largely figurative talk put out as an argument against poor stock or poor feeding? If anyone can tell us of actual cases where the feed costs as much as the milk brings in we shall be glad to analyze them.

*

THE farm owner and the farm manager! Should the latter take some of the financial risk and be prepared to make the farm pay or not draw full salary? This is a big question which has come up for discussion, and there are many sides to it. The problem will be of especial interest to young college men who offer their services as farm managers. Following our usual custom in such matters we print the first letter received from a college man endorsing the proposition. Is it fair?

I have completed a four-year course in the agricultural college, following several years of working a small fruit, vegetable and poultry place on shares. My proposition is that acting as working foreman I shall receive the regular hired man's wages, i. e., $300 a year and keep, and half the labor income from the farm, i. e., half the profit from the farm, after paying all cash expenses, and interest on the investment at 5 per cent. This is I think a fair proposition for both sides. I get only wages for manual labor, and then place my knowledge against the investment of the owner, and divide the results. FRANCIS W. WARDLE.

*

A FEW weeks ago you stated that Eastern rye contains garlic and this sells for a low price. Are you sure about this—and do you think it right to say so? S. B. K.

Our authority comes from one of the largest and best milling companies in the East, as follows:

We think, from a price point of view, every effort should be made to eliminate garlic from Eastern rye. For instance, Jersey rye sells here at 80 cents, New York delivered, as against 96 for Western rye, same terms, and only because the Jersey rye contains garlic. The berry is large, and in fact superior to the Western on account of color and weight, but our mills and other handlers cannot use it until such time as the garlic dries and can be blown or screened out. We will send you a sample of Jersey rye containing garlic in a day or so.

So much for the fact. Now is it right to tell the truth about our rye? Let us ask our friend what we or he would gain by silence or denial? He cannot sell his rye for more than the "Jersey" price, while it contains garlic. The only hope to obtain the extra 16 cents a bushel is to clean out this foul stuff.

*

A FEW years ago one of our readers ordered an outfit of apple trees from a New York nursery. He wanted certain high quality varieties and paid a high price for the trees. This year they began to come into bearing, and he knew they were misfits—just what he did not want. So he sent samples of the fruit to this nursery. He received the following, which we do not hesitate to characterize as a fool letter:

We are in receipt of your letter of recent date. In reply will state on account of there being so many varieties of apples, therefore it is as a rule guesswork on the part of most men who pretend to know the names of different varieties of fruit, but we discover it is a splendid variety.

The apple is Ben Davis—there is no question about it—the merest beginner at fruit culture would recognize its shape, its stripes and its sawdust flavor. The ostrich with its head in the sand—kicking at the air—is a Solomon compared with this man who sees a plain Ben Davis and discovers it to be "a splendid variety."

SOME of the big New York stores are offering a good apple free to every purchaser of 10 cents worth of goods. They also sell boxed apples. This is a taking offer, and attracts a long string of customers. There are thousands of country towns where the same thing would work out. Some merchant might handle the crop for several fruit growers, and it would pay to give away 20 per cent. of the apples in order to advertise the rest. And do not hand out the little wormy fruit as samples. Such advertising, right in your town, would dispose of the fruit and boom the merchant's trade. We have no doubt the Western fruit growers are giving away thousands of boxes of apples just to advertise their goods. You must give something in order to take. The Bible tells us "*There is that scattereth and yet increaseth.*"

*

THE Percheron horse breeders and the gasoline tractor makers have been having a discussion regarding the merits of flesh and bone or gas power. They need not worry—there is more than room for both. This European war is wasting horse flesh like smoke. Not only are working horses being destroyed, but the famous breeding herds of Belgium and France are being scattered. The world must look to this country both for working horses and for draft breeding stock. It is doubtful if there are enough good horses and mules in the country to-day to supply the export demand. We think many a farmer will buy a tractor and sell his draft colts at the prices which the latter will bring. War wipes out business habits and prejudices. Up to the Civil War the Devon cattle were very popular in the Gulf States—particularly Georgia. When Sherman marched through the State these beautiful red cattle were slaughtered by the thousand, and the State never went back to beef production. Cotton monopolized farming and the Jersey finally came in as a dairy cow. In like manner war seems likely to injure the business of breeding draft horses in Europe. It will not recover for years, and during that time this country must supply the world with heavy horses.

*

JUST now there is much being said, and no doubt with good cause, relative to the cattle disease that seems to be so prevalent throughout the country. What about deer? Are they not as liable to the disease as cattle, and will they not scatter it over the country pretty thoroughly? They roam at will over our fields and pastures. Massachusetts is one of the quarantined States. I live near the Massachusetts-Connecticut line. One can see from one to four deer almost any day grazing on my Alfalfa and rye. Is there not danger of their bringing the disease to my cattle? H. J. I.
Connecticut.

The disease attacks all cloven-footed animals so that deer are susceptible. If deer feed with affected cattle they will become diseased and spread the disease; not otherwise. In any district where diseased cattle have run the deer would be likely to contract the disease and scatter it all over the country. The disease has been found in Massachusetts and Rhode Island, and this gives a new side to the deer nuisance. There is considerable criticism of the Department of Agriculture for permitting this disease to gain headway. If it was suddenly discovered at Chicago during the National Dairy Show it must have been there or nearby before. Why was it not discovered, and why were the dairymen not notified until their high-priced and rare cattle were sent to be exposed to it?

*

THERE is trouble in New York City over the employment of aliens on public work at digging the new subways. This work is done by contractors who hire their labor as they can. There is a section of the State labor law which bars the employment of men who are not American citizens on public works:

Section 14 of the labor law requires that on public works "only citizens of the United States shall be employed," and that preference shall be given to citizens of this State. Moreover, each contractor is required to keep a list of his employees, in which it shall be shown whether they are native or naturalized, and, if naturalized, when and where they were naturalized. Violations are punishable by fines of from $50 to $500 or from thirty to ninety days' imprisonment, or both, and forfeiture of contract.

This has been the law for 17 years. It was designed evidently to protect American labor by reserving all public work for men who are citizens of this country. Local courts are divided as to whether such a law is constitutional. It has been considered a dead letter for years, and contractors have employed many aliens. There are said to be 18,000 of them now at work in this city. The labor unions now threaten to stop work if contractors do not comply with the law. The usual answer to such threats is that it will be impossible to find native Americans to do this rough work of digging sewers and subways. In the cities this work has gradually fallen to the lot of aliens. The law does not affect farmers.

AT the egg-laying contests, just now starting, it is the general remark that the birds are of a better laying type than in any previous contest. Greater care has been taken in selecting. The visit of Tom Barron and the discussion of utility type have set breeders to thinking and studying as never before, and they are coming nearer agreement regarding the shape and appearance of the utility bird. The "standard" breeders have had things pretty much their own way heretofore. Now "utility" is coming.

*

DO childless professors know more about rearing children than their parents?

That is the hot and indignant question we get from a parent who finds the efficient local school broken up and "consolidated." Why, bless your heart, the "childless professor" usually carries about with him all there is to know about children. It is, however, a case of quantity against quality. His vast store of wisdom is drier than a Ben Davis apple until it is flavored by the real love and experience of father and mother. The "childless professors" are, most of them, doing their best to give us a set of human cogwheels and nothing more for the next generation.

*

A YOUNG man whose home is in Mexico City has for two years conducted a private class in Spanish. His work makes a neat addition to his income, as well as keeps him in constant practice in the Spanish language.

This comes from the Kansas Agricultural College. We shall be asked at once what possible good can ever come from teaching Spanish at an agricultural college? As a matter of fact there are great trade opportunities for us in Mexico and South America which cannot be developed except by agents who are familiar with the Spanish language and character. Over 25 years ago efforts were made to prepare for this great trade. Our people were very willing to sell in their own way and at their own price, but they could not at that time appreciate the fact that the South Americans must be approached in their own language and through a study of their own peculiar habits and views. Americans would not understand these things, but the English, Germans and French saw at once that trade is extended through "human nature." The result was that Europe gained the trade which this country should have had. The Germans have been particularly active in gaining this trade, and their great success led to one of the causes for the present terrible war. If 25 years ago the people of this country had been wise enough to prepare systematically for this South American trade there would not have been an idle factory or an idle farm anywhere near the coast. Our opportunity has now come through the dreadful losses of this war. It is only an opportunity, for our people must follow the business methods of Germany and England if they expect to gain this trade. We think therefore that the study of Spanish at an agricultural college is a wise and useful thing—certainly of equal value to the study of German and French and far more useful than the dead languages.

BREVITIES.

Too much "boosting" leads to "busting."

THE average bedroom is kept far too warm. It ought to be cold and fresh while you sleep.

WE are now told on good authority that continued feeding of ground wheat to horses will cause an irritation of the skin almost equal to mange.

THE Kansas Agricultural College claims that State does not need potash. Well, the rest of the country needs the vast amount of potash in your corncobs if you do not. Cob ashes would bring good money.

NOW Louisiana is to have an "Orange Day"—November 19. You would hardly think of oranges grafted on the boll weevil, yet the ruin wrought by that hideous insect drove Louisiana planters to oranges.

THE Russian government has placed an embargo on all kinds of lumber, to prevent its exportation; walnut lumber, including Circassian walnut, much prized by American furniture makers, is specifically mentioned.

THIS comes from the U. S. Forest Service: "It is said that the German invaders of Belgium, whatever else they may have destroyed, have been careful not to injure park trees. The cavalrymen, so a report goes, are forbidden to tie their horses to trees for fear that the animals will gnaw the bark. Germany was the first nation to apply forestry on a large scale."

THOSE of you who have struggled with quack grass will be interested in these figures from the North Dakota Station. They were trying to see how much quack root must be left in the soil for growth: "Of 16 one-inch pieces six grew; of 26 two-inch pieces 19 grew; of 13 three-inch pieces 12 grew; of 13 four-inch pieces all grew; of eight six-inch pieces all grew.

THERE is often great neglect of the hen while she is molting. That's the time she needs your best care. The New Jersey Station says: "Feathers require considerable fat or oil in their formation; furthermore, the oil in the feed tends to make the new feathers slick and smooth, giving them a bright luster. Oil meal, Soy bean meal and sunflower seeds are among the best materials to supply this much-needed ingredient."

RURAL SAVINGS AND LOAN ASSOCIATION.

THE Rural Saving and Loan Association received its charter from the State last week, and it is now open for business. The charter members are largely those who are connected with THE R. N.-Y. office, but two farmers and one city party have become members. Loans of the money on mortgages of the association can be made only within a radius of 50 miles of the office; but loans on the shares can be made anywhere; and any person, no matter where he or she lives, may become a member.

There are five kinds of shares:

1. Instalment shares, on which the member pays 50 cents a month on each share.

2. Saving shares, on which the member pays in what he likes from time to time, as much or little and as often as he likes, until the payments and earnings amount to $100, when the amount may be withdrawn.

3. Accumulation prepaid shares on which a single payment of not less than $50 per share is made, at the time of subscription. The earnings are added to the payments until the share is worth $100, when it may be withdrawn.

4. Income shares, on which $100 must be paid at the time of subscription. The earnings on these are paid in cash.

5. Juvenile shares, on which minors may pay as much or as little as they elect from time to time.

The accumulations may be withdrawn at any time on a 60-days' notice; but the directors may waive notice, and payment is then made at once. The 60-days' requirement is simply a safeguard in case of withdrawal by a member after an investment of all the funds has been made. In such cases the first collections are used to pay the withdrawing member.

Our ambition is to cover the whole State with these associations, so that every home in the State will be within 50 miles of an association, and consequently within the radius of a loan. The Land Bank will probably be ready for business within a few weeks, and every association will then be in position to get ready money for its members. When the law was passed we hoped to sell the bonds at a very low rate of interest and to make loans on a correspondingly low rate, but the European War scare has made money hard to get, and rates will necessarily be higher than before the war broke out. The beauty of the system is that money can always be had for just what the market rate is at the time. Just now the rate is high; but when it is low the mortgage creditor will get the benefit of it.

We will accept membership in the Rural Association from any quarter by mail in the hope that when the members get acquainted with the system they will withdraw and organize an association in their own neighborhood. We will always be glad to help the work in any such case. J. J. D.

NEW YORK FARM EXHIBIT TRAIN.

A THREE-CAR demonstration train, showing the agricultural possibilities of New York left Albany, N. Y., November 2, and will be on the road until December 16, the route being through New York, Ohio, Indiana and Illinois, stopping at 43 towns, where the public will be admitted to see the exhibits and moving pictures and hear the addresses. One car contains N. Y. State apples, another a variety of N Y. State products, all labelled with the grower's name, yield per acre, and net price to grower, and the third a private car.

In the moving picture exhibit there are 2,000 feet of film, photographed within the last few months, showing farming operations and scenery in the State, and in addition to this 1,000 farm photographs.

The aim of this agricultural special is to show the Middle West an accurate picture of conditions in the Empire State.

THE NATIONAL GRANGE MEETING.

PART I.

THE National Grange met in forty-eighth annual session at Wilmington, Del., on Nov. 11, and adjourned Nov. 20. The work of the past year was reviewed by National Master Oliver Wilson of Illinois, and in point of new Granges organized, namely 490, it was the most successful year since 1873. The finances of the order are also in good condition. It is proposed now to make a permanent investment of $100,000 in bonds of first mortgages and using only the income therefrom for current needs. The receipts last year were about $4,000 more than for 1913, and the total resources are $99,992.34. Mr. Wilson also reviewed the legislative work of the order for the past year and outlined the policies of the Grange for the year to come. Among these policies are increased federal aid for road improvement, conservation of our natural resources, effective regulation and control of all transportation companies, a fair and equitable system of farm credit and national prohibition of the liquor traffic.

Among the multiplicity of questions which the Grange finds interest in and that affect the farmer directly or indirectly, rural farm credits, good roads, financial coöperation, woman suffrage, government ownership of telegraph and telephone and taxation stand out in bold relief. And yet the diversity of opinions on most of these questions is noteworthy, and yet not surprising when it is borne in mind that the Grange covers the entire country, and the interests of one section are by no means the same as those of another. Perhaps the wonder is that the Grange is as successful as it is in defining policies that are capable of being worked out where conditions so radically differ. Take for instance farm credit. The West needs money at a lower rate of interest, because no farmer can afford to pay eight and 10 per cent. and make money if he has to borrow much. The West is therefore particularly interested in the money question. But all sections will agree that it should be possible for the farmer to procure money if he needs it at such rates as will not discourage investments in agriculture. Relative to Government aid in this matter the so-called Buckley-Hollis bill which emanated from the joint committee of the House and Senate, seemed to meet the ideas of the legislative committee of the National Grange the best of any, and yet that did not go so far as would the Grange, for it would insist that more substantial Government aid should be included in the bill to steady interest rates and uphold the market for farm mortgage bonds. No farm credit bill will be acceptable to the National Grange nor meet the fullest needs of agriculture, which places in the hands of private capital the power to make interest rates on mortgage bonds without limitations by federal law.

There is, it seems, a proposition on foot in the Post-office Department to contract the rural mail delivery service to the lowest bidder, as was the case with the star routes, in place of giving fixed salaries to the rural carriers. The Grange declares "its unalterable opposition to this hazardous plan of operating the rural mail delivery system." It also has an idea that all limitations on the amount of deposits in the postal savings banks should be removed and that such deposits should be loaned direct to farmers, thus forming a kind of farm credit system and thus to aid in the establishment of rural credit.

The question of placing greater restrictions on immigration in the future when the European War shall have ended, had the attention of the Grange. The national master, in his opening address said: "The applicant for citizenship should be required to be able to read and write the English language and stand a rigid examination in the Constitution of the United States and that of the State where he seeks naturalization." Perhaps the Grange would not go quite so far as this, but it would throw such safeguards as are needed around naturalization, in order that only the desirable class of immigrants may become citizens of this country.

In 1916 the Golden Jubilee of the organization of the Grange will be celebrated, and it is quite probable that that celebration may take place in New York State in connection with the annual meeting of the National Grange. The fact that the first Subordinate Grange was organized at Fredonia, N. Y., would seem to be one reason why the 1916 session should be held in this State. Proper effort can secure it. A committee will report to the next annual session an outline of program for the 50th anniversary. In this connection it may be said that some suitable memorial to the late Oliver H. Kelley, one of the founders of the order, will be devised, probably a fund for the extension or educational work of the National Grange.

The next session of the National Grange will be held in California, probably at Oakland. J. W. D.

THE NEW YORK APPLE LAW.

NEW YORK apple growers have this year opened a new era in packing their fruit by statute regulations. The new practice has been both criticized and commended. Many growers have failed to accept the provisions of the new law, and have sold in bulk to local dealers. Others have hailed the law with delight as a new means of carrying on their practice for years.

State Inspector Wheaton, of Canandaigua, recently passed through Wayne County, looking after the packing methods in vogue here. He stated that general compliance was being made with the new statute, and that for the first year the results were proving satisfactory. Only one case had been reported under his jurisdiction as coming in repeated violation to the law, and this one may lead to a court affair. Complaint in this case came through a middleman. The packer was traced up and warned, after which a second offence occurred. In one barrel the inspector selected 32 quarts of cider apples. Such infractions of the law, however, have been very rare.

In commenting upon some of the opposition to the new law, B. J. Case, ex-president of the New York State Fruit Growers' Association, made the following statement: "It seems to me, as an apple grower, that this law is one of the best that we have ever had in this State to govern the packing of any food commodity. All it calls for is that apples shall be branded what they are. The great trouble with Western New York apples has been that a lot of inferior apples were placed in the middles of the barrels and the barrels were marked "fancy Western New York apples." This has given our apples a bad name in all markets, and the people who were trying to pack their apples honestly suffered severely from the reputation of all Western New York apples caused by dishonest packing. I cannot see why anyone should object to having his apples marked exactly what they are as to quality and size. According to this law any kind of apples or any quality or size of apples can be packed in barrels and shipped into the market. The only provision is that they shall be marked on the heads of the barrels exactly what they are. It has been the slogan of the Western New York Horticultural Society and the New York State Fruit Growers' Association, that 'there is a market, at a profit, for every apple grown in Western New York, if every apple was put into the grade to which it belonged and sold for what it is.'"

It was hardly anticipated that the new regulatory measures would take effect without some form of protest by growers not alive to their own best interests. The law is established and unless all signs fail will go far to give back to New York fruit its former prestige.

A. H.

The Situation in Evaporated Apples.

AS the season advances more evaporators and cider mills are opening up to care for the great surplus of apple stock. In the market for evaporated fruit there is little activity. Stocks are everywhere more than equal to the demand and quotations are not easy to obtain. To a large extent the present condition is due to the complications in Europe, the natural outlet for a most important bulk of the apples evaporated in the East.

In the face of the present discouragement neither the drier operators nor the dealers are losing faith in the situation. The finished output is rapidly piling up and the warehouses are doing all in their power to care for the receipts. If Europe is not to count as a consumer this season, radical changes must be made to place the crop elsewhere and already steps have been taken to secure these ends. It would appear from communications received from Havre and Hamburg dealers, that the outlook is not at all favorable in Europe. The Havre letter is as follows:

"We do not know what to say with regard to our dried fruit contracts. First of all, we doubt whether you could ship, even if you wanted to. Secondly, we do not know whether we could, under existing circumstances, receive the goods; and, thirdly, we do not know how we could manage to pay for the goods. We have the money here in actual cash, but the banks are unable to help us in any way, and they do not want to take on any business. It is impossible to buy an exchange in America, and we cannot transfer any money to our friends there, as the banks cannot do it. The banks will not give letters of credit, and, under the circumstances, most business is at a standstill. Our friends in America say they cannot sell their exchange on France and ask us to pay in America. So there the matter stands, and, in the meantime, the business has stopped. We cannot communicate with our buyers. Letters to the interior take a week to reach destination and often never reach there at all. Telegrams take about the same time. So we are out of touch altogether with the interior."

A letter from Hamburg, dated September 15, to the California Fruit News, comments as follows on the German situation:

"On account of war, so far as business is concerned, we are in a very unfortunate position and the end cannot be forseen. Personally we have done nothing since the war started. At the outbreak of hostilities a little business was done with dried fruits by dealers who had goods of old crops on hand, and these were sold at fabulously high prices, many sales being made to the War Department. A few cars of the 1914 crop also were received just before the war broke out, but these have already been sold, and people in our line have nothing whatever to do at this time. Most of the young people have gone to the war, and those who have not gone to the front are engaged in Red Cross and other similar service. The situation here is greatly aggravated through our being shut off from other countries, especially America. We can with difficulty correspond and we cannot cable or receive cables at all. Two of our largest houses here got together a few days ago and decided to open a branch in Copenhagen, from which city cable connection can be had with America without hindrance and mail connection is much easier. This idea has not yet become generally known to the trade, and I have only just now received the information confidentially of the prospective establishment of the system. So far as taking care of all contracts is concerned nothing whatever is being said yet. No one will discuss the matter, as it is an international question, and we must necessarily wait and see what other countries do. According to the exact wording of the law in Germany, however, delivery under Fall contracts is possible even after the present difficulties are over. A contract once made cannot be canceled by one party alone. Accordingly it is possible that September-October contracts may yet be delivered in December, should the way be open. The only question is, what position the importers will take on this and whether or not the government will establish a moriatorium in this matter."

To what extent foreign conditions reflect on the home market is shown by the volume of trading. Fancy evaporated stock is quoted at 10 to 10¼ cents with almost no business. Choice rules at 9 to 9½ cents, with very slow movement. Trading for the last few days has been in small lots only. Prime stock is quoted at from 8 to 8½ cents, with movement a little better than the other grades. Futures are doing a little better so far as demand is concerned, but the market is still badly demoralized, and 4½ cents seems to be outside, f. o. b. State for November delivery. Future chops are quoted at 1¼ to 1⅜ cents for prime, loose in barrels, f. o. b. State. No spot goods are available and the only sellers are a few who have scattered small lots to dispose of. Waste is quoted at 95 cents to $1 per hundred pounds loose in barrels, f. o. b. State. Demand for futures is not active, and very little is sold under present conditions. A. H. P.

Ten Months' Export.

DURING the 10 months ending with October, were exported:

	Bushels.	Value.
Corn	8,403,635	$6,578,230
Oats	22,738,564	12,262,465
Wheat	125,189,486	127,536,062
	Pounds.	
Fresh beef	12,494,769	1,647,714
Pickled beef	18,402,761	1,815,626
Bacon	143,313,752	19,801,423
Hams	119,135,714	17,318,125
Lard	356,865,416	39,656,597
Pork	32,200,286	3,543,639
Cotton	2,256,794,570	262,628,680
Flour	262,817,802	44,380,742
	Gallons.	
Gasoline	172,765,067	21,248,660
Fuel oil	585,037,687	15,781,220
Crude oil	104,328,686	4,283,368
Machine oil	162,366,273	21,982,457

Government Crop Report.

THE government estimates in early November give the following crop figures with comparisons, the figures referring to bushels unless otherwise indicated:

	1914.	1913.
Corn	2,705,692,000	2,446,988,000
Wheat	891,950,000	763,380,000
Oats	1,139,741,000	1,121,768,000
Barley	196,568,000	178,189,000
Rye	42,644,000	41,381,000
Buckwheat	17,025,000	13,833,000
Potatoes	406,288,000	331,525,000
Sweet potatoes	56,030,000	59,057,000
Apples	258,682,000	145,410,000
Flaxseed	15,973,000	17,853,000
Hay, tons	68,604,000	64,116,000
Cotton, lbs.	7,341,000,000	6,772,000,000
Tobacco, lbs.	982,715,000	953,734,000

The average per acre yield of corn is 25.8 bushels; wheat, 16.7; buckwheat, 21.4; potatoes, 109.6; sweet potatoes, 94.5; tobacco, 853.8 pounds.

The weights of measured bushels of grains were: Wheat, 58 pounds; oats, 31.5; barley, 46.2.

Average farm prices November 1 were: Corn, 69.7; wheat, 96.2; oats, 42.5; barley, 51.3; rye, 80.6; buckwheat, 88.1; potatoes, 54; sweet potatoes, 76.3; hay, $11.71 ton; apples, 56 cents bushel.

Woman and the Home

From Day to Day

GRACE FOR THANKSGIVING.

For all Thy care and loving kindness, Lord,
Accept our thanks who gather round this board.
We see Thy goodness in each perfect thing:
The sky, the sea, the bird on happy wing,
And every blade that makes the velvet sward.
With hearts and lips in wonderful accord
Do we recount the blessings on us poured,
And lift our voices hymns of praise to sing,
For all Thy care.
Help us to help the needy and ignored;
Teach us mere riches no true peace afford,
And grant to each that he may often bring
Some consciousness of Thee to laboring,
And prove, O Guardian, a worthy ward,
For all Thy care.

—Criterion.

*

A MASSACHUSETTS man tells us that the best baked beans he has ever eaten are prepared by a New Hampshire woman, who uses maple sugar for flavoring, instead of the customary molasses.

*

SOME handsome embroideries for table scarfs, center pieces and cushion tops are worked in combinations of silk and wool; for example, tan or gray linen embroidered with clusters of flowers worked in pink silk, while the foliage is worked in green wool. The silk and yarn are both quite heavy, and the work is very effective. These scarfs and table covers are often bordered with heavy knotted fringe, instead of lace.

*

FRIENDS of THE R. N.-Y. who are unfamiliar with New York often call, during a visit in this city, to ask some question about places of interest or instruction which they wish to visit. Most crop producers are interested in markets and transportation, and they naturally wish to see how commodities are handled here. It is very easy for THE R. N.-Y. to tell them just where to go, and what to look for. Others there are, especially women visitors, who wish to see things of general interest; the great shops, churches, art galleries, museums, etc. We should be very glad to offer help in these lines too—to answer questions about special points of interest, or means of getting to them, whether the inquirer wishes to see Alaskan totem poles or new bonnets, Gobelin tapestries or a fashionable tea-room.

*

CRITICISMS of country schools are frequent, and often quite specific. There is one thing, however, that is noticed in the business correspondence of our subscription department especially and that is the great improvement in standards of writing and diction during the past decade. We mention subscription work especially because much of this correspondence comes from young people, who become interested in it as a means of acquiring a little extra pocket money. Clear legible handwriting, and an observance of business forms in diction, are the rule in such correspondence; and this general excellence becomes more marked year after year. We realize, however, that it is not schools alone that are responsible for this development, but also the wider outlook of rural people due to a variety of causes, including the agricultural press.

*

A REQUEST printed in the New York Sun for a cruller recipe brought the following answer from Bertha B. Stratton of New Jersey:

Break two very fresh eggs into quite a large bowl; one cup of sugar, then beat up the whole. Add three cups of flour, all sifted and light, then beat it again with all of your might; add one teaspoon of ground nutmeg and half teaspoon of salt, three tablespoons melted butter and then you must halt; not a bit more butter or they'll not be light, but soaked and soggy, a sorry sight; now add a coffee cup of milk quite sweet and all together vigorously beat. A secret there is to make them "great," and this is it, as sure as fate: Two teaspoons of baking powder at the last minute should with a fourth cup of flour be lightly stirred in it. On a well floured board roll out half an inch thick, and drop in boiling lard, which will fry them quick. (Cut out with a cutter any shape you desire—round, elliptical, cross legged or like sticks for the fire.) The lard must be fresh and heated just right; test the heat by a piece of bread browned nice and light; while you're counting sixty 'twill brown to a turn, but your crullers are safe, they will not burn. Put only three in at a time, turn them over; when they rise from the bottom and have fried a nice brown. Five dozen 'twill make if you use my direction, and you'll have a fried cake that is nearly perfection.

The Rural Patterns.

When ordering patterns, give number and size of pattern desired. Price of each pattern 10 cents.

The redingote or polonaise dress, 8460A, is shown in a combination of two materials, but one material only may be

used if desired. Pattern 8460A is cut in sizes for 16 and 18 years. For the 16-year size, the dress will require 4 yards of material 27, 36 or 44 inches wide, 3⅛ yards 50 for the polonaise, and 2 yards 44 inches wide for the lower portion of the skirt and the sleeves, 1¾ yards 36 for the upper portion of the skirt.

8313, Girl's dress. Cut in sizes 4, 6 and 8 years. Size 6 requires 1⅜ yards

of 27, 36 or 44 inch material for blouse and 1⅛ yards 27 or 36 inch for skirt and trimming; or 2¼ yards 27 or 36 inch for entire dress. 8343, Child's rompers. Cut in sizes 2, 4 and 6 years. Size 4 requires 2½ yards of 27 or 36 inch material. 8288, Blouse with yoke and sleeves in one. Cut in sizes 34 to 40 bust measure. Size 38 requires 2¼ yards of 36 inch material. 8281, Two-piece skirt. Cut in 22 to 30 waist measure. Size 26 requires 2¾ yards of 36 or 44 inch material for skirt, five-eighths yard 36 or 44 for insets. 7939, Boy's suit. Cut in sizes 2, 4 and 6 years. Size 4 requires 2½ yards of 36 inch material with 1 yard 27 for trimming. 8326, Child's dress. Cut in sizes 2, 4 and 6 years. Size 4 requires 1⅛ yards of 27 or 36 inch material for body portion and 1⅝ yards for skirt; or, 2⅜ yards 36 inch to make of one material.

Books for Girls.

ON page 997 we gave a list of 25 books for boys, endorsed by the New York Board of Education. A number of correspondents have expressed their interest in this list, and have asked for a similar list for girls. We asked the New York Public Library for this girls' list, and the books given below are recommended by this authority:

1. Little Women, by Louisa M. Alcott.
2. Jack and Jill, Alcott.
3. An Old-fashioned Girl, Alcott.
4. Jeanne d'Arc; the Maid of France, by M. R. Bangs.
5. The Secret of the Clan, by Alice Brown.
6. A Little Princess, by F. H. Burnett.
7. The Secret Garden, by F. H. Burnett.
8. Six to Sixteen, by Mrs. Ewing.
9. Nelly's Silver Mine, by Mrs. Helen Hunt Jackson.
10. A Texas Blue Bonnet, by C. E. Jacobs.
11. Lady Jane, by Mrs. C. V. D. Jamison.
12. Mrs. Leicester's School, by Charles and Mary Lamb.
13. The Slowcoach, by E. V. Lucas.
14. The Story of Babette, by R. M. Stuart.
15. Mother Carey's Chickens, by Kate Douglas Wiggin.
16. Rebecca of Sunnybrook Farm, by K. D. Wiggin.
17. The Old Curiosity Shop, by Charles Dickens.
18. The Pipes of Clovis, by G. D. Boylan.

The above are all story books; there are many books of travel, history, nature study and handicraft that are strongly recommended. But it was agreed, by the authorities appealed to, that girls ought to read boys' books too, because many books written especially for girls tend to accentuate the sentimental side to an undesirable degree. We were glad to see our old friend Miss Alcott given a place of honor by modern authority. Among the newer books in the above list, our own favorites are "The Slowcoach," by E. V. Lucas, and "The Secret Garden," by Mrs. Burnett.

To have a memory for benefits, not for offenses these are the two pivots on which friendship may rest strong and abiding, friendships which pass to the greatness of noble minds * * * Be not like those who are more hurt and offended by an unkind word or by a word meant in fun, and which escaped, as it were, from cloister, unlocked for a moment by the tongue—yea, more hurt than they ever were pleased, and comforted by a thousand renewed proofs of loving friendship.—Petrarch.

The American Parlor Lamp makes your home beautiful and comfortable. Lights the entire room with a soft white light, almost as light as day. Easy on the eyes—you can read or sew by the hour and not have the least tinkling of tired eyes or headache.

The American gives a light of 400 candle power and does it for one-third of a cent an hour. Always pleasant to use—no wicks to trim or chimneys to wash—nor is there any smoke or disagreeable odors. Nickel-plated finish, plain white or fancy shades with fringe to match.

NO. P 67

Put an American in your Home for Christmas. Makes a beautiful Christmas Gift.

Ask your dealer about the American P67 Lamp or write for large circular.

American Gas Machine Co.
511 Clark St., Albert Lea, Minn.

For Hunters—Trappers—Farmers—Automobilists, Etc.

THE BALDWIN CARBIDE LAMP
Generates and Burns Acetylene Gas

Makes night hunting and fishing greater sport than ever.
Throws a wide circle of light 150 feet on the darkest night. More powerful than electric light. Makes night driving, hunting or boating safe. Can be carried as a hand lantern or worn on the cap or belt, leaving both hands free. Fine for working about machinery, repairing punctures at night, hunting stray cattle, etc.

TRY THIS LAMP FOR TEN DAYS
Order a Baldwin from us or your dealer. Use it for ten days. If not entirely satisfied, return the lamp and we will refund your money. Your dealer is authorized to make the same arrangement with you.

FREE TO YOU
Send us your dealer's name and we will mail you our very instructive booklet, "Knots and How to Tie Them." You should have this. The illustrations show you how to tie many kinds of knots.

MOVIES AT HOME WINTER EVENINGS. THE WONDER MOTION PICTURE MACHINE. COMBINED FILM PROJECTOR AND STEREOPTICAN. TWO MACHINES IN ONE AT THE PRICE OF ONE. BOX OF FILM FREE WITH EACH MACHINE. $10.00

The WONDER MACHINE is a masterpiece of simplicity. It projects a clear, bright and steady picture. Is always ready for use—can be operated by a child. It projects motion pictures from standard motion picture films, the same as those used in motion picture theaters. Young and old grasp the lesson taught in Motion Pictures. The evenings of the family are made delightfully entertaining and instructive—the home becomes the center of social enjoyment. The Wonder Machine also uses magic lantern slides. It is a stereoptican. It is operated by its own battery or can be connected with electric home current. All machines are guaranteed. These machines make a valuable Christmas gift for the young people. Price, $10. Shipped promptly on order. 50% deposit on all orders, to guarantee shipment.

AGENTS WANTED. APPLY FOR TERRITORY.

THE WONDER MOTION PICTURE CO., 1133 Broadway, New York City

Seen in New York Shops.

NEW blouses introduced as American tailored models are of sheer voile, pleated, with stiff laundered collars. The collars are of the large flaring type, standing up at the back, while the blouse is pleated in fine tucks into a yoke. Another style is of novelty crape, with a high turn-over stock and turn-back cuffs of pique. These blouses are offered at $2 each.

Hats of fine felt with soft crowns have the brim faced with velvet. Among the colors are sand, Dutch blue, fur brown, jasper green and pearl gray; the velvet facing is always black. Fantaisies of monkey fur are fancy hat trimmings of this fur combined with flowers, ostrich feathers or metallic galon; some are really pretty, others grotesque.

Little fur collarettes are among prevailing styles; they fit the neck snug, and may be of fur alone, or of silk or velvet, trimmed with fur. One style seen was a band of moire taffeta about three inches wide with a strip of fitch fur down the center; it was finished at the back with six large outstanding loops of the silk, while a rose was set a little at one side of the front. Most of these collarettes have a flower or a tiny bouquet put at the left side of the throat. A band of maline, with a big fluffy bow at the back is often worn close around the neck with a low collar or décolleté waist. There is always a flower a little towards the left side, on the maline band, and this is a becoming fashion for one with a long neck.

Among the cheaper furs used for coats is hamster, a rather short coarse fur that is dyed in imitation of better skins, though reliable furriers do not seek to deceive the buyer by calling it anything that it is not. The true hamster is a rat-like animal found in Eastern Europe and Asia; it has much the same habits as our native pocket gopher, carrying its food in its cheeks, and storing it in burrows, but the name hamster is given to other nearly allied rodents. A woman's coat of hamster fur costs from about $35 up, and is quite warm and serviceable, though naturally it does not compare with handsomer furs. At present the most fashionable of all furs is blue fox, which has suddenly come into extra popularity again. One of the very good shops recently held a special sale of natural blue fox sets, muffs and neck-pieces, for $175 a set, which was said to be one-third less than the usual price, while dyed blue fox was offered at a special price of $85 a set. Of course dyed blue fox may be bought cheaper than this, while the natural may cost much more than quoted. The finest and silkiest fox furs are quite perishable if given hard or regular wear.

Navy blue, one of the most useful colors in woolen dress goods, is now very much in style for all sorts and conditions of women, also all the other dark shades of blue, known as marine, midnight and men's wear shades. The fabrics are storm and French serge, gabardine, poplin and cheviot, ranging all the way from 50 cents to $3 a yard. Such materials and colors are highly desirable for a one-piece dress, black being usually combined with the blue as trimming or as part of the dress. Bindings of black silk braid are very often used on such dresses.

Attractive jacket suits of wide-wale corduroy have Norfolk coats with a little fur collar, and a wide gored skirt. Many suits are fur-trimmed, some with cuffs and small close collar, or a little square collar standing up at the back, others with a band on the skirt also. The fur band is very rarely put at the foot of the skirt, but is usually from four to eight inches above it. Fitch and skunk-opossum are the leading furs for trimming suits.

Blanket bath robes for every member of the family are now procurable in numerous combinations of soft colors, pink, fawn, blue, lavender and gray, as well as the standard patterns of red, blue and dark gray. Bound with satin ribbon and with or without satin collars, they begin at about $2.50 in girls' sizes, very nice ones in adults sizes costing from about $4.75 up. They add much to Winter comfort, especially where a house is not very well heated.

Colored collar and cuff sets are offered for wear with plain waists of sheer cotton or silk. Many of these have the Elizabethan collar which, while rolling open in a V in front, is laid in up-standing pleats at the back. One pretty set noted was of blue and white striped organdie, edged with a narrow band of white embroidered in white dots. There were deep cuffs to match. Another set was of flesh-colored satin, in the same style. Flesh color is extremely popular in blouses, neck dressings and other accessories.

Steamed Chocolate Pudding; Roast Pig.

WILL you give a recipe for steamed chocolate pudding, also full directions for roasting a pig of about 20 pounds; time required for roasting, etc.
MRS. E. E. W.

Steamed Chocolate Pudding.—Boil one quart of fresh milk and pour over one pint grated bread crumbs, mixed with one-fourth cake grated chocolate, one cup sugar, one cup flour, one cup butter, two teaspoonfuls baking powder sifted into flour, one cup raisins, one cup chopped nuts. Put in a mold, steam two hours, and serve with sauce.

Roast Pig.—A pig weighing 20 pounds is rather large for roasting; the usual weight in the New York market is about 12 to 14 pounds, while Marion Harland recommends one weighing only about seven pounds. However, the usual sucking pig is from four to five weeks old. The 12 to 14-pound pig requires three to three and a half hours in a good oven; the 20-pound pig proportionately longer. Great care would be needed to prevent scorching, and as the cooking progressed it would be necessary to cover it with stiff paper, well buttered, if a covered roaster is not used.

We suppose the pig is already prepared, well cleaned and with the hoofs removed. Put it in cold water for 15 minutes, then wipe dry, inside and out. Make a bread stuffing as for turkey, seasoning highly with onion, sage, salt and pepper, moistening with melted butter and one or two eggs. Or else use hot mashed potato, seasoned as above. Stuff, sew up the opening, then bend the fore legs backward under the pig, and the hind legs forward, and skewer into shape. Put a cob into the mouth to hold it open. Put into a roasting pan, rub with butter, dredge well with flour, and put a little water in the pan. A covered roaster is preferable for cooking the pig, keeping it covered for the first hour and a half; then baste well with the drippings, and cover, leaving slide in cover open. After half an hour the pig may be basted again, and the cover of roaster removed, so as to brown it well. If an open pan is used the oven should be moderate at first, so that the meal is well heated through before it begins to brown, but thorough cooking is needed, and at the usual reckoning of 15 minutes to the pound this would mean five hours for the 20-pound pig.

When dished, arrange the pig in a bed of parsley and celery. Old custom was to put a red apple in the mouth and a wreath of parsley around the neck. In carving, the head is first cut off, then the hams and shoulders, after which it is split down the back and the ribs separated.

Irish Moss Blanc-Mange.

GET five cents worth of Irish moss from the drugstore, wash about one-fourth of this amount in several waters, then place in one quart of milk in double cooker. When moss is thoroughly cooked strain through colander, flavor and set aside till very cold. Serve with sugar and cream. The above is delicious and very nutritious. Do not rub the moss through colander, or blanc-mange would be dark; should be perfectly white. I have used this many years in our family, but have never found it in any of the papers or cook books, so perhaps it will be something new, and hope you and your readers will enjoy it as much as does the writer and family. C. L. L.

R. N.-Y.—This delicate blanc mange is much used in Great Britain, and is often advised for invalids or ailing children, as it is readily digested, and nourishing. Sea moss lemonade, made by boiling this Irish moss in water, straining the moss out, and then seasoning with lemon and sugar, is a soothing drink to one suffering from feverish cold and cough. It is usually an acceptable beverage to a child with measles. A jelly is also made by cooking the moss in water, instead of milk, straining, and then flavoring with lemon and sugar.

Philadelphia Scrapple.

WILL you give a recipe for Philadelphia scrapple? MRS. C. B.

The following recipe for Philadelphia scrapple, given in the Rural Cook Book, was contributed by a Pennsylvania reader: Take a cleaned pig's head and boil until the flesh strips easily from the bones. Remove all the bones and chop fine. Set the liquor in which the meat was boiled aside until cold, take the cake of fat from the surface and return the liquor to the fire. When it boils, put in the chopped meat and season well with pepper and salt. Let it boil again and thicken with cornmeal as you would in making ordinary cornmeal mush, by letting it slip slowly through the fingers to prevent lumps. Cook an hour, stirring constantly at first, afterward putting back on the range in a position to boil gently. When done, pour into a long, square pan, not too deep, and mold. In cold weather this can be kept several weeks. Slice and fry brown in butter or dripping.

Canned Vegetable Soup.

WILL you give us a recipe for the making and canning of a soup exclusively of vegetables? I refer to mixed vegetables, chiefly potato, cabbage tomato, celery, etc. MRS. N. J.

Vegetable soups are quite plentiful, though many of them have a meat or milk base. But we have never canned any, and would be glad to hear from anyone who has had this experience. What is commonly called vegetable soup has a meat stock base, but pea, bean, lentil or tomato soup may be made without meat stock. There are also many cream soups made of vegetables, as celery, salsify, spinach, etc., but these consist largely of milk. Whether they would keep, under domestic canning conditions, is a thing that could only be decided by experience. We should like to hear from housekeepers with this practical knowledge.

Four Big Advantages to You on all your Buying

1 No Delivery Charges. The Charles William Stores is the only big mail order company that pays delivery charges on practically everything. You have *no* delivery charges to pay on *anything* shown in the first 454 pages of "*Your* Bargain Book." You have *no* delivery charges to pay, or we *help* you pay on practically *all other* merchandise shown in our big 1186 page catalog, nearly every where in the U. S.

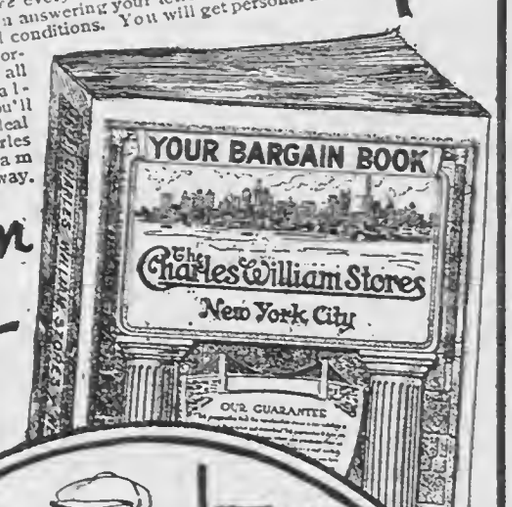
2 Quicker Delivery. We maintain an absolute 24-hour time table on all orders. 85% of all orders are shipped the day they are received. 12% are held not longer than 24 hours and only 3% are delayed. No concern can be perfect, but we are aiming for perfection to eliminate the 3% delay. Located as we are, in New York, shipments reach our customers much quicker than from other sources.

3 New York Merchandise. The newest Fifth Avenue styles, the clothes that the well-dressed women of America's Fashion Center wear—are now produced for *you* —at prices *you* can afford. And all other merchandise in our book is new and fresh —bought in New York, the world's greatest commercial center, where 60 per cent. of everything you wear and use originally comes from no matter *where* you buy it.

4 Courtesy. Every customer gets the kind of *service* everybody *wants*. There is no curtness in answering your letters, no set "forms" to meet all conditions. You will get personal attention on all orders and letters, always. You'll *like* to deal the Charles William Store's way.

"Your Bargain Book" Free

Wherever you are now buying your daily needs, and whatever prices you are paying, you will find it prontable to compare with the offers made in "Your Bargain Book". Thousands of other alert, progressive men and women are delighted with the advantages described above, and the substantial money savings obtained when dealing in New York through "*Your* Bargain Book." Write today for your copy—it is free.



Popular Shaker knit sweater of heavy quality cotton and wool mixture. Storm collar of double thickness rolls up tight around the neck. Two large pockets. Sizes, 26 to 32 chest. State size. No. 33E1234 Gray. Prepaid price, each **$1.29**
Many other styles illustrated and described in "Your Bargain Book," pp. 238-239.

The Ascot Glove

Made of imported capeskin, in excellent quality, with 3 rows of stitching. The best $1.00 cape glove ever made, sizes 5½ to 8, in quarter sizes. State size.
No. 22E390 black.
No. 22E392 tan.
Many other gloves for every occasion are illustrated and described in "Your Bargain Book," pages 156 to 169.

No. 11E9000. Good luck birthstones, set in good weight, solid gold mountings. Be sure to state what month stone you wish. Prepaid price, each . . **$1.35**

Live Stock and Dairy

AN ADDITIONAL SHORTHORN RECORD.

NOW that milking Shorthorns are being imported into this country, it is greatly important that the best in every way shall be got out of them as far as this may be possible. As registration stands now in the existing Shorthorn record, the importers of the milking Shorthorn meet with a very serious handicap. It is probably correct to say that more than half the dairy Shorthorns, as they are called in England, are of short pedigrees, so short, that they do not fulfil the requirement of the American record. They find a place in the English Herd Record, as five generations of breeding from purebred Shorthorn sires will admit them to registry in that book.

Now it is a fact that many of the best of those registered Shorthorns have short pedigrees. Many of the very best performances at the pail are of that class. For some of them the highest prices must be paid, or the importer cannot secure them.

Suppose that he purchases these in his search for the very best producers, and that he brings them to America. When they reach our shores they are grades. In England they are purebreds; in America they are grades. That does sound absurd. Cattle are imported because of their superior intrinsic value, and a voyage across the Atlantic will divide that value by two, and in some instances by three, or four. Can anyone imagine a greater handicap than this on the breeding of dual Shorthorns in America? The answer is not valid which would say that they may be bred from existing Shorthorns that are now registered. Of course they can, but the country cannot wait for this. The country is crying out for milking Shorthorn sires, and it cannot get them in anything like a sufficient supply. Shorthorn sires are being sold that in many instances are represented as milking sires when they are not. Neither on the side of the dam or the sire have their ancestors been milked, hence they have no just claim to be classed as milking Shorthorns. So great is the demand for pedigreed Shorthorn bulls in America today of the dual class that it would seem correct to say, if 10,000 such bulls correctly bred were available in America they would not remain unsold for 10 days.

This does not mean that there are no milking Shorthorns in America bred on correct lines. There are some herds, but they are few. They are so few that the sires from these, so to speak do not make a drop in the bucket. Nor does it mean that among herds of pure Shorthorns which suckle their calves, there is not a goodly number that milk with relative freeness, but no adequate measure has been taken of their performance at the pail. They have been allowed to go dry after every calving at the end of seven or eight months, hence in the true sense of the term they are not milking Shorthorns. Nor does it mean that Shorthorns are not superior to the cows of most other breeds in furnishing beef for their calves.

In the absence of another record, or in the absence of some modification in the present record, the breeding of milking Shorthorns in this country will be greatly handicapped. The handicap on importations has already been referred to. But the handicap is more far-reaching. There are in this country very many cows essentially good performers at the pail, but they are not registered and never can be under the existing rules that govern the registration of Shorthorns in this country.

There is no great incentive on the part of the owners to improve them. No matter how many crosses of pure Shorthorn blood they can show they are still grades. It makes no difference how high they may attain in individual excellence or in performance, they are still grades. Now if record were allowed for these, in time very many animals would be able to furnish a pedigree that would entitle them to registration. It is only the necessity for registration that is being discussed. It is too soon to discuss in all details the rules that should govern such registration, but the question may be at least raised at this time, as to whether such an organization should be under the wing of the American Shorthorn Association, or independent of it and separate from it.

In England as is generally known, the registration of milking Shorthorns is in the same record as the registration of Shorthorns of any class. There is a record kept, however, of the performance of the dairy Shorthorn cows as far as the owners may care to have their records published. There would be no great obstacle in the way of having the registration of these cattle conducted by the American Shorthorn Association provided it is in a separate record, and with rules governing the same modified as outlined above. True, some provision has been made for taking care of milk records. An association has been formed to advance the interests of dairy Shorthorns. The reference is to the "Dairy Shorthorn Cattle Club." But the provision thus made as seen by the writer is inadequate. Much more could be said in favor of this proposition.

THOMAS SHAW.

THE WAR AND PUREBRED STOCK.

Aberdeen Angus Cattle; Belgian Horses.

I DO not think the war will affect Aberdeen Angus cattle breeding in this country at all for two reasons. We have almost ceased the importation of that breed of cattle, because we now believe we are doing fully as good work as they are, if not better, and because the war has not, as yet, interfered with the business in Great Britain. I have just returned from France, Belgium and England, where I had spent most of the Summer in an attempt to import horses, and have observed the conditions very closely. I left a fine lot in Belgium and France, not being able to get them out of the country, and now, I presume, they may be nearly all destroyed. From Belgium it is more than probable that there will be no more horses taken for this country in a considerable number of years to come, but we have a very good start in foundation stock, and should go right along breeding good horses, so as to be ready to furnish them with material to build upon when the war is over.

In France the war has not encroached upon the horse-breeding districts, but it is fair to presume that many of the best have been commandeered for war purposes, and we may expect an embargo on exportation from that country after the war, for a sufficiently long time to recoup. Thus we are likely to be given a chance to demonstrate what we can do with material at hand, without exterior aid, and I am satisfied, for it is now time for us to try walking alone in the business, if we are ever to do so. H. M. BROWN.

Highland Co., Ohio.

Future of Jersey Cattle.

The European War has prevented the shipment of Jersey cattle from England and from the Isle of Jersey to this country, orders from the British Government prohibiting for the present the exportation of live stock having any food value.

"NO MORE HOG CHOLERA FOR ME I EAT COOKED FOOD"

Just Hog Talk—however hogs don't want cholera, worms or disease—but the health that comes from good, clean, wholesome food. YOU SHOULD GET

THE WHOLE STORY

Every farmer who raises hogs—you—absolutely needs to know the whole story—needs our free booklet "The Undigested Toxines—The Science of Feeding."

It tells the whole truth about raw and cooked foods—how to prevent hog cholera, worms and other diseases in animals—how to keep **hogs, cows, sheep** and **poultry** healthy—new thoughts—old methods—

Puts Dollars in Your Pockets

THE RURAL NEW-YORKER,
333 WEST 30th ST., NEW YORK.

This action will prevent the importation of several hundred head of Jersey cattle this year. How long the embargo will continue, of course, it is impossible for me to say. The Jersey breed in America is now so widely disseminated, and its numbers are so large, that I do not anticipate that this temporary stoppage of importation from the island will have any very serious effect upon the breed in this country. I think that in future some countries, especially Australia and New Zealand, will look to this country for their Jersey stock, not only on account of the United States being more accessible, but because the Jersey breed has been developed to a higher productive standard here than on its native island.

American Jersey Cattle Club.

The Brown Swiss.

IN regard to what effect the European War is likely to have upon the Brown Swiss cattle, I do not see any reason for it affecting our cattle in any way at the present time as we have not been able to import any cattle during the last five or six years. The thing that seems more likely to trouble us is trouble at home, with the foot and mouth disease.

IRA INMAN.

Brown Swiss Cattle Breeders Association.

Outlook for Guernseys.

AS to whether or not the European War is likely to interfere with the Guernseys I am somewhat at a loss to make any statement. It has of course materially lessened the number that will be imported. I sincerely hope that nothing will happen that will affect the Island of Guernsey. Aside from that we have in this country now a very fine representation of the best of the Island, and English strains. I judge that from the standpoint of breeding we would not be materially affected. I think that we have enough to perpetuate the best strains in this country. The war will have nothing of the effect that this unfortunate widespread, area of infection from foot-and-mouth disease will. At the present time all movement of cattle from the Atlantic to Iowa is restricted. The magnificent and valuable cattle which were exhibited at the National Dairy Show, which included the very best of all the breeds, some animals which it had taken years of careful and intelligent breeding to produce, are now under quarantine. It is to be hoped that nothing will happen to them, as their loss would mean an irreparable one to the future of the improved dairy stock husbandry.

WM. H. CALDWELL,

American Guernsey Cattle Club.

Care of One Cow.

WE expect to start keeping a cow, for the first time, about November 1; we have a suitable place for housing her, but our land is somewhat limited. How closely confined to the stable could we expect to keep her? I expect she will freshen about April 1, or possibly a little earlier. We have about 100 square rods of land, beside a small vegetable garden, about evenly divided, one half grass land, rather poor seeding, balance been used for garden. The 100-rod lot is rented for one year, from November 1. I am plowing up the plot used for garden and sowing Winter rye (Oct. 8) to be plowed under. What can we plant on the 50 rods in the Spring that will give the largest returns, in connection with the pasturing of the other 50 rods. We desire, if possible, to support the cow on the 100-rod lot together with such stuff as we may have from the vegetable garden of about 30 rods. Would it be policy to pasture the rye this Winter? What do you know of the Red Polled cows? She is a natural mulley, rather large and dark red.

Plymouth, Mass. W. L. H.

We should give this cow a roomy box stall, say 10 or 12 feet square, and not tie her. Keep her well bedded and give plenty of fresh air. On warm, bright days of Winter let her out in that pasture. We would not pasture the rye this Winter, but let the cow have it in Spring. We should divide the 50 rods into three parts. On one part seed oats and Canada peas early in the Spring. On another third sow fodder corn thickly in the drill—on the other third mangels or carrots. As the oats and peas are fed off sow more fodder corn, and as the corn is cut seed barley and rye, half and half. The Red Polls are good cattle—a combination of beef and dairy. For a family cow we find equal parts cornmeal and wheat bran with a handful of oil meal at a feed very satisfactory.

Purdue Calf Meal.

WE have all heard of the Cornell laying-house, and the latest is the Purdue "calf meal." Indiana must have more cows, and raise more calves. The Hoosier people sell enormous quantities of whole milk, and it has been considered expensive to raise heifer calves. Mr. Lawrence, of the Extension Department, says: "We developed the meal for the dairyman selling milk to the condensery, or retailing his product. If he has skim-milk we advise him to feed it, if he can get 35 or 40 cents for his skim-milk, we advise the calf meal." One pound each hominy, red dog flour, linseed meal and blood meal; if red dog flour is not accessible use wheat middlings. The oil meal should be old process. This meal takes the place of skim-milk. Do not make the change to skim-milk suddenly, feed whole milk until the calf is a week old. The change from milk to the substitute must be gradual. It should be spread over a period of five or six weeks, starting with but an ounce, for the day, diluting with seven times this weight in water. The feed may be increased to three ounces for several days, and then to five ounces until at the end of 30 days the calf is receiving two pounds of calf meal, and the milk is entirely eliminated. It is figured that in mixing seven pounds of water to one of the meal this is equal to the same quantity of skim-milk. With the calf meal is fed ground corn and oats as soon as the calf will eat the mixture dry. Corn silage and Alfalfa or clover hay should be supplied the calves.

Possibilities in Pork.

"THERE never was such a chance afforded our bright men as today in the raising of hogs. They can make more money raising hogs than in any other line of farming. Of course, this means that the young men must give to the raising of hogs the same careful attention as in any other line of business."

This advice is credited to E. T. Cash and it is sensible. In most Eastern States near towns or villages there is fair profit to be made at selling little pigs for others to raise. In many cases there is more in this business than in trying to raise pork.

"Pixey" Cattle.

WILL you ask your readers if there is a breed of cattle known as "Pixey?" I have just bought a young cow and was told she was half-bred Jersey and Pixey. What, if any, are the markings? A. H. A.

New York.

We ask the question herewith. Never heard of the "Pixeys" ourselves. It is probably a local name for some family of native or grade cattle. If there is anything to it some of our readers will know.

Prevent Cattle Disease

Office, 50 Clinton Ave.

Purebred Registered
HOLSTEIN CATTLE

Superintendent Smith of the Geneva Experiment Station says the average production of butter-fat per cow in New York State is about 100 pounds per year. The State College in Ithaca has a cow descended from common stock on one side and from a line of purebred Holstein sires on the other. This cow has produced 479 pounds of fat in a year.

This is interesting as proof that intelligent improvement of grade herds can multiply the butter yield by four and five.

The Henyard.

THE EGG-LAYING CONTEST.

THE second week of the egg-laying contest at Storrs shows a production for the week of nearly a thousand eggs—912 is the count. This is more than double the number laid in the second week last year, but there are 18 more pens in this year's contest. In the first two weeks last year there were 890 eggs laid—in the same period this year 1,663 were laid. Allowing for the larger number of birds, it still looks as if we were making decided progress toward an average increase in egg production by American poultry. Everything that contributes toward this end is certainly worthy of enthusiastic support. It is worthy of note that out of 40 pens of White Leghorns all are laying but three pens. The notion that Leghorns were not good Winter layers, has been pretty thoroughly exploded by the performance of this breed at the different contests. The Yankees are "catching on" as to how this thing is done. Last week the pen of White Leghorns from Windsweep Farm took first place with a score of 47; this week they again take first place with an increased score, viz., 49. That is 10 eggs ahead of the Englishman, Ed Cam, whose White Wyandottes take second place with a score of 39. White Leghorns from Storrs Experimental pen are third with a score of 35. Mr. Cam's birds are making a better start than Mr. Barron's, both the Wyandottes and Leghorns but it's the best at the finish that counts. The week's record follows:

GEO. A. COSGROVE.

Chicken Pox.

A FAMILIAR disease to those living in the warm climate of the Southern States, but comparatively rare in the North, chicken pox is of interest to poultrymen, who should be able to recognize it when it appears in the flock. It is a readily communicable disease, rapidly spreading in a flock when conditions are favorable. It is caused by the presence of a fungus which gains entrance through the skin of the affected fowl and produces an eruption resembling rough, yellowish warts about the beak, nostrils, eyes and other portions of the head, and in severe cases, extending even to the feathered portions of the body. These wart-like bodies attain full development in from five to 10 days, and typical ones show a central depression similar to that shown in the eruption of smallpox in humans. There may be a discharge of yellowish matter which dries up to form a scab and, later, falls off. When the disease is mild, the health of the bird does not seem to suffer but in more severe cases the plumage becomes rough, flesh and strength are lost and the fowl may die from exhaustion. In pigeons the disease is more severe, the eruptions may extend to the interior of the nostrils and mouth and early death may follow.

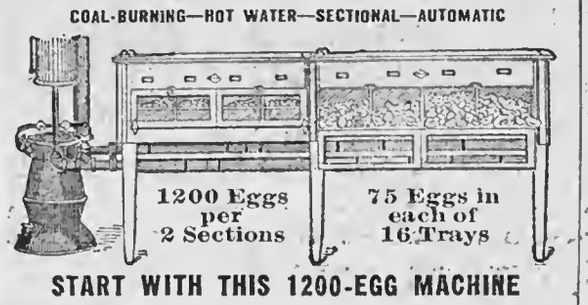
Like all contagious diseases, chicken pox should be prevented by isolation of suspicious cases and thorough cleansing and disinfection of utensils and quarters. The spread of the disease is favored by dampness and the accumulation of droppings and filth about the perches. Fowls with diminished resistance because of lowered vitality are more prone to succumb to possible infection than those of abundant vigor. Local treatment consists of anointing the eruption with disinfectant preparations; carbolized vaseline and sulphur ointment being usually recommended. Painting the eruption with tincture of iodine is said by a Southern correspondent to be very efficacious and superior to ointments. M. B. D.

Disinfecting Henhouses and Kennels.

PLEASE tell me of a good and cheap disinfectant to use in keeping dog kennels and chicken houses free of vermin. How often should chicken houses be whitewashed? You cannot whitewash inside of kennels. W. S. R.
Connecticut.

Poultry houses should be whitewashed in the Spring and Fall using four ounces of crude carbolic acid to the gallon of lime wash if it is desired to increase its effectiveness as a vermin destroyer. The limewash alone is a good disinfectant, however. It should be freshly made of unslaked lime. The inside of a kennel may be painted with a solution of crude carbolic acid and kerosene using the former in the proportion of one-fourth of the bulk. It will be necessary to air it thoroughly after using this before confining animals to it and it will retain a wholesomely sanitary odor for some time. M. B. D.

CANDEE INCUBATOR
COAL-BURNING—HOT WATER—SECTIONAL—AUTOMATIC



START WITH THIS 1200-EGG MACHINE

TURN 2-cent eggs into 15-cent baby chicks. Every community needs a custom hatchery. There are hundreds of these coal-burning, hot water sectional Candees operating in all parts of this country and Canada. One operator who sold 24,000 chicks last season refused orders for 22,000 more. **Many have paid for their machines and made money the first season by simply hatching eggs for others.**

Double Regulation—Double Safety

Besides the regulator on the coal-burning heater, there is a thermostat regulator in each 300-egg compartment. You can start each compartment separately for different customers, and keep just the right temperature required by different settings, days apart. Wire partitions between trays of 75 eggs each prevent mixing customers' eggs.

No other machine like it. Comes in sections all ready built for you to set up and add extra sections any time. **Costs a few cents a day for coal and takes a few minutes each day to operate. No danger from fire.**

Write today for our 140-page catalog describing the machine and telling you how to start a custom hatchery business. We furnish cellar plans free.

CANDEE INCUBATOR & BROODER CO., Dept. 27., EASTWOOD, N. Y.

MAKE HENS LAY
By feeding raw bone. Its egg-producing value is four times that of grain. Eggs more fertile, chicks more vigorous, broilers earlier, fowls heavier, profits larger.

Foot and Mouth Disease Teaches Great Lesson

QUICK! NOW DISINFECT Your Stock, Your Barn, Your Yards; Everything On Your Farm! Special Offer—500 Gallons Unequalled Disinfectant $3.00

Delivered Free! Money-back Guarantee!

Foot and Mouth Disease located in more than a dozen states and at the present writing is rapidly spreading. Most rigid quarantine established in Michigan, Indiana, New York, Maryland, Massachusetts, Illinois, Wisconsin, Pennsylvania, Ohio and other states. No animals (except horses) may be shipped out of these states. Chicago stock yards, the largest in the world, temporarily closed down. Spread of disease among valuable herds at National Dairy Show. The great International Live Stock Exposition now called off. Live stock markets upset. Thousands of head of cattle slaughtered and their carcasses buried in quicklime, 5 feet underground. This, in brief, is the situation of the most serious and the most sensational epidemic ever known in this country.

No one can say when this terrible epidemic will end. We sincerely hope and trust that our able government officials will stamp out this terrible disease at the earliest possible moment. But *you must help*. You must do *your* part—do it for *your own profit's sake* and for the sake of farming in general. How? By thoroughly disinfecting your stock, your farm, your yards, your poultry—*everything* on your farm. Foot and Mouth Disease is caused by a germ. When germs are killed quickly diseases are prevented. The

Best way to "Cure" Disease is to Prevent it

Even if your stock is hundreds of miles away from contagious diseases it will pay you mighty well to thoroughly disinfect every part of your farm so *you won't be taking chances*. A good strong safe disinfectant is the cheapest insurance and protection you can buy. It certainly proves the old adage, "An ounce of prevention is worth a pound of cure." It buries big profits *in your pockets* instead of burying your stock in quicklime. Yes Sir! *Now*, more than ever before—*now*, while your cattle are in the barn and not outdoors, *now*, while disease is everywhere, *now*, *while your stock is still free from disease* is the time to use a good disinfectant! And of all, none compare with

Cabot's MILKOL — **Its germ destroying and disinfecting power is nearly *twice* as great as the standard set by the U. S. Government.**

Manufactured by folks who've been making disinfectants for 30 years. It kills germs—the cause of practically all live stock diseases. It is 4½ times as strong as carbolic acid and chloride of lime, and unlike them is absolutely safe to use. It is efficient, inexpensive, convenient and *safe*. It is endorsed by the highest scientific authorities. It acts as a disinfectant, a germicide and an antiseptic. It's so strong and powerful that germs cannot exist wherever it is used. And it not only prevents disease, but is a reliable remedy for many of the common stock ailments, such as ringworm, sores, wounds, scratches, mange, footrot, worms, thrush, sprains, distemper, pink eye, glanders, all skin diseases, excellent in the treatment of cholera, and an unequalled dip for hogs, sheep and cattle.

PUBLISHER'S DESK

JAMES POWERS, of the Tax Adjustment Bureau, 69 Wall street, New York City, was convicted in the United States District Court last week on three counts of an indictment, charging the use of the mails with intent to defraud. He was sentenced to two years' imprisonment in the United States penitentiary at Atlanta on each of the two counts.—City Paper.

During the past year we had many inquiries about the Tax Adjustment Bureau, particularly from investors in lots on Long Island. Powers offered to register the lots for $1.50, with a view to investigation taxes. In some cases he offered an investigation and payment of taxes for $3. Our investigation indicates that he was performing no service whatever, and reports to this effect have been published in this department at various times. The business was even continued during his indictment, and right up to the day of his conviction.

On July 10 I sent Harris W. Jennings, Springdale, Conn., six queen bees, valued at $5, and can get no reply at all.
Connecticut. W. K. R.

We could not get any response from Mr. Jennings either in explanation of the failure to pay for these bees, or why it was not due as stated. The only conclusion is that our people will do better to reject any orders he may send them.

I have much pleasure in advising you that the check for the heifer killed by the Great Northern Railway March 16, has been received, thanks to your persistent efforts. I realize I would have been obliged to put it in the hands of an attorney to get my claim, if it had not been for you. You have made a life member for your paper, as I can endorse THE RURAL NEW-YORKER in the stand it takes for the public benefit. I thank you sincerely, and if there is any bill due, send it along and I will remit. I shall do what I can to extend THE RURAL NEW-YORKER. H. H. H.
Washington.

There is no bill. We have always believed that a wrong to one farmer is an injury to all farmers; and it follows that their protest against a wrong to one is properly expressed through their farm paper. Every man's membership in THE R. N.-Y. family entitles him to the influence of all in a just complaint.

I beg to acknowledge receipt of check in payment of damage claim for eggs which I gave you against the Adams Express Company. I guess the people don't want you to expose them. I gave one dollar for subscription, and will say that your services rendered me have saved me ten times the subscription price; in other words the paper at $10 per year to a business man would be cheap. It surely should be in very house, for almost all houses have some difficulties, and if THE RURAL NEW-YORKER can't eliminate trouble, then I don't know who can.
New Jersey. S. J.

This is a sample of enthusiasm. Unfortunately THE R. N.-Y. cannot eliminate all trouble. Through the influence of its readers it can do a little at times. It does this by being entirely fair to all parties. It never asks of another what it would not grant if it were in the other fellow's place. In that way it inspires confidence, and then sometimes difficulties disappear. The recognition of this spirit of fairness and the evidence of that confidence, is one of the joys of life.

Your article on the Phelps building certificates ought to save your readers a lot of money. Hereabouts we all laugh at the "Great I AM." F. S. C.
Massachusetts.

Coming from a neighbor this is significant. You can't fake all of the people all of the time.

The oxypathor has at last been adjudged a fraud by a court of law. The Federal court at Rutland, Vermont, found the manager of the Oxypathor Company of Buffalo, N. Y., guilty of using the mails to defraud, and he received a sentence of 18 months in the Federal prison at Atlanta, Ga. This scheme seemed to have been operated by several companies which controlled certain territory. Besides the one in Buffalo there was one in New York City, which was driven out of business some time back by the Vigilance Committee of the Advertising Men's League. There was also one in Chicago, and another operated at one time from some point in Pennsylvania.

The oxypathor is a small box filled with sawdust and some other inert matter. It is provided with a cord at each end; and the patient was to attach one string to his head and the other to his feet; the claims were that this would cause an extra amount of oxygen to be forced into the blood, and that a cure would follow. Doctors and chemists who examined the box and analyzed its contents invariably asserted that the matter was inert, and could have no physical effect whatever on the patient. The cost of the instrument was $35. They were sometimes sold under guarantee; but we were never able to get the cash returned. We exposed it several times in the past, but the advertisements appeared quite regularly in papers of high and low degree.

I was recently a prospective victim of the agricultural paper fake. The agent produced a 14-karat, self-filling fountain pen, which I was to have absolutely free, also three farm papers. These I could have by paying the postage provided I would speak a good word for them with my neighbors. I told him at once that I had no time or inclination for canvassing and furthermore that I had all the farm papers I had time to read, including THE R. N.-Y. The agent at once said that THE R. N.-Y. was a good paper, but that his was equally good. He did not press the matter further, and drove away. I am wondering if my mention of your paper was the reason for his desisting so suddenly in his "philanthropic" efforts? A. B. R.
Connecticut.

Papers which do not have a legitimate subscription list are not entitled to second-class postage rates. The law is that any publisher may mail all the papers he pleases provided he attaches a postage stamp, but only papers that have genuine subscribers paid for may be mailed at second-class rates. Papers that are not able to secure a genuine list of paid subscribers sometimes resort to the "free-pen" device to secure a list and second-class mail privileges; but this does not satisfy the law, and if the postal authorities had the record, the papers would not be delivered at pound rates. At best it is a scheme to beat the Federal government on its postal rates. On their own representation these publishers must get all the cost of publication and profits out of the advertisers. It follows that their sole obligation is to the advertisers, and not to the reader. If there is any dispute between the subscriber and the reader the publisher has no choice but to take the side of the advertiser. Such sheets are advertising circulars and should pay the postage rate for that class of matter.

I am almost overwhelmed with inquiries from people throughout the United States as a result of the publicity we have gotten in THE RURAL NEW-YORKER. I had an idea that your publication covered a good section of the extreme Northeast, but letters have reached me from the State of Washington, from Arizona, Virginia, Tennessee, and Kansas. That is going some for circulation, and you are to be congratulated.
Florida. F. M. R.

This general character of THE R. N.-Y. circulation suggested the possibilities of the Subscribers' Exchange. We believe the subscriber in one section could use the surplus of another section with great benefit to both. Ultimately this will come through local farm organizations. It is being done now; but for the present one subscriber can deal with good advantage with another.

Dr. Julian P. Thomas, who has been under Federal indictment for alleged misuse of the mails, failed to put in an appearance when his case was called in the U. S. Court last week, and his bond of $5,000 was declared forfeited by Judge Foster. In 1910 Mr. Thomas was found guilty of violation of the pure food law through his operations with a bread made of uncooked wheat, which he said would cure indigestion. His present difficulty grew out of the Natural Food Company operations. He is president of the company, and it is said his profits were $100 a day. The company made a biscuit, which the doctor said would not only cure indigestion, but enable the patient to reduce the high cost of living by confining him to a sufficient diet of a biscuit, a tomato, and an onion. Some time back some of our people were attracted by the prospectus of the Natural Food Company. Our judgment was rebuked several times because we failed to see the prospect of quick riches and sure health, that Dr. Thomas had promised. The record goes back some four or five years, but those who acted on the information we had at the time, are not now financially concerned with Dr. Thomas' indictment or forfeiture of bail. J. J. D.

Coaxes the Cows To "Let Down" More Milk! Doesn't *Force* the Milk Flow

HERE'S the mechanical milker that uses natural methods—*natural* air pressure. It's more gentle—safer—*less expensive*. Doesn't use compressed air. Therefore, requires but one tank and one pipe line. Gently, thoroughly massages the teats by use of *natural* air pressure. Works regularly—keeping cows quiet and contented. Works uniformly—increasing milk yield.

EMPIRE Mechanical Milker

Milks by Natural Atmospheric Pressure

The capacity of the double or two cow unit is 20 to 30 cows per hour. One man can operate one or two double units. Its use assures quicker, better milking—purer milk—milk free from stable odors or impurities. Write today for full description and pictures of Empire Milkers in use in modern dairies everywhere. Also for our offers on our famous Empire Cream Separators, Sta-Rite Engines and Empire Star Feed Mill.

Don't Be Tied To A Cow's Tail

Hired man a poor milker—he quits or goes off on a spree—all hands drafted in—hours lost morning and night—teams idle—"got to get back for milking." Just as if there aren't 250,000 cows milked twice a day with

The Hinman Milker

—a success for over 6 years, that enables a boy to milk 25 cows an hour, get more milk and cleaner milk. The *Hinman* will save you enough to pay for itself the first year—then 100% to 200% interest. Let's prove it this week. You will have a *Hinman* some day anyhow.

Hinman advantages: one cow milked at a time; no vacuum in pail; rapid pail changing idea, no piping—just a simple drive rod; only two moving parts, visible milk flow; simple method of keeping record.

May we write you the name of your nearest *Hinman* owner neighbor and send you a booklet? A postal will do.

February	1.95
March	1.90

Wholesale prices paid by New York dealers are running $2.01 and $1.91 for B and C. Hotels and restaurants using two to three cans per day are paying five to six cents per quart, single quart prices from bakeries and grocery stores, six to seven cents; delivered milk, nine to 10 cents.

BUTTER.

In the latter part of the week there was considerable increase in receipts of fresh creamery, resulting in a drop of one cent. Buyers who usually would have been in the market for this surplus had already stocked up with high scoring storage. The market on lower grades of creamery and dairy is decidedly weak.

Creamery, extra, above 92 score, lb	34½	@	35
Extra, 92 score	33½	@	34
Good to Choice	28	@	32

Elgin, Ill., butter market 32 cents.
Philadelphia, western creamery, 35 cents.
Chicago creamery, 24@32.

CHEESE.

Business is very light with an increased percentage of poor stock. Prices are cut without hesitation, except on fancy State make. Holders of equally good quality Wisconsin appear ready to meet buyers to move the goods.

Whole Milk, fresh, specials	15½	@	15¾
Average fancy	15	@	15¼

Daisies, Wisconsin	14½	@	14¾
Skims, specials	13	@	13⅜
Good to choice	11	@	12
Poor to fair	7	@	10

EGGS

Fancy nearby whites continue scarce, very few being good enough to meet the top price quoted. A great proportion of the supposedly high grade receipts run in value from 34 to 38 cents. Of medium and lower qualities there is considerable surplus. Small movements of storage are noted at prices ranging from 22 to 25 cents.

Our export of breadstuffs for the 10 months ending with October were $204,216,478, an increase of $33,995,959 over the same period last year. In October alone we shipped 19,000,000 bushels of wheat to Europe.

Orders for 1,000,000 yards of overcoating for France have been placed here at a manufacturing cost of $1 to $1.20 per yard. Specifications for part of the order call for 50 per cent. straight wool and the remainder shoddy or other wool by-products.

*

A Mediterranean steamer with no cargo in the lower hold and 3,000 sheep quartered on one of the upper decks, recently capsized drowning the live stock and 180 passengers. The sea was rough and as the vessel rolled the sheep crowded to one side. While badly listed from this cause the ship was struck by a large wave and upset.

*

The cost of finding the physical valuation of our railroads, as a basis on which to judge whether or not rates should be increased, is estimated at about $50,000,000, $35,000,000 being the railroads share of the work, and the entire $50,000,000 being what the public will pay in one way or another, in addition to whatever increase in fares and freights may be granted. Such an appraisal would be of value but a very short time after its completion, so it would apparently be necessary to make frequent appraisals, or provide a large permanent force of valuation experts and assistants to keep the figures up-to-date.

N. Y. AGRICULTURAL SOCIETY MEETING.

The 75th annual meeting of the N. Y. State Agricultural Society will be held in the assembly parlors of the Capitol, Albany, N. Y., January 20-21.

Dairy Conditions—Prices and Products.

WE have had four years of drought, and to cap the climax had a seven-inch rain in 24 hours, which gave us the highest water ever known, and took everything in the river bottoms; hence we are very short of feed, and a great deal of stock has been shipped out. Good cows sell for about $100. Cream brings 32 cents. Dairymen will carry over all of their cows. WM. RIEHL & SONS.
Washington Co., Mo.

Nov. 9. Most of the milk in this section is made into cheese; some cream is shipped to Milwaukee, while a few separate their milk, make butter and supply private families in Appleton. The latter is our method, supplying private families at five cents per pound above Elgin quotations, also supply buttermilk at five cents per quart. There will be the usual number of cows wintered over this season; only the surplus will be sold. Good grade Guernsey cows bring the most; we realize from $100 to $140 each for what we have to dispose of. Grade Holsteins sell well, but do not bring as much per head as Guernsey cows. The supply of feed is plentiful; had a heavy crop of hay and corn. The majority of the farmers have silos; a great many were erected in the last two years. Quite a few are raising Alfalfa, a crop which does fairly well here. The predominating breed of cows are grade Holstein, with Guernseys next. A very small percentage of the cattle are purebred. A very few of the dairymen weigh and test their milk. In our own herd each and every milking is weighed, and tested monthly. Our cows produce from 325 pounds to 550, of butter a year, and from 5,500 to 11,000 pounds of milk a year. W. G. JAMISON.
Wisconsin.

Subscribers' Exchange

Complying with several suggestions received recently, we open a department here to enable RURAL NEW-YORKER readers to supply each other's wants. If you want to buy or sell or exchange, make it known here. This Rate will be 5 Cents a word, payable in advance. The name and address must be counted as part of the advertisement. Copy must reach us not later than Friday to appear in the following week. No display type used, and only Farm Products, Help and Positions Wanted admitted. For subscribers only. Dealers, jobbers and general manufacturers' announcements not admitted here. Poultry, Eggs and other live stock advertisements will go under proper headings on other pages. Seed and Nursery advertisements will not be accepted for this column.

YOUNG MAN wants work on a farm, cannot milk. Address J. LLOYD DAVIS, Springville, N. Y.

EXPERIENCED FARMER, married, wants position; good dairyman; best references; state wages. K. H., care R. N.-Y.

FARM MANAGER—Open for engagement; thoroughly experienced in fruit and general farming. A. B. C., care R. N.-Y.

EXPERIENCED single man wanted to do bottling and washing in dairy; good wages. QUAKER HILL FARM, Plainfield, N. J.

WANTED—A reliable young man wishes to rent a poultry farm well equipped and stocked; state particulars. R. G., care Rural New-Yorker.

COMMON SENSE EXPERIENCED MANAGER wishes position; salary or shares; married; Cornell training; references. LESTER HAYES, St. Johnsville, N. Y.

POSITION WANTED—As working foreman by agricultural college graduate; understands farm management, fruit, poultry, and general farming; single, good references. Address F. W., care Rural New-Yorker.

FARM MANAGER—Danish, 34, married, no children; college graduate; efficient in all branches; has handled over 100 men successfully; highest character and credentials; absolutely trustworthy, seeks engagement wherein efficient man of highest attainments and efficiency is appreciated. Also single man with equal ability, open for engagement. M. P. MADSEN, 320 Fifth Ave., N. Y. City.

ALFALFA HAY—F. P. ERKENBECK, Fayetteville, N. Y.

CHOICE WINTER APPLES; two dollars per barrel. BENJ. WILLIAMS, Rushford, N. Y.

FOR SALE—Carload chestnut fence posts; price reasonable. QUAKER HILL FARM, Plainfield, N. J.

TEN NEW ROBERTSON chain, swing stanchions; never used; $7.50. CARRYL, Whitehouse Station, N. J.

APPLES, APPLES, APPLES—For choice sprayed Winter Apples. Please order to-day. C. J. YODER, Grantsville, Md.

WANT TO EXCHANGE for four barrels sound winter apples, pair handsome buff Wyandotte poultry. CLIFFORD BEMAN, North Emporia, Va.

FOR SALE—DeLaval Separator No. 15; butter worker, churn, butter-print, used but little; cheap for cash; also maple syrup. C. LANGFORD, Clinton, N. Y.

28 INCUBATORS FOR SALE—All models, 260 and 360 eggs, in first-class condition; reasons for selling, am installing a Mammoth machine; write for prices. CHAS. R. STONE, Staatsburg, N. Y.

GRAPEFRUIT AND ORANGES by express in half or whole boxes, F. O. B. Miami, Fla.; fancy brights at $1.75. Golden Russets at $1.50 per box, with order; delivered prices quoted on request. GEO. B. CELLON, Tropical Grove, Miami, Fla.

WANTED to purchase poultry fruit farm; full particulars. FARMER, care R. N.-Y.

100 ACRES—$2,000; good land, houses, orchard and timber; $300 cash, balance $200 a year. B. B. BAGBY, M. D., West Point, Virginia.

SALE of creamery, real property and water privilege; also personal property, in parts. TOWN HALL, Livingston, N. Y. Dec. 4, 1914, at 1 o'clock P. M.

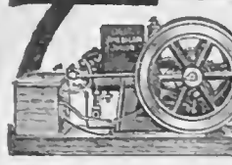
21 ACRE, level, productive farm; nice buildings, only 500 feet from city line of Towanda; finest location in Bradford Co., Pa.; would make a desirable gentleman's place. J. A. JOCOY, Towanda, Pa.

FOR SALE—Farm 85 acres, 65 under cultivation apple and peach orchards, one-half mile of depot and town of 1,000 inhabitants; bargain to quick purchaser. HANSON S. PHILLIPS, Hebron, Md.

FARM 147 acres, productive soil; well watered; good wood lot, handsome 15-room house; prosperous community; best of neighbors; near R. R., churches, schools and stores, $4,000. I. F. GEROW, New Paltz, Ulster Co., R. D. 1, N. Y.

117¾ ACRE ONEIDA COUNTY DAIRY FARM, $4,900; $2,500 cash; balance easy terms; brand new 10-room house, finished oak and cherry, natural; water and sink in kitchen; cement basement barn, stanchion 20 cows; hay track; plenty other good buildings; $500 worth new, heavy oak furniture; all tools, machinery, etc.; 3½ miles to city and railroad; wish to hear only from those interested. Address owner, NORMAN HOOVER, R. 5, Camden, N. Y.

1½ H. P. $29.95



Our misfortune is your good fortune. The war has cut off our foreign trade. We must turn our engines intended for foreign shipment into cash. Stock includes all sizes from 1 to 12 H.P., made of high grade materials and fully guaranteed. Prices are cut to practically cost. The 1½ H. P. price named in this ad is a typical example. Details and complete price list mailed on request.

Overland

TRADE MARK REGISTERED

$850

(Model 81)

Electrically Started and Lighted

THIS is the first car of its size, capacity, power and electrical equipment to sell below $1000!

Though the price is lower than ever, the quality is maintained throughout. All materials, metals and workmanship are of the very best.

This newest Overland has the genuine fashionable stream-line body design.

The body color is Brewster green—always so rich and attractive. It is neatly trimmed with fine hair-line striping of ivory white.

The electric starting and electric lighting equipment is one of the most reliable and best established on the market.

There is also a high tension magneto which is independent of the starting and lighting system and requires no dry cells.

This car rides just like it looks—beautifully. The new, long, improved underslung rear springs give maximum riding comfort under all conditions.

Tires are 33" x 4" all around. Never before has a car at this price come equipped with such large tires.

It seats five adults comfortably, without crowding. It is a big, spacious five-passenger touring car.

It has the famous Overland 30 h. p. motor of remarkable strength, speed, durability and economy, developing more power than you will ever require.

This car at this price is destined to be known as the greatest motor car achievement of the season.

Orders are now being taken for immediate delivery.

Following are a few of the many high-grade features

30 h. p. motor
Stream-line body
Ample room for 5 passengers
Electrically started
Electrically lighted
Electric horn
High-tension magneto
All electric switches on instrument board of cowl dash
Ventilating, rain-vision type windshield
High-grade upholstery
Thermo-syphon cooling
Five bearing crankshaft
Rear axle; floating type
Rear springs; extra long, underslung, 3-4 elliptic
106 inch wheelbase
33 inch x 4 inch tires
Demountable rims
One extra rim
Left-hand drive
Center control
Body color: Brewster green with ivory white striping
Mohair top, top boot, robe rail, foot rest, speedometer, tire carriers, full set of tools, jack and pump.

Handsome catalogue on request. Please address Dept. 127

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

Vol. LXXIII. No. 4284. NEW YORK, DECEMBER 5, 1914. WEEKLY $1.00 PER YEAR.

PLANNING FOR THE FARM AUCTION.

How To Make It Pay.

THE RIGHT TIME.—The time of holding an auction should be considered, for this may go a long way in affecting the returns of the sale. The dairy farmer, if his cows freshen in the Spring, and his territory is a Summer dairy section, should wait until Spring before holding his sale. In a section devoted to Winter dairying, the farmer will observe the situation differently. The most disastrous auction the writer attended was on a beautiful October day. Every farmer realized the warm weather could not continue much longer, and he stayed at home. Those who attended the auction were loafers or farmers who were interested only in the social side of the auction and the free luncheon. Auctions timed in seeding time, in the midsummer, in harvest or silo filling or corn-harvesting and husking time are doomed to be in a greater or less measure a failure. If the weather is good the greater will be the shortage in the footings at the close of the sale. If weather is bad, the farmers will get out, face a bad rain or snow and stand around shivering in a big overcoat at a sale rather than lose time. "It is the worst morning we have had this Winter, and I am going to the sale," I told the family, and I hurried around with the chores, and got started for the sale. The roads were drifted, snow came in clouds, and before I had got far I saw by the way the neighbors were turning out there would be some lively competition. Bad weather is oftentimes of assistance to a sale rather than hindrance, for farmers can do nothing, and the social diversion of the sale and the love of the game of buying brings them to it.

ADVERTISING A SALE.—In advertising an auction, don't go at it in a half-hearted way, for advertising brings the business. The local newspaper and the auction bill are the two efficient mediums of publicity, and if the auction is one of dimensions, if there are purebred animals for sale, the farmer should try the live-stock columns of the farm paper. The larger breeders rely on the agricultural press altogether. Many farmers endeavor to get inside a $5 bill in their advertising and their auction printing. If they would increase their appropriation to three or four times the figure I have no doubt that each dollar additional would return them $25 more in the footings at the close of the sale. One of the largest country sales I ever attended was one where the proprietor spent upward of $40 advertising his farm auction, and he secured buyers from several counties. His returns were several hundred dollars in excess of his anticipations. I know another farmer who had arranged for an auction, and he learned there would be another auction within two or three miles of his farm. He could not secure his auctioneer for several weeks again, and he was anxious to clean up the sale. He went ahead, only he used a heavier appropriation for advertising, and his returns more than gratified him. He declared he would be satisfied with $1,200 as total, but when he figured the sale that night with his clerk, the returns amounted to over $1,600.

THE HAND BILL.—Don't try to economize by using a small bill as large as a sheet of writing paper. It doesn't attract attention, and it shows up "small." Have good bills printed, about the size of two pages of this paper opened out. Get the bills printed on good stock. The printer should have some special manila that is excellent for auction work. This manila will last during the life of the bill, and for months after the sale. Don't try to crawl out with a small expenditure by using some material like light newspaper print stock, for the first little wind will tear the bills to pieces. A farmer whom I know tried the cheap thin stock, and within two hours after posting I saw several of his bills torn to shreds.

THE FARM AUCTION. INTERESTING THE CROWD. Fig. 615.

THE AUCTION LUNCH.—Treat the crowd right, and they will treat you right. Have something warm for the visitors when the noon hour comes, and have plenty of it. Don't give a cold hand-out; give the visitors plenty of good hot coffee. Don't give them skim-milk with it, but cream, and plenty of sugar. Give some sandwiches, cheese, and baked beans. It may take a little extra work, but it will pay, and if you can have some good hot coffee on tap from the time the sale starts, give the fellows a chance at it. There is no question about the shortest road to a man's pocketbook is through his stomach at the time of an auction. I know a farm auction that was ruined because the farmer was close on lunch. He hoped to get through by noon, but the crowd came slow, and at noon the guests began inquiring about the refreshments, and then before the sale was completed the crowd had nearly all gone home. The ladies' aid of the church may ask the privilege of serving dinner, and in such case I know it would pay the farmer to pay them for absolutely every person served and give the dinner free, although when the church serves the farmers generally expect to pay. When it comes to selling pure-bred live stock entertainment is essential, automobile service, and in instances entertainment in the home and at the hotel for a day or two pays the proprietor profits. I attended the sale of a certain breeder who gave a banquet at the leading hotel of his town, the first night of the sale, provided entertainment for all visitors, and meals for the day's sale, and it paid him. At the banquet, every one toasted the host because of his hospitality. If you live any distance from the railroad, see that transportation is afforded both to and from the trains. Advertising this will insure visitors from away.

CONDITION OF GOODS.—Have stock and equipment in good condition. The farmer who has the reputation of keeping poor unproductive animals will find his sale will suffer from it. If his tools are poor makeshift arrangements, only the class of buyers who use that kind of tools will be present. They will want time, too, and their credit is about as unstable as the goods they buy. Have the stock in good shape, don't try to deceive. Don't try to cover up a broken casting with paint, or pass over a weak part of a machine or animal; the crowd may discover, and if it does not, some one later will. The auctioneer cannot afford to be tricky, for he has certain advertising value to a sale. If he is known to "strike off" goods at somewhere near their value he can command the buyer's bidding more efficiently than if he has the reputation of working his crowd for the last penny. If you have a good large sale, do not leave the load to one auctioneer, have two. One can cry, while the other will work the crowds for bids. This is the way the live stock men do it, and frequently they have three or four auctioneers. See that the clerk is careful about the paper he takes. Many notes given at auctions are not bankable, others taken altogether must suffer a discount of as high as 50 per cent., and then they are only held as collateral. The banker is very critical about accepting these notes. See the clerk has all paper endorsed by responsible parties, and make the note as solid as if given to a bank. And if you don't advertise, and your equipment is poor, don't blame the auctioneer. W. J.

R. N.-Y.—Farmers visiting in New York will frequently be interested in attending the fruit auctions, several of which are held every business day, and advertised in the morning commercial papers. This comparatively new phase of auction selling has proven a great success in systematic and economical handling of staple fruits. A study of one of these auctions will show the value of grading and brands

DISPOSING OF THE APPLE CROP.

NEWSPAPER ADVERTISING.—I was interested in the Hope Farm Notes about disposing of the apple crop, as we, too, have had some advertising experience. We had a heavy crop last year, being on high ground where the May freeze did not reach us. It being our first year, with about 3,400 bushels of apples, and not much provision for holding the crop, I put a small classified advertisement in one of our Ohio papers, offering apples at $1 per bushel and $5 for a barrel of select fruit, with the result that we had orders for some 1,300 bushels from two insertions of a plain five-line advertisement, and some sales again this year from the same parties.

HOLDING THE CROP.—Our crop this year is not nearly so large, though the crop is more abundant outside of our own and a few other orchards. At present our markets are full of apples selling at 50 to 75 cents per bushel. Having good storage facilities this year we have made no effort to sell many of our apples, except such as would not keep. We let them hang on the trees as long as possible, having finished picking November 7, and most of our stock will keep well in ordinary cellar storage, until February or later. Even now we are getting a dollar per bushel for some of our best apples, because discriminating consumers have learned that our apples are not in the same class as most of those offered here at lower prices, more or less wormy, and poorly graded. We now have about 1,100 bushels of picked apples in bins in well-aired, cold cellars. When the weather gets bad for work outside we plan to sort and grade these, and they will all be sold in our local market in bushel crates, mostly direct to consumers, at good prices, long before the season that they might be kept is over.

NEGLECTED ORCHARDS.—There are few here who pretend to take any particular care of their orchards, and for the most part they are going to ruin faster than the younger trees are growing up. While there has been a considerable crop of apples here, those saved for market purposes are not a burdensome quantity, and only a small part of which our market uses. A good many carloads of bulk apples are being shipped in here now. The older trees here are mostly of the "sky-scraper" kind—hard to pick. Those that drop are badly bruised and used for cider, or go to waste. Being poorly sprayed or not at all, most of them drop, unless picked early. In contrast, we have low-headed trees, and the fruit hangs on well. We have comparatively few cider apples. We usually sell a barrel of fresh cider on our market wagon about once a week when making the rounds among customers, having the barrel on the back of the wagon with a faucet to draw from, for those who call for a gallon or two for drinking fresh, for mince pies, making spreadings, and vinegar, and this keeps the cider apples so well cleaned up that there is no waste. C. WECKESSER.

Wayne Co., O.

THE "WATER WITCH" ANALYZED.

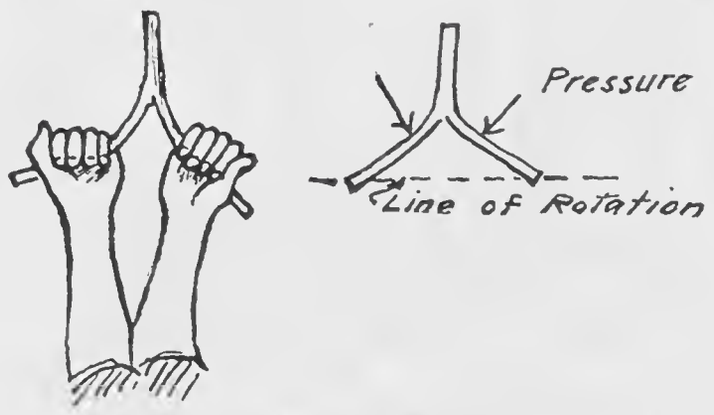
I NOTE "City Ignoramus," on page 204, is in a dilemma when confronted with the "water witch," but think he was too easily "stumped." Usually a little critical analysis will turn a mystery into a commonplace.

In all operations of "water witching" I have witnessed the operator holds the crotched stick in clenched hands with palms turned toward the body and elbows close together. It is an awkward, unnatural position but necessary for successful "witching." A crotch of witch hazel, peach, apple or other wood as suits the individual taste is used. It should be small enough to bend slightly under the fingers.

When operated successfully the free end of the crotch commences to vibrate upon approaching the underground stream, then slowly and irresistably revolves in the grasp until pointing downward, indicating the desired water. Some operators estimate the depth by the bobbing of the twig. At first sight the operations is puzzling, but let us investigate a little.

Hold up your closed fist palm inward. In closing the fingers tightly you will observe that the inner end of the first (at the little finger) moves downward, while the outer end remains stationary. Now you can see what happens when the "witcher" works, as his fingers' close pressure is applied about the middle of the forks from that downward movement of the little finger. If the crotch is held in a vertical position it does not move, but the spring in the forks causes the upright to vibrate, and as soon as it is out of the vertical a lever is in action, and the crotch will rotate around a line between the two fixed ends. The harder one squeezes to keep the twig from turning in the hands, just so much more pressure is applied tending to turn the end downward. If held tightly the bark will be stripped clean from the twig.

If some outside force was really acting on the twig, holding the latter loosely in the hands would only allow more freedom of movement, but as the twig refuses to work under those conditions a "City Ignoramus" might be pardoned for having a few doubts on the matter. The "water witchers" I have seen were all honest in their belief that the instrument worked without effort on their part. They are



THE "WATER WITCH" OUTFIT. FIG. 616.

men naturally gifted in ability to locate water, and the belief that water exists in some locality is involuntarily conveyed to the muscles of the hands, causing the twig to operate.

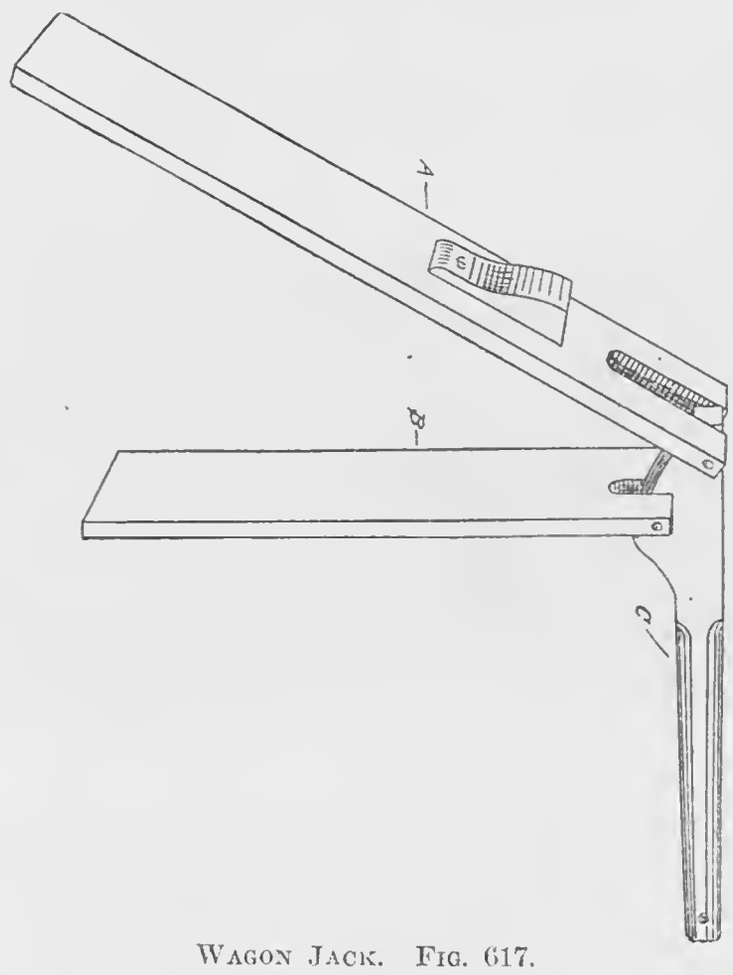
I think I recall an editorial in THE R. N.-Y. wherein the editor expressed himself as unable to decide on the merits of the water witch. That being the case I hope the editor as well as "City Ignoramus" will cut a crotch and try the experiment, proving to his own satisfaction that the water witch is in the same class with the Salem witches of long ago.

Connecticut. LAWRENCE JOHNSON.

A WAGON JACK.

THE ordinary farm wagon, to give the best service, must be kept well lubricated: it makes for easy running and increased wear. Proper lubrication is one of the best horse feeds. Lubrication is too often neglected because of no easy way to apply the grease. It is not at all unusual to see a wagon being "greased" by placing a rail under the axle, and after lifting it up with this lever, blocking it with a piece of board. This is laborious, and consequently the wagon is left to run until it squeaks. I have recently seen a jack that can be made in a short time in any farmer's workshop. The sketch, Fig. 617, shows its construction so plainly that little need be said in regard to it. The one shown was made for light wagons, and for heavier ones would need to be made of heavier material.

It consists essentially of three parts: a piece (A) which carries a support for the axle, (B) which acts as a fulcrum when raising the axle, and the handle



WAGON JACK. FIG. 617.

(C). In use the handle is raised as high as possible and the jack pushed under the wagon until the block on (A) is directly under the axle. The handle is then pushed down and the bolt running through the top of (B) acting as a fulcrum (A) is both pushed forward and raised. The holes in the handle being out of line, the handle locks when in its lowest position. In the drawing (A) is three feet long and 3½ inches wide. The block to support the axle is fastened on by rivets or screws with its top 7½ inches from the top of the piece. A slot is made in the top to accommodate the handle by boring an inch hole through the center of the piece six inches from the top end, and making two parallel saw cuts down to it. A quarter-inch hole is bored through at a point one inch down from the top, through which a bolt is passed to serve as a hinge for the handle. The axle support can be covered with leather, or a piece of old rubber belting to protect the paint on buggies. (B) is made the same width as (A) and in the same way. Its length is two feet four inches. The slot cut in the top is three inches deep. A quarter-inch hole is bored through this at a point one inch from the top to take the bolt that serves as a fulcrum for the handle.

The handle is made from a piece of board two feet two inches in length and four inches wide. This is dressed to 1½ inch wide at each end, and the curved portion shaped as shown. The length of the curved part is nine inches and it is four inches wide at its widest part. The main thing is to get the holes located properly. The first is bored at a point one inch, both from the top and end of the handle. To get the location of the second measure along the top of the handle six inches from the center of the first. Square a line across and bore the hole three inches down from the top edge, and in this line. Put the jack together with a couple of bolts, 3¾x¼ inches. The material used was one inch in thickness. Oak or ash is good for the purpose, but any strong wood will answer. A little study will show how to modify this to fit almost any condition. R. H. SMITH.

Canton, N. Y., Agricultural College.

Overhead Irrigation and Frost Prevention.

PROF. MASSEY'S reply to "L. B. C.," on page 1341, brings up an interesting point I should like to see discussed, namely, overhead irrigation to prevent frost damage to strawberries. I am raising strawberries here on a small scale, and find it very profitable, as late frosts have discouraged many from trying to raise berries, and hence there are few local berries in market. This year's crop averaged me 17 cents per basket delivered to the stores. The two troubles here are droughts and late frosts, and if overhead irrigation will settle both, that remedy is Johnny-on-the-Spot for me. I have already laid plans for an irrigating system of the furrow type of distribution for next year, but shall change directly to the overhead if I can be assured of the two troubles I had feared from such a system: First, lessening the crop by washing away pollen when irrigating to prevent frost damage; second, injury to plants and fruit by scalding from overhead irrigation. At present I protect from frost damage by covering with meadow hay, old burlap, etc., and, of course, this is slow work and only applicable to small areas, in fact, is the limiting factor of our production. I should like very much to get the experience of Prof. Massey and others who have used overhead irrigation on strawberries to protect from frost damage. HAROLD D. PHELPS.

Massachusetts.

R. N.-Y.—Let us have experience in this matter. It is well known that sprinkling or spraying with water will often carry tender plants through a light frost.

Cheap Method of Soil Inoculation.

WE find a number of farmers who realize that a new legume like vetch or Soy beans requires inoculation before it can fully thrive. They object to the cost of the commercial bacteria or of soil from old fields, and therefore lose much benefit from the crop. The *Farm Management Monthly*, of the Department of Agriculture, gives the following account of the way this is managed by some Alabama farmers:

When a new legume is introduced into a locality it often happens that one is uncertain about the land's being inoculated. Many prefer to use soil, from 600 to 800 pounds per acre, from a field in which the legume has been grown successfully. Such fields are rarely within easy driving distance, so that the matter of hauling becomes an item. If, for instance, 600 pounds per acre were to be used on a 20-acre field this would mean six tons of soil to be hauled.

To obviate this expense and trouble a progressive Alabama farmer has adopted the following plan: The year before he sows the whole field he inoculates a strip through the middle and sows this strip to the legume. The remainder of the field might be sown to wheat, oats, or other cover crop. If a good stand results he is sure inoculation is present in the soil covered by the strip. The following season he loads his distributor from the inoculated strip in the center of the field, and then drives to the edge of the field and back, where he refills the machine and drives to the opposite side, continuing the operation until the whole field is covered. In locating the strip to be inoculated the capacity of the distributor should be taken into consideration and the position of the strip so determined that the machine can be driven to the boundary and back to the source of supply without reloading.

"THE Lord loveth a cheerful giver." "Whom the Lord loveth he chasteneth." "Spare the rod and spoil the child."

THERE are not many young people who want to run away from a profitable business. You must make farming pleasant and profitable if you expect the boys to stay with it.

BIG CORN STORIES REVIEWED.

I NEVER saw an article that had more good, hard horse sense in it than the one in reply to G. B., "$140 Per Acre From Corn," page 1234. Corn at 90 cents per bushel, cornstalk silage $2 per ton, corn stover $12 per ton and $20 per ton for cow pea hay may be correct for South Carolina. Our prices here in the mountains of East Tennessee are corn, 60 cents per bushel, corn stover $4 per ton, cow pea hay $12. We make very little silage from cornstalks after the ears have been removed, but $4.50 per ton was what we received last Winter for silage from corn that none estimated less than 65 bushels per acre, the ears went into silo with the stover. Before any man can tell how much profit he was making on land planted to corn that made 100 bushels per acre he must add the cost of plant food removed by the corn crop to the cost to cultivate and harvest the corn; 100 bushels corn will remove:

	Pounds in 100 bushels.		
	Nitrogen.	Phos. Acid	Potash.
Grain	100	17	19
Corn stover	48	6	52
Total.....	148	23	71

The nitrogen at 15 cents per pound would be $22.20; phosphoric acid at three cents, 69 cents; potash at six cents $4.26, or a total of $27.15. Now add this amount to $49.25 and you have $76.30; this from $140 is $63.70 per acre profit. We all know if the corn crop was fed to farm stock and all the manure made therefrom returned to the farmer it might be possible to return to the soil 66⅔, and in some cases 75 per cent. of the plant food removed by the corn crop. And we know also, badly as we dislike to admit it, that as an average for the whole country, north, east and west, as well as south, not over 25 per cent. of the plant food in farm crops, that are fed on the farm, ever sees the field on which it grew, or any other field on the farm.

It may be that some of my R. N.-Y. friends may think 15 cents per pound for nitrogen, three cents for phosphoric acid, and six cents for potash too steep, but nine out of 10 farmers pay more, and when they purchase a complete fertilizer so-called, they pay away yonder more. It would cost us nearer 20 cents for nitrogen and five cents each for potash and phosphoric acid. Yes, sir, you are right. Just such stories as this have led thousands of honest, sober, industrious and frugal men and women to sell out their homes, leave steady employment at fair wages, just to be a back-to-the-landers, with high hopes of getting rich quick; the results we are all too familiar with. We of Crowell Farm are back-to-the-landers, but we went with no such high hopes. Twelve long, hard-working "skimpy" years of our life's best manhood have gone into our fields; each one of them we know by name. We have been fairly successful. Men from a distance have come to see our work, some to ask questions, others to criticize, while others come to "write us up."

I am only a stiff-fingered farmer two score and eleven years young. I get down in the midst of all farm work and fan the clods and weeds; when able, and often when a wee bit of rest would seem to be better. But I never made $140 on an acre of corn, no, not even on an acre of Alfalfa. But we have often made 100 bushels of corn on an average for a whole field. We are now to-day harvesting and housing the corn on a four-acre field that looks as though we are to have 440 bushels of good sound corn for the four acres. O. P. R. FOX.

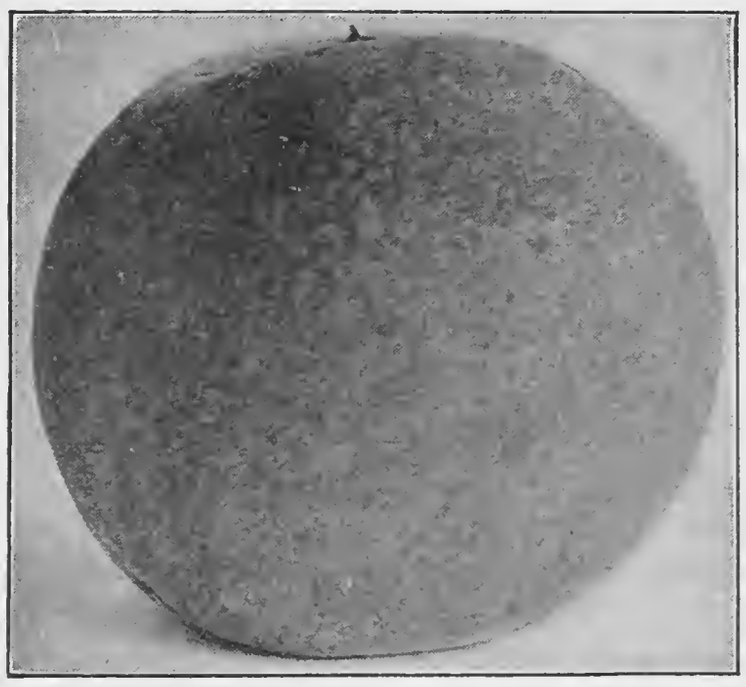
Tennessee.

CITY PEOPLE ON THE FARM.

IT is an odd week when we do not receive at least a dozen letters from would-be back-to-the-landers. There is a new movement away from the city. In a way the European War seems to be partly responsible for this, though in a strange way. Some of these back-to-the-landers have been told that this country must feed Europe, and that every acre of soil must help do this. Every egg, every hen and every potato will be needed, they say. No use telling them that fine potatoes are now selling at the farm for 30 cents a bushel. What does the back-to-the-lander care for that so long as his imagination is free? So they come for impossible advice. They also want to know what to study. Here we can satisfy them. The first thing to commit to memory is Dr. G. F. Warren's pamphlet on "Some Suggestions For City Persons Who Desire To Farm." This is issued by the Cornell Experiment Station at Ithaca, N. Y. It is a sound and sensible statement of the hard facts which one will find in the country. Here is a sample of the straight common sense which fills this pamphlet:

Farming is manual labor. Very few persons make a success of farming who are not workers as well as managers, and these few persons nearly always come up through the labor experience. If a middle-aged person has never learned to do manual labor, such a change is still more difficult. If the members of such a family are very sure that they desire to go to farming, it is safer, if possible, to rent a small place in the country and continue with the city occupation. Some chickens and a cow can be kept, and a garden raised. The family can do most of this work. The small enterprises can be increased, and, if successful after a few years, it may be safe to leave the city work and go to farming.

Another safe method of procedure for a man with a family and small means is to put his money in a savings bank and hire out as a farm hand for at least a year before any of the money is invested in farming. The amount of wages received will not be very large, but the danger of losing the entire capital through premature investment may be avoided. Until an able-bodied person is able to earn good farm wages for some one else, he is certainly not ready to direct a farm for himself—no more so than is a clerk ready to run a grocery store before he can earn good wages as a clerk in that store.

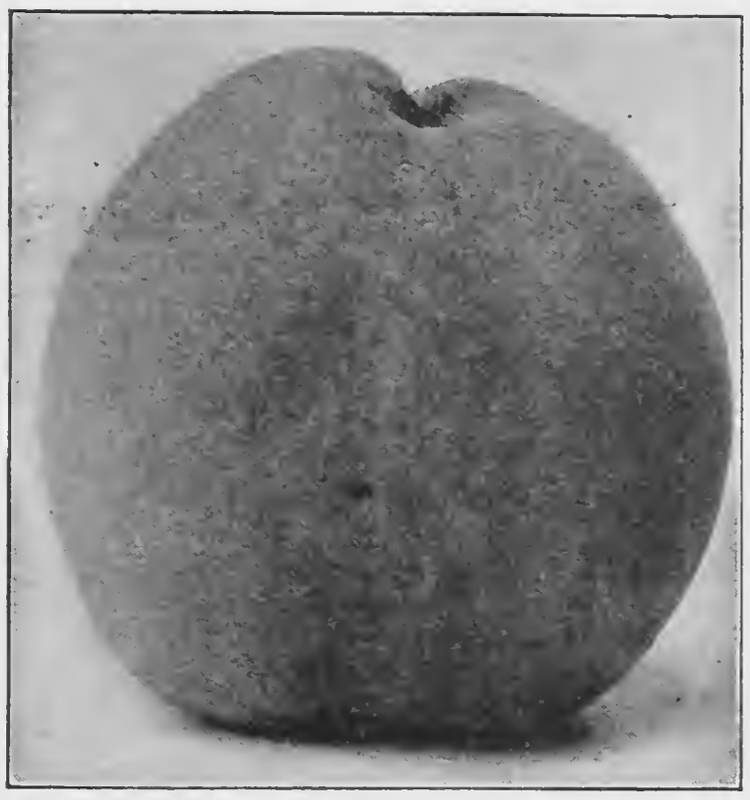


ELROSE PEACH. FIG. 618. See page 1419.

We have been accused of throwing cold water on the hopes of the back-to-the-landers. What would *you* do if you wanted to put out a fire which you knew would destroy your neighbor's property? The writer has gone back to the land twice. We confess that the first trip was a dead and dismal failure, but it gives one the right to say that Dr. Warren's pamphlet is sound.

LIMESTONE AND SLAKED LIME.

THERE ought not to be all this argument about using different forms of lime. The ground limestone men are worst in this respect. You get into trouble right away if you venture to differ with them. Many of them live close to lime quarries where the limestone can be crushed locally, with a short haul to the farm. Some of us must pay high freight rates, and we find that it pays to buy slaked or "quick" lime because we get more actual lime in a ton, and there is no reason why we should pay freight on useless water or carbonic acid! In figuring which form of lime to buy we have reasoned that for immediate results one pound of slaked lime is equal to two pounds of limestone. This statement has been challenged, but a recent experiment at the R. I. Experiment Station shows its truth. Experiments were made in using different forms of lime on mangels and carrots. They used limestone both unsifted as it came from the crusher and also in four different degrees of fineness. Then they used slaked lime—figuring to obtain equal amounts of actual lime in each case. Here is the result, summed up:



KRUMMEL'S OCTOBER PEACH. FIG. 619. See page 1419.

As a general rule, then, it would probably take 200 to 300 pounds of limestone, depending upon its fineness, to produce the same effect the first season as 100 pounds of freshly slaked lime.

Some of the coarse limes gave poor results, but this general conclusion is in line with the advice we have given. It may be said that the ground limestone gives more permanent results. The fact is that most of us, on high-priced land, and spending money freely for chemicals, must have quick results. That is why we use soluble plant food. There are no doubt cases where the slower-acting limes and chemicals would answer, but it is not safe to take results obtained through such methods and apply them directly to other cases where the conditions are entirely different

WHERE TO USE THE MANURE.

I AM undecided as to how to use our stable manure most advantageously. We have a crop rotation consisting chiefly of corn one year, oats or barley seeding with Timothy and clover, which runs three or four years before it is broken up again. We are trying to establish Alfalfa but not with very good results. I am buying a car of ground raw phosphate rock to mix with stable manure, about a pound per cow per day. We also use Soy beans with corn (Leaming) for silage. We inoculate all legumes. I would like your advice as to when to use the manure most advantageously. One farm has its meadows in the Mohawk Valley (Montgomery County), and it often overflows, so that Fall plowing and Winter spreading of manure is inadvisable. On the other farm we have been keeping the manure and spreading it on new seeding after the grain is taken off. On this farm I have been inclined to think it might be wiser to handle it differently. We have used very little commercial fertilizer. Would it pay and what formula would you advise our mixing for grass land? H. A. H.

New York.

In most rotations the manure is put on the sod and plowed under for corn. This crop is thought to be best for utilizing the large amount of organic matter which the sod and the manure contain. Where potatoes come in the rotation, fertilizers, if any are to be used, go on this crop. The plan is to make this "money crop" as large as possible. Where potatoes are not grown and there is much manure used the bulk of it goes on sod for corn, and the chemicals on the grain and grass. The theory of this practice is that corn is the best crop to dispose of the manure and sod, and that the nitrogen in the manure being mostly in an organic form will become available for several years and supply the following crops in the rotation with the help of the chemicals. This plan, of course, means hauling the manure out daily or during the Fall and Winter for spreading on the sod. This means also a fairly level farm, so that the surface wash of water will not take too much of the manure away. Where the meadows are overflowed it would not pay to spread manure during the Fall and Winter. In such case we think it would pay better to compost or pit at least a part of the manure and spread it on the meadows in Spring after danger of flooding is over. A good chemical mixture for such a farm, to use on grain and grass, would be three parts of fine ground bone and one part muriate of potash.

A WELL THAT STAYS FULL.

I HAVE a drilled well 185 feet deep, six-inch casing. The water rises 123 feet, or within 62 feet of surface. When the well was completed it was tested, and could not be lowered. Shortly after being put down we had heavy rains. The water was found to be within two feet of the surface, no doubt surface water. After the windmill was erected and pump started it pumped down to the normal height, 123 feet. This was eight years ago. But it has done this same thing several times. Why does not this water settle down to the normal water level, 123 feet? W. H.

New York.

Any well that yields water is connected with a water-bearing formation from which the water can enter the well with more or less freedom. When the well is not in use the water rises in it to such a level that there is equilibrium between the weight of the water column in the well and the pressure of the water in the rock formation. When water is withdrawn the water level is lowered, and the weight of the water column in the well is diminished. Hence the equilibrium is disturbed and water is forced into the well until the original balance is restored. When a well is pumped the water level is therefore always temporarily lowered, the amount of drawdown depending upon the rate of pumping and upon the freedom with which the water can enter the well. If water is poured into the well the converse process takes place—equilibrium being destroyed by the weight of the water column in the well becoming greater than the pressure of the water outside—and consequently water is forced out of the well into the formation. A well that yields water freely will also dispose of water freely. According to W. H.'s description, his well does not appear to act according to this principle, and without more specific data I am not able to offer an explanation.

GEO. OTIS SMITH.

Director U. S. Geological Survey.

R. N.-Y.—Has any one an explanation to offer??

YOU will see that the Leghorn "favorite hens" at least are doing well. The "Reds" will come along yet.

VAN DEMAN'S FRUIT NOTES.

Wire Gauze Tree Protectors.

HOW close to the tree should wire gauze be, and about how high, as a protection against borers? I should think if it was not tight to the tree the borers could climb up between the tree and gauze. L. P. S.
Lakewood, O.

In applying wire gauze to the base of peach or other fruit trees to prevent the borers from getting in them, it should be of galvanized material, and a very fine mesh. The height should be about 10 inches, and the width sufficient to pass about the trunk and leave a space of an inch or more between the back and the wire. The ends of the little wires should be bent or fastened into the edge of the end of the piece so as to form a closed tube. A wire over the outside at top and bottom is an additional means of security. The bottom should be sunk a little in the ground, and the top stuffed with a little soft grass or excelsior, to fill the space and thus prevent the possibility of the beetles that lay the eggs from getting to the bark to deposit them. Paper wraps are sometimes used, but they are not so durable as the wire gauze nor do they allow the circulation of air nearly so well.

Bosc Pear in Massachusetts.

I WOULD like to have the advice of Mr. Van Deman as to what particular culture and pollination the Bosc pear needs. What pear should be planted with it and would it be profitable to plant compared with the Bartlett or Angouleme in this locality (Southern Massachusetts)? I have about an acre that I wish to plant to pears. The soil is good clay loam. Does a Bartlett need other pears to pollenize? L. W. J.
Rehoboth, Me.

The Bosc pear is not always to be depended on to pollinate its own flowers, although it is not really self-sterile as are some other varieties. But just what varieties are the most suitable to pollinate the Bosc has not been worked out. However, it is almost certain that any standard variety that blooms at the same time with it will serve the desired purpose. The Anjou, Bartlett and Angouleme are profitable and ought to be all right. Bosc should be top-worked on other varieties that are very vigorous and not especially subject to blight, because it is a poor grower and needs the impetus of a strong one that does not readily become diseased. Bartlett bears much better for having other varieties growing near it.

Propagating Nuts; Fertilizing Apples.

WHEN and how should I plant chestnut, oak and black walnut seeds for seedlings to be used in forest planting? Would it be better to plant the nuts in garden and transplant to the woods later? 2. What amount of fertilizer and when apply and what kind should I use for two, three and 15-year-old apple trees?
Port Allegany, Pa. R. C. C.

1. Nuts and acorns of all kinds should never be allowed to get very dry in the Fall or at any time. Nature drops them on the ground and covers them with leaves that keep them moist until they start to grow in the Spring, and then the young seedlings get their water from the soil through their roots. If we will try to follow nature as closely as possible and even improve on her methods in growing forest seedlings we may succeed. The nuts and acorns should be gathered in the Fall as soon as they drop from the trees, and be at once packed in boxes that have holes in the bottom to give good drainage, mixed with damp sand or leaf mold and covered with a wire netting of some kind that will prevent mice from getting in. These boxes should be buried in the earth to their tops and a little trash thrown over them and left to the action of the weather until Spring. When there is the first signs of sprouting of the nuts they should be planted. It is best to plant such forest seeds as nuts and acorns where the trees are to stand, for the seedlings are difficult to transplant. The best of all fertilizers for fruit trees of any age is good stable manure. If this is not available then a mixed commercial fertilizer that contains about one-half acid phosphate, one-quarter muriate or sulphate of potash and one-quarter tankage will be suitable. Trees two to three years old should have five pounds each and those 15 years old 25 pounds each. The time to apply it is not very material, but the early Spring is as good a time for it as any, and may be the best.

H. E. VAN DEMAN.

Cross-Bred Potatoes.

OUR understanding is that in spite of certain claims of potato breeders that they have hybridized or rather crossed different varieties artificiany, this has never been done, although I am not positive that this is true. What is your opinion? V. S. S.

THE R. N.-Y. has referred to this before. But little progress has been made in artificial hybridization or hand pollination of the cultivated potato, but undoubtedly natural cross-fertilization occurs in the field. Even without natural or artificial crossings, potato seedlings uniformly show wide variation. Our cultivated potatoes flower sparingly, and the flowers are often deficient in pollen; if pollen were formed and ripened, and applied to receptive stigmas there seems no reason why complete pollenization should not result. It would seem as though constant tuber propogation had weakened the tendency to form pollen, but that is the only bar to hand pollenization.

THE MAILBAG.

Wintering Salsify.

IN leaving salsify in the ground all Winter should I cover it with dirt or leave the same as parsnips. E. K.

Salsify is entirely hardy, and if it is so desired, may be allowed to stand over Winter in the ground where it grows, with or without a protecting cover of litter. If wanted for Winter use it is better to store it in pits, same as is done with other root crops. Salsify is a good keeper and may be safely stored anywhere that is not wet, nor warm enough to induce growth.

Cement Floor for Granary.

CAN anyone tell me how I can lay a cement floor in my granary without any risk of having the grain spoil next to the floor? C. M. G.
Richville, N. Y.

Unless the soil beneath your granary is unusually wet, a sub-base of field and cobblestones, 10 or 12 inches thick, should protect the floor from undue moisture. If there is danger, however, of moisture coming through the concrete, it may be guarded against by first laying several inches of the concrete floor, then covering it with one or two layers of tarred paper, mopped on with hot tar, after which the floor is completed to the desired thickness. M. B. D.

Buckwheat Straw for Bedding.

I HAVE a lot of buckwheat straw which I intended to use as bedding under the cows and horses. I was told by some of my neighbors that buckwheat straw was very bad to use for bedding, and that it made the cows "lousy."
Centerville Sta., N. Y. J. S.

Buckwheat straw has the reputation of being irritating to the skin of animals bedded with it, particularly that of horses. I have used it for that purpose for some years, however, and shall this Winter. While it cannot, of course, cause lice or parasitic skin disease, I am not at all sure that it is not irritating to the sensitive skin of some animals. One of my horses bedded with it frequently shows a mange-like eruption of the skin in the Spring, but as he has also shown the same condition when buckwheat straw was not used, I do not know how much influence the bedding has had. At any rate, I am not sufficiently convinced of the irritating properties of buckwheat straw to discontinue its use. M. B. D.

Smoke Cure for Skunks.

REGARDING your correspondent's letter, page 1304, would like to add experience for the benefit of others who may sooner or later be in need of it. Thirty years ago I lived in a regular skunk country in Colorado, where during the haying season adventures with skunks were a daily occurrence, plenty and varied, sometimes humorous, always odorous, sometimes exciting, seldom pleasant and most always embarrassing they were. The best, quickest and easiest way to remove the perfume or aftereffects from an encounter with a skunk from inside buildings, clothes provisions, etc., we found a smudge made of green cedar boughs or juniper (cedar preferred). Fumigate the clothes by hanging them up loose around the room or cellar or outhouse. In case the floor is of wood make a fire in an old sheet-iron tub after putting a few inches of dirt in it. After the fire has partly burnt down lay on the green cedar boughs and let her smoke. Close doors and windows but don't let the house catch fire. At that time the county I lived in paid 25 cents bounty for each scalp. They are good eating if you can overcome the prejudice. C. E.
Douglas, Ariz.

"TOMMY," said the Sunday school teacher, who had been giving a lesson on the Baptismal Covenant, "can you tell me the two things necessary to baptism?" "Yes'm," said Tommy, "water and a baby."—Western Mail.

Don't Pay Freight on Water
Spray with Niagara Soluble Sulphur Compound
In Powder Form

This Scientific Powdered Spray Material Assures Clean, Top-of-the-Market Fruit

Dissolves instantly in cold or hot water. Will keep indefinitely in any climate. Will not crystallize. Sticks like paint. Four years actual use has proven it to be the most economical, efficient, practical and convenient spray material on the market.

Every farmer and his wife should read our latest illustrated handbook and learn how to treat seeds with the best and cheapest disinfectant—

FORMALDEHYDE
The Farmer's Friend

It positively rids seed grains of smuts, potatoes of scab and black leg; destroys disease germs in drains, stables, kennels, chicken houses, etc. It kills flies. Endorsed by the U.S. Dep't Agriculture. One pound bottles of Perth Amboy "Formaldehyde," 35 cents at dealers. Write for Book—just issued—free.

The Home Acre

DRAINING GARDEN; RHUBARB; ROSES.

I WISH to drain a small piece of land according to the attached diagram. This soil is the worst kind of clay, being that removed from the basement when the house was built, and remains wet until late in the season. Can you give me any information as to what kind of tile to use, whether glazed or unglazed, what size, how low to place same in the ground, how much drop to give it, how to protect the joints so the tile will not clog up, and just how it should be laid? 2. I would also like to know what would be the best way to bring this ground to a high state of fertility, assuming that I have access to a plentiful supply of sand, manure, fertilizers, etc., and that I will not have access to the ground before this year's truck crop is off. I would like to get next year's crop in at the earliest possible date. 3. How often should rhubarb plants be transplanted and how many eyes should be left in each division when transplanting? After transplanting, how long should the plants be left without picking? 4. Next Spring I want to plant some rose bushes and became utterly confused at the different terms applied to them in the catalogues. Can you give me a brief explanation of the difference between the following: Monthly Tea roses, Hybrid Tea roses, Hybrid Perpetual roses, Hardy Perpetual roses, Everblooming roses, dormant roses? Which of these are hardy in our northern climate, which are grafted stock, and which are likely to give the best results in this climate? I desire to plant hardy roses which bloom well, but which are not grafted stock, if it is possible to get this combination. Any information you can give me will be greatly appreciated. H.

Lakewood, O.

1. I believe the plan herewith submitted for draining this plot of ground will meet all the requirements and prove in every way entirely satisfactory. Where the land is heavy clay and retentive of water, I have always found the unglazed horseshoe tile (one foot lengths) give the best satisfaction, as it will draw off the water much more quickly than round tile. It will require 40 feet of five-inch, 38 feet of four-inch and 70 feet of three-inch tile for this piece of work. Dig the trench 15 inches deep at upper end of main line and laterals, with an even fall to a depth of 30 inches at sewer connection at house. When preparing the trench for the tile, make the bottom as even and smooth as possible, and for the three-inch tile place a one-inch spruce or hemlock board five inches wide in the bottom of the trench, six-inch boards for the four-inch tile, and seven-inch boards for the five-inch tile. Keep the line of boards straight, and place the tiles in their respective sections, on top of the boards with the joints fitted evenly together as possible. If a brickyard is in the near vicinity it will pay to haul brickbats and fill in around the tile and over the top of it to a depth of two inches, and over all place a layer of hay about one inch thick. The brickbats will aid very materially in drawing off the water or drawing it to the tile lines, while the hay will prevent the soil from getting into the tile. If brickbats or stone cannot be obtained handily and cheaply for filling in around and over the tile, then use a covering of two inches of hay and fill in with earth.

2. As a means of improving the soil, I would suggest that you apply a large wagonload of coarse strawy manure and spade it under, and then sow it to rye. If possible sow the rye not later than the first of October, applying at the rate of two bushels to the acre. Spade the rye under in the Spring soon as the ground is in good workable condition, but do not attempt to work the soil if it is the least bit sticky, or you will by so doing render it unfit for vegetable cropping for the next two years. Nothing will put clay soil in as bad and unworkable condition as plowing or spading it up when too wet. After the rye has been spaded under, apply 50 to 75 pounds of air-slaked lime and rake it into the soil. If the soil is quite heavy and there seems likely to be much difficulty in keeping it from baking, about two wagonloads of sharp sand will work quite an improvement in rendering it friable and assist in keeping it from baking down hard. It will probably take three years or longer to make this soil over into a good vegetable garden, but by applying coarse stable manure and turning under green crops as outlined above, it can be done. Do not be discouraged if the first year does not turn out satisfactory. The second year will show quite an improvement over the first year, and the third year will show still a greater improvement. It requires time to bring ordinary land up to a good state of fertility and friableness, for the production of good garden crops.

3. Rhubarb may be left undisturbed until it shows a decided falling off in productiveness, which may occur under certain conditions in 10 years, and under more favorable conditions it may not have to be divided for 18 or 20 years. Two to three-eye divisions are probably the best for starting a new plantation, but if the roots are scarce, one eye will answer. If the transplanting is done in the Fall, a few stalks may be picked the following Spring without injury to the plants. A full crop may be taken the second year after transplanting, and every year thereafter until division and re-establishing a new plantation becomes necessary. Mulch the plants well with coarse manure every Fall, and spade under in the Spring. This will be all the fertilizing they will require.

4. Perpetual or Autumn roses are those blooming more than once during the season. Many of them bloom almost continuously from June until cut down by frost. Hybrid Perpetual or Hybrid Remontants are considered by many as the most valuable and perhaps the most beautiful of all the groups of roses, particularly the hardy roses. This group embraces such well-known and highly-prized sorts as Paul Neyron, Clio Baron de Bonstetten, Capt. Hayward, Anne de Diesbach, Alfred Colomb, General Jacqueminot, Hugh Dickson, J. B. Clark, Eugene Furst, Charles Wagner, Gloire de Margottin and many others. All this class are quite hardy and will succeed where the more tender Everblooming sorts fail. Hybrid Tea roses are mostly crosses between the Hybrid Perpetuals and the Everblooming Tea roses. Many fine varieties are in this group, some of them being quite hardy, but I fear not hardy enough in the Lake Erie regions. All are quite constant bloomers, many having a pronounced Tea fragrance. The Hardy Perpetuals are included in this group. Everblooming roses include all groups and varieties that bloom perpetually, such as the Teas, Hybrid Teas, constant blooming Bourbon and China roses, hardy Polyantha or Pompon roses, also the Rugosa species and some of its varieties, and all everblooming climbers. Dormant roses are those that are not in active growth, or have become dormant at the approach of Winter, and are sold or transplanted before growth starts in the Spring of the following season. The Hybrid Perpetuals, Rugosa hybrids, and the Polyantha hybrids will prove hardy in your latitude. You should be able to get the varieties of these three groups on their own roots. K.

Cannas from Seed.

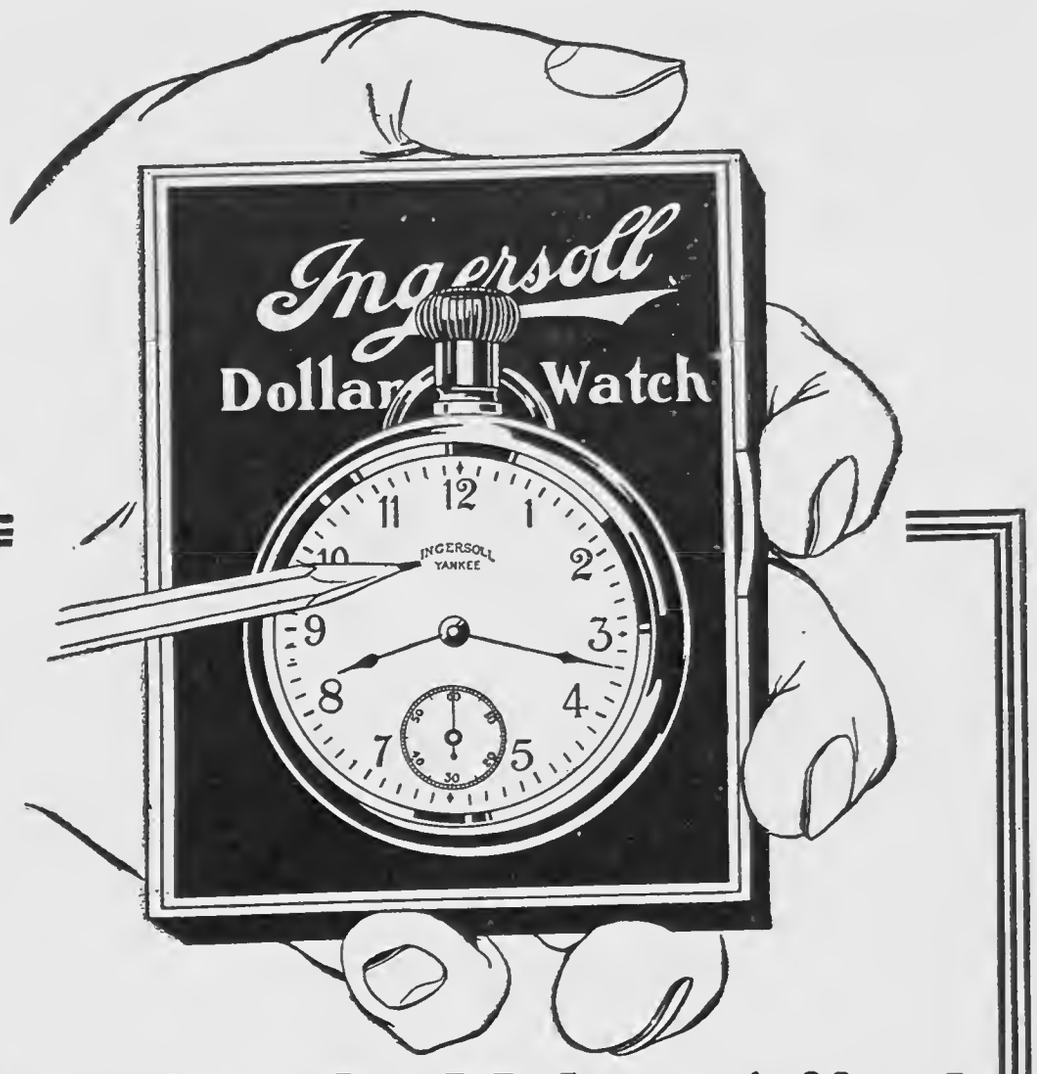
IS it possible to grow Cannas from seed? If so when should the seed be planted? I always understood they were grown from bulbs. J. J.

Closter, N. J.

Canna seeds germinate quite quickly if the hard horny outer covering has a little fissure cut or filed in it, or if they are soaked for 24 hours in warm water. Without these precautions they start very slowly, if at all. In greenhouse culture they are sown in late Winter, with a strong bottom heat, making blooming plants the same season. Under amateur conditions they may be sown in a pan or box set in a warm window, in February or March, or in the hotbed under the same conditions as peppers and eggplants. Commercially, Cannas are almost entirely propagated by division of the fleshy roots, except in raising new varieties, but many amateur gardeners raise them from seed, and thus build up a good stock at very small initial expense, increasing them by division later.

Transferring Wild Bees to Hive.

IN reply to F. M., page 1314, leave the tree uncut until next May 1. Then cut, falling tree gently as possible on brush or by pulley and tackle. Cut out the length of log containing bees and split the same, exposing combs. Bees can be handled then without danger. Fit combs into frames, tying in with string wound round frames. Put in the combs especially containing brood. Sweep bees in front of hive and leave until morning. Next morning early remove hive to position wanted. If a cluster gathers afterward carry in basket to parent hive. Have done this without loss of scarcely a bee. M. J.



How Can the Makers Afford to Guarantee It?

HOW is it possible to sell a watch for a dollar and then if it goes wrong take time in the factory to inspect and repair it, or even to give a new watch for it?

The answer is simple: It would be impossible — if the watches went wrong.

It is only because the Ingersoll Dollar Watch is accurately made in the first place as a reliable time-keeper that will not disappoint its purchaser, that the guarantee can be given.

But, if you buy an Ingersoll watch and it doesn't give satisfaction, there is the big, broad Ingersoll guarantee standing back of the dollar you paid, to make sure that you get a good watch.

Always be sure that the name "Ingersoll" is on the dial — the dollar watch with the guarantee.

Soil Improvement Notes

Fertilizers with Ashes.

I CAN get all the hard wood ashes I want for young orchard and garden, virgin soil of good quality. Will nitrate of soda and these ashes make a complete fertilizer? If not what should be added? How much ashes can be safely used? S. D. E.
Roseburg, Ore.

For young trees the ashes and nitrate will answer for that soil. Two tons of ashes to the acre will be about the limit. As the trees come into bearing acid phosphate or fine ground bone should be added.

Value of Wood Ashes.

WITH the apparent scarcity of potash, would not wood ashes make a good substitute? What is the actual value of wood ashes per ton?
So. Attleboro, Mass. S. H. R.

Yes indeed, wood ashes when you can obtain them at a fair price, will supply potash. Here are analyses of various kinds of ashes. Notice how high in potash corncob ash is. The railroad ties evidently carried much sand. The "average" wood ash is the average of more than 700 different samples.

POUNDS IN ONE TON OF ASHES.

	Potash	Phos. Acid	Lime
Brick yard	75	30	500
Corn cob	500	90	140
Cotton seed hulls	400	160	140
Hay and straw	30	20	100
Tree trimmings	100	50	375
Railroad ties	18	10	50
Sawdust	70	160	680
Seaweed	18	6	120
Wood and coal	8	20	50
Average wood	100	32	640

Treatment of Swamp Land.

I HAVE a piece of swamp muck land tiled, drained and nicely fitted for onions next Spring (about five acres). I have 1¼ tons of potash (muriate) that I expect to put on. I can get plenty of rock phosphate. How much should I use per acre of the latter, and would it be better to sow it on the piece and plow in this Fall? I had oats and peas on the piece, cut for hay. We plowed it after cutting in August and it is clean and in fine condition. I do not wish to plow again in the Spring, and any kind of a cover crop would be in the way in fitting it in the Spring. Would it be advisable to sow any nitrate of soda or use any other form of nitrogen? C. H. W.
Michigan.

We have never seen a genuine muck soil that did not respond freely to lime, and especially when onions are grown. We should try lime on this soil and not use any cover crop. The potash will help—all such soils are lacking in that element. As for the raw phosphate rock we doubt if it will be of much benefit to the onions. This rock may give future results in a soil well filled with decaying organic matter, but a crop like onions must have available plant food for its quick and steady growth. For such a crop we should use acid phosphate or fine bone. A small amount of nitrate of soda will pay on the onions to provide soluble nitrogen until the muck has been well fermented.

Manuring Muck Soil.

HOW can I maintain the proper fertility on muck land? My land is black and rich, but won't grow onions as it once did. R. G.
Oberlin, O.

Briefly stated—use lime. Fertilize with potash and phosphoric acid, and use a little nitrate of soda if the crop shows need of nitrogen. Swamp or muck soils are usually quite sour. They are often rich in nitrogen, but this is inert or unavailable to most plants. A few plants like blueberries or Red-top grass can make fair growth on such soils, but most of our cultivated crops will fail unless the soil is sweetened and fermented. Thus the first thing suggested is lime. One ton or more of air-slaked lime should be worked into each acre after plowing. This sweetens the soil and encourages the work of bacteria which would not be available in the sour muck. This fits part of the nitrogen to serve as plant food. In some cases it may pay to use a small quantity of nitrate of soda. Although the soil may contain as much nitrogen as some brands of fertilizer, yet it may not be able to produce a crop until that nitrogen is "cooked" or made over. In such case the crops would show a light color and fail to grow as they should. If then a small quantity of the nitrate is used this soluble form of nitrogen will push the crops along by giving them what they need. These muck soils are always deficient in potash and phosphoric acid. They may give a few good crops without the use of chemicals, but in time they will be needed. Wood ashes, if you can buy at a bargain, will answer or a combination of three parts acid phosphate and one part muriate of potash.

Potash in Stable Manure.

THE Ohio Experiment Station says: "A ton of average farm manure contains more than 10 pounds of potash, not less than ten million tons of such manure, containing a hundred million pounds of potash, is produced during the six Winter months when farm animals are being fed in stables and barnyards in Ohio. The investigations of the Ohio Experiment Station have shown that, when manure lies exposed in an open barnyard for three months, more than half its potash is washed out by the rain. Even when manure was produced under cover the loss when cattle stood on an earth floor was ten per cent. greater than when the floor was cemented. A few Ohio farmers are preventing this waste by feeding under cover on cemented floors and keeping the manure under cover until it can be spread on the field, but it is a conservative estimate that one-fourth of all the potash produced annually in Ohio stables and barnyards, or twenty-five million pounds, is absorbed by the soil under the stable or yard, never to be recovered, or is washed out and carried into the rivers."

Most of this potash is in the stable liquids which are easiest to lose. That is where the value of absorbents comes in.

Crimson Clover as a Cover Crop.

IN New Jersey I am told that Crimson clover is sown in corn at time of last cultivation and plowed under the following Fall or Spring with great benefit. What could be used similarly in the Mohawk Valley? In New Jersey do they plow the Crimson clover under in Fall or Spring? H. A. H.
New York.

You must remember that New Jersey is a long, narrow State, covering a great variety of climate. From Port Jervis to Cape May is 160 miles, and the lower part of New Jersey lies between the bay and the river, so that the climate is tempered and mild. Crimson clover is quite sure as a cover crop up to Philadelphia. Above that city it is more or less of a gamble—doing well one year and failing the next. In our own farm in Bergen County the Crimson comes through to full success about three years in 10. There may be part of a stand in two other years, but at least half the time this clover is killed out in March. It often goes through the Winter with a good growth during the Fall, but the freeze and thaw of March is too much for it. Covering with manure in late Winter will help carry it through, but the crop is not sure north of Philadelphia, and would be less sure in the Mohawk Valley. Hairy vetch and rye will make a far better cover crop. As for plowing under Crimson or other cover crops good judgment is required. These crops take large quantities of water from the soil in Spring. When the season is naturally moist they may grow to full size, and then be plowed under. In a dry season this would not do as the crops would take too much moisture from the soil. It is better, in such case, to plow the crop under early and pack the soil firmly around it.

Panning Out Gold.

I NOTICE an inquiry by J. P. R., on page 1318, regarding how to pan gold, answered by G. H. A. I would judge by the inquiry that J. P. R. knows nothing about gold mining, else he would know that the pan is only used in prospecting and in cleaning up the concentrates of other methods of mining, and is not a practical way to extract gold any more than a spade would be the tool to prepare a field for grain. If J. P. R. is located on a stream with plenty of water all the machinery needed to work it is a set of sluice boxes and flume to carry the water to them in sufficient volume to operate them on any scale he wishes to, the size of flume and boxes regulated by the amount of water available, or the number of men he wants to work at shoveling. The sluice boxes are made simply by nailing boards together one or more boards wide on bottom, one board high on sides, tapering enough so that the lower end will fit in the upper end of next lower box. The number of boxes needed must be regulated by the character of the ground to be washed, the boxes set at such an incline that the water will carry away the dirt and gravel as fast as it is shoveled in. The gold is caught by means of riffles placed in the bottom of the boxes, and are made in various ways to suit the kind of gold being mined. Some of the kinds used are small sticks nailed on a board, leaving about one inch or two between them, or by boring a board full of holes with a larger auger. These are fastened in the bottom of the boxes in a way readily removable for cleaning up. If the gold is very fine he will need to use strips of blankets with a heavy nap or Brussels carpet fastened at the lower end of his riffles, or by using quicksilver which may be held by boring holes not quite through boards placed in for riffles or by silver plates coated with quicksilver placed under a screen that will carry the coarse stuff over, but will allow the fine to run over the plate. If I can give J. P. R. any further information on this subject I will gladly do so, as I have had experience in the different methods of gold mining in Atlin, B. C., Klondike, and on the beach at Cape Nome.
Pennsylvania. W. E. BATES.

Getting Rid of English Sparrows.

I WOULD suggest to A. C. K., Albany, N. Y., to rid his trees of English sparrows that the trees be wired and a lot of electric lights be put in them and a switch handy to work. Then hang several old tin buckets in the trees in a bunch connected with a rope so they can be jerked vigorously and make a great racket. When it is dark enough that the lights will show well switch on the lights and jangle the tinware, and the birds will leave. Switch lights on and off quickly. If birds are disturbed at their roosting places a few times they will leave. Another way is to string two wires close together on a light circuit, and every bird that alights on them will be killed. The wires must be close enough together that the birds' feet will touch both wires and complete the circuit. Being so close they must be stretched very tight and leave a thin piece of mica or porcelain between for insulation. The trouble with this method is it will kill any bird, but you could switch on the power in the evening for a short time. Using this method a board should be kept above the wires as a wet leaf or snow will give you a "short."
Rosebnrg, Ore. S. D. E.

At night, when sparrows are roosting in the trees, take some Roman candles and shoot them off through the trees where they roost. This will scare them so badly that they will leave for a healthier location. Some obstinate cases may require more than one treatment; it has never failed for me yet. A. J. L. W.
Dutchess Co., N. Y.

Try hoisting a cage with the house cat in it at roosting time. I know from experience that nothing will keep the birds away from a cherry tree like fixing a cage among the branches with a cat in it. The same in a strawberry patch; one or two comfortable boxes for cats to shelter in, tie him to limb with a light chain daytimes, nights let him free. J. S.
Florida.

You want a method of driving out sparrows. I was similarly troubled and will give my remedy. They had taken up quarters in two sugar trees along the driveway, and if one left a buggy under them over night it was ready for washing by morning, so I decided to get rid of them. One evening about dark, when they began to come in pretty thick, I took up a station near the trees with my .22 rifle and a box of cartridges and began a general bombardment of the trees. As it grew darker I came closer to the trees until the real flash would go up among the limbs. They are very persistent, at first, but I kept on firing at random until they quit coming in, and I have not been bothered with them since. You may have to give them more than one bombardment if they have been there long, but I believe if kept up a short time it will effectually rout them. If you live in the city you would have to use the blank shells. I have also read of another remedy which consisted of sending up a shower of fireworks in the trees such as small rockets, Roman candles and pinwheels, which I believe would be equally effective and probably would suit your case better.
C. C. MOONEY.

while time is plenty and labor is cheap

You'll enjoy the winter months far better, if the interior woodwork and walls are bright and beautiful. You'll have greater peace of mind if you know that your wagons and implements are well painted and protected for another year against the ravages of wet and dampness.

For the inside walls you can't beat the economy and beauty of

Lowe Brothers High Standard Mellotone

The colors are "oh, so handsome," and *do not fade*. When Mellotoned walls become dingy, no expensive repapering or recalcimining. Simply *wash them off* and they're good as new. Get our new booklet, *see* the rich Mellotone colors, learn how easy it is to apply and how durable.

For the wagons and implements—there's a Lowe Brothers paint for every purpose

Lowe Bros. Wagon and Implement Paint is especially designed to *stick* in a perfectly protecting coat and give long service.

Lowe Bros. Auto-Carriage Gloss gives a like-new finish. It's easy to use and dries quickly.

Get this new book

The "Farm House Inside and Out" shows 15 fine pictures in colors of actual homes, both outside and inside views. It's just the kind of a book that a farmer appreciates. Tells the facts about paint and painting. Full of good ideas for getting best results in painting houses, barns, woodwork, walls, vehicles, implements. *Free to you.* Tell us whom you buy paint of when you write.

THE REFERENDUM VOTE IN CALIFORNIA.

[In California women vote and legislation is submitted direct to the people before it finally becomes law. At the last election a number of such questions were submitted to popular vote. One was a plan for an eight-hour working day for all laborers. This was opposed by farmers generally. The question of prohibition was submitted and was opposed by grape growers and fruit men generally. Our conviction is that this plan of submitting such questions to popular vote will gradually spread all over the country. The following note on the California election are from an old resident of that State]:

THE vote in the State was a big one—fully twice as big as at any previous general election for State officers. This was owing to the fact that it was the first time the women had a chance to vote at such election. Then, the ballot was a blanket affair—not so much on account of the number of persons voted for, but owing mainly to the 48 legislative and bond propositions placed before the people. Some of these were initiative, some referendum, and some bond propositions from the Legislature. It was a hard proposition for the election officers to count the result easily; many boards where the vote was large became exhausted and gave up. So in this way the counting of the vote has been slow; in some cases the real result will not be known until the various boards of county supervisors have canvassed the vote, or until it is made up finally by the Secretary of State. But it has been so large in many cases that the result is well known, as, for instance, in the re-election of Gov. Johnson; also, the election of former mayor of San Franc. o, James D. Phelan, to the United States Senate, vice Senator G. C. Perkins, of this city, whose term expires next March. (Here I might remark that Mr. Phelan, while a resident of San Francisco, and a man of various affairs there, is one of California's large land owners, and is progressive. I heard him say that when it did not pay him to raise sugar beets on one of his ranches in northern California he had some of the soil sent to the State University to be analyzed. The result was that acting on the report he received he is now getting $35 per acre for rice where he formerly received but $6 to $9 for sugar beets).

The eight-hour law as to be applied to everybody was beaten badly, as also was the minimum wage law for women. I believe the vote was quite close on the latter. The Prohibition initiative law was badly beaten; this was expected long before the election, as it was said that those who launched it were "too previous." It struck at the vineyardists that Californians are very proud of; also, it was thought that it would hurt San Francisco during the big fair next year. This may be all right; I think it is. But the Prohibitionists should have struck at the saloon; let those who wish to drink in a mild way—as you will surely find folk doing in a cosmopolitan population—do so, if they will. When the Prohibitionists initiated their law, I believe the other side launched a couple of propositions, too, one of which was that no election touching the liquor question could be again enacted within eight years following the last. This carried, though I voted against it. I believe there are some jokers in this law that will make the saloons bolder than ever. The saloons may get wise and behave themselves. I think it better for the politics, etc., of the country if every one of them was put out of business, or strongly restricted and made to keep out of politics; make it a penal offense for a saloonkeeper to use his business as a campaigning place.

The last Legislature passed a good "blue sky" law, so called. The crooks, I guess that's the right word, stalled this bill by putting it up to the people on a referendum petition. And here's where the people get fooled. Too often these propositions are so worded that a large portion of the voters are not skilled enough in the English language or are not lawyers enough, to get a clear conception of the proposition. They are just as apt to vote yes when they really intended to vote the other way. So I am sure in the case of the blue sky law, this is the way that a good law for the people seems to be beaten. This State is badly in need of such a law. If it is beaten at the election just ended it is likely it will be passed again by the Legislature; I trust a way will be found to prevent the crooks from again thwarting its provisions.

I notice that one of the effects of the "dry" election in our two northern neighboring States is that the big brewing interests there that will have to remove or close down, are going to locate in this city or near by. The boards of trade says there are millions in it for us. There may be; I don't think so, as we have enough breweries now. W. A. P.

TOMMY came home from school looking depressed. He presented a little note from teacher. Tommy had been very naughty and needed a serious reprimand. "What did you do?" questioned his mother. "Nothing," was the wailing answer. "She asked a question, and I was the only one who could answer it." "But what was the question?" came mother's puzzled but natural query. "Who put the dead mouse in the drawer of her desk," sobbed Tommy.—Woman's Journal.

CROPS AND PRICES.

Nov. 14. Best horses, from $200 to $250; mules, No. 1, $175 to $200; best milch cows, $65 to $75; beef cattle, 5c. to 6c. per lb.; hogs, 10c. gross weight. Butter, 25; eggs, 25; cabbage, one cent a pound; white beans, 6c. lb., colored, 5c. Irish potatoes, $1.25 bushel; chicken, 10c.
Altapass, N. C. C. H. S.

Nov. 15. A large acreage of Winter wheat was seeded, most of which is looking good Wheat was a fair crop, some pieces being extra good. Oats turned poorer than expected. Corn as a rule is pretty good; late potatoes were a bumper crop, bringing only 30 cents a bushel at the car. Wheat is now $1.05 at the local elevator; oats, 55 cents; beans, $2.10 for pea, $3 for red kidney. Apples sold all the way from $1.25 to $1.75, according to grade and variety, quite a lot of fungus being present; hay is selling for $13 for Timothy, $11 or $12 for mixed hay. Hogs 12 cents dressed; veal, 10 cents live weight; beef from 8 to 11 cents by the quarter; poultry, 14 cents for chickens; turkeys, 24; ducks, 20; geese, 16; all dressed with heads off. There is not much movement of live stock and farm produce at the present time on account of quarantine for the foot and mouth disease in this section of the State. W. E.
Akron, N. Y.

Nov. 13. At present the farmer can get 7½ cents per pound for good cotton. For native corn he is paid $1 per bushel. Hogs on foot bring from 8 to 9 cents, or from 13 to 14 cents dressed; pigs, 10 cents. For good quality beef the farmer is paid about six cents on the hoof, for calves in good condition a little more. Milk retails at 10 cents per quart. Country butter brings 25 to 35 cents for best quality. Fruits and gardening crops are not extensively raised for the market in this immediate vicinity except perhaps asparagus, which, in the early Spring, brings excellent returns when shipped for the Northern markets. Our soil and climate are especially suitable for raising of oats; 75 bushels to the acre is not an unusual yield, but I regret to say that most of the farmers do not apply themselves to oat raising extensively enough, being satisfied with a few acres and buying their seed oats annually at 75 or 85 cents per bushel. J. H. L.
Aiken, S. C.

Nov. 16. Wheat, $1 to $1.05; rye, 87; oats, 48; buckwheat, 70; No. 2 corn, 80; beans, $2.50 to $2.20; hay, $12 to $14; potatoes, 25 to 30; pork, 9 to 9½ dressed, live weight, 7 to 7¼; dressed mutton, 8½ to 9; beef dressed, cows, 8½ to 9; heifers and steers, 11½ to 13; lambs dressed 12½ to 13; poultry, dressed, 18 to 22; live, 10 to 11; roosters, 8; eggs, 28 to 32; butter, 28 to 32. We sell our butter and eggs to customers almost entirely at the retail price at the stores as our customers say they can't get hardly any good butter out of the stores, and lots of eggs that are bad. It seems strange to me that the merchants cannot sell better as to freshness of both. I was at a sale of farm property a short time ago, and the cattle were in bad shape, some Jerseys two years old giving milk, but were poor and scrawny, would not weigh 600 apiece; one went for $50 and the others $55. They were purebred, only not registered; one grade that was larger went for less money, and one Poll Durham went for something like $87. Horses are selling around $125 to $225 and scrubs for any price that they can get. Our State tax commissioners are raising the assessments, more than doubling lots of property. Apples are a poor crop in this part of the country this year, although the best farmers spray three times or more. E. K.
Belding, Mich.

Nov. 13. We do not raise enough in this county, Transylvania, of anything to supply local needs, on account of the vast amount of supplies required by the Summer tourists and by the lumber camps and saw mills, and also on account of the neglect of many of the farms because the men work in the woods. Rye opened at 85c. per bushel; wheat opened at $1.25; corn opened at 75c.; dried beans, mixed, all colors, $2.50 per bushel; hay (a failure this year), $1.50 per 100 lbs.; cabbage, fair-sized heads, five cents each. These prices are to farmers. Sweet and Irish potatoes, both $1 per bushel. Butter, made in an old dash churn, and ripening the cream by pouring hot water into the churn (which you know makes it off-color and puffy), sells at 25 to 30c. per lb., and the pounds are very often "14 ounces." We make no cheese. I have sold no cattle lately, but I am told they are worth 5½c. per lb. on the hoof. Pigs, scrub and mixed breeds, at six weeks old, sell for from $3.50 to $6 per head, but it would be a hard matter to buy a 200-lb. hog at any price. The demand for pigs is always good. As for fruit, we have the finest fruit country here, I believe, in the world. I have seen Buffs or Howards as big as my cupped hands, and I wear a 10½ glove. I have seen the Limbertwig, the Winesap and the Winter John kept in this country out in the fields, like Irish potatoes, with a little straw and dirt over them, until Spring. Yet, owing to the negligence of the farmers, in that they will not prune and they will not spray, and they will not organize, there have been fully 50,000 bushels of apples gone to waste in this county this year—could not be "given away" at 25c. per bushel.
North Carolina. JOHN S. BOGGS.

Why WITTE Engine Prices Are So Low

There are three reasons: 1st. I have a natural gas well which gives me free power, heat and light. It costs me nothing and I give all that big saving to my customers. 2nd. I have the most modern machinery, made after my own patterns, which has further reduced my engine manufacturing costs to the lowest possible point. 3rd. I save all dealers' profits and now sell my entire output direct to the user from my factory, which saves easily an average of $6 to $20 per H-P on any size I make.

I know the quality of my engine is right. My many thousands of customers know they work on the minimum fuel cost. I have for years watched the cost of power, by comparison with others; and I know that anyone who gives the WITTE a fair trial will prefer it when all things are considered—**Engine Price—Economical Fuel Cost—and Performance.**

WITTE Gasoline & Naphtha Engine—Stationary Sizes: 2, 4, 6, 8, 12, 16 and 22 H-P. Shown mounted on iron sub-base.

The WITTE is perfectly balanced and proportioned in all its parts so there is no excess friction to overcome—the highest possible percentage of fuel is converted into directly transmittable power. All have detachable cylinders, 4-ring pistons, automobile style vertical valves, automobile ignition, spark shift for easy starting, double weight, extra sensitive, positive governors and other merits without which no engine can now be high grade.

WITTE Kerosene Engine—Stationary Sizes: 2, 4, 6, 8, 12, 16 and 22 H-P. Burns Kerosene, Distillate, Solar Oil, and all like fuels. Also Gasoline, Gas, Naphtha.

WITTE Engine—on Skids Sizes: 2, 4, 6, 8 and 12 H-P. Completely self-contained. Kerosene or Gasoline. Furnished this style.

COMPARE THESE LOW PRICES:
5-Year Guarantee—Easy Terms
2 H-P $34.95 4 H-P $ 69.75
6 H-P $97.75 8 H-P $139.65
12 H-P $219.90 16 H-P $298.80
22 H-P $399.65. Portable and Saw-rig Styles proportionately low.

WITTE ENGINES
Kerosene, Distillate, Naphtha and Gas
Direct From My Factory To Users Everywhere

The WITTE has been the standard of engine quality for 27 years and has established a much lower cost of engine power from the liquid fuels of today's markets. This lower cost operation, in life-long wearing engines, together with my new and remarkably low prices entitles my present offer to the utmost consideration of every engine buyer-user in the country.

Most Valuable Engine Book Published—FREE
Tells you how to judge engine quality—how to decide what size and style engine is best suited for your work. This book is worth dollars to you. Mail coupon today.

EVENTS OF THE WEEK.

DOMESTIC.—Seven bodies had been washed ashore at Grand Marais, Mich., 49 miles east of Whitefish, a point on the south shore of Lake Superior, Nov. 20. The schooner Anna Peterson was wrecked near Grand Marais, and it is supposed that the bodies are those of the crew of the lost boat. It is not believed there are any survivors, as the schooner carried a crew of about seven.

Twenty-five stores were burned and a score of families driven from their homes by a fire which destroyed a block front in the business section at Keanshurg, N. J., Nov. 20. The fire did $25,000 damage.

Fire in a tenement house on East Twenty-ninth St., New York, Nov. 22, caused the death of eight persons. There is suspicion that the fire was started by blackmailers. Another woman who saw the fire, but was herself unhurt, died from shock later.

According to the report of the Red Cross just made public, Americans have contributed about $850,000 to the war fnud of the organization. Of this sum New York's share amounts to $352,087. The national society, the report of its officers in Washington states, still has a balance of $265,000 available for future use in the war devastated countries of Europe.

The jury in the Supreme Court at Geneseo, N. Y., where Henry Siegel has been on trial since November 9 for grand larceny growing out of the failure of his department stores, found Siegel guilty, Nov. 23, of a misdemeanor in obtaining credit on false financial statements. The offense is a violation of section 1293 of the Penal Law. This law was passed in 1912. In finding a verdict on this charge the jury took a course outlined by Justice Clark in his final instructions. Justice Clark said he had serious doubts as to the validity of the grand larceny charge and permitted the jury to find Siegel guilty of the less serious offence. Justice Clark sentenced Siegel to pay a fine of $1,000 and serve ten months in the Monroe County penitentiary.

Forty-three survivors were rescued, Nov. 24, from the wrecked steamer Hanalei, which went ashore in a dense fog on Duxbury reef, nine miles north of the Golden Gate, California. Eighteen dead had been either washed ashore at Polinas, or brought to port by the United States revenue cutter McCulloch and the navy tug Iroquois. How many are missing never will be known, for the best available list gives 28 passengers, and the crew numbered 26, a total of 54, whereas the known dead and saved number 61, seven more than are shown on the company's papers.

Barnett Baff, said to have been the largest independent poultry dealer in this section of the country and hounded for years because he would not join "the trust," was killed, Nov 24, in West Washington Market, New York. The two men who committed the murder ran unmolested to an automobile, which was waiting about 20 feet from the corner, jumped in and escaped.

FARM AND GARDEN.—Great Britain has declined to modify in favor of American manufacturers the embargo on exportation of wool from Australia and other British dominions. It had been hoped that after the needs of the British army had been satisfied Americans might be permitted to buy Australian surplus, giving guarantees that neither the wool nor goods made from it would reach Austria or Germany, but the State Department was informed Nov. 20, that for the present at least no exceptions would be made. It is understood that the decision of the British Privy Council as to wool applies also to rubber.

Capt. R. E. Rose, State Chemist of Florida, testified, Nov. 21, at the trial of E. C. Chambers, president of the Chambers Land Company, in the Federal Court at Kansas City, Mo. The defendant is charged with having used the mails to defraud in connection with the sale of Florida lands. By Capt. Rose's evidence the defence attempted to prove that the Everglades land will grow crops without fertilization. A number of exhibits, consisting of all manner of tropical fruits and vegetables, which had been grown, it was said, on the Everglades lands, were introduced as evidence. A number of farmers in the Everglades also testified as to the productivity of the soil there.

Commissioner Huson reported, Nov. 20, that the foot-and-mouth disease was then confined to 13 farms in New York State. No further serious outbreak was expected. The outbreak at Secaucus, N. J., proved to be serious, and Secretary Houston advised Governor Fielder that all infected cattle should be destroyed. Dairymen there have organized to fight this. New cases were discovered, Nov. 22, on two farms in Brooklyn, N. Y.

The annual meeting of the New York State Sheep Breeders' Association will be held in the Seneca Hotel, Rochester, N. Y., on Wednesday, Dec. 16, at 9 A. M.; President J. C. Duncan Lewiston; Secretary-treasurer B. W. Brace, Albion. All members are requested to be present at this meeting as business of importance will require their consideration. The State Breeders' Association will also meet at this time, as well as the State Dairymen's Association.

THE EUROPEAN WAR.—Nov. 18 a naval battle in the Black Sea occurred between Odessa and Sevastopol between the Russian fleet and the Turkish (late German) cruisers Breslau and Goeben, both sides claiming victory.....Nov. 20 was the sixty-third day of the bombardment of Rheims by the Germans. Many civilians have been killed..... Nov. 21 three British aviators made a flight of 250 miles, 120 miles over German territory, and dropped bombs on the German Zeppelin factory at Friedrichshafen, damaging the factory and one Zeppelin. One aviator was captured. .....A German destroyer, S-124, was accidentally sunk by a Danish steamer not far from Copenhagen, and a submarine, the U-18, discovered and rammed off the north coast of Scotland by a British patrol ship. The crews were rescued.....England admits defeat by the Germans in East Africa, with heavy loss.....Turkey claims a victory over the British at El Kantara, near the Suez Canal.....Flooded areas in Flanders are now freezing, and the fighting consists mainly of artillery duels. The Germans are strongly fortifying that part of the Belgian coast held by them. . . . . The bombardment of Zeebrugge, the German naval base on the Belgian coast, by the British fleet is reported to have resulted in setting fire to the town. The Solvay works, near the Bruges ship canal, are now a heap of ruins, and six submarines which were brought there in sections were reduced to twisted iron. . . . . In France the Germans have made several fierce infantry attacks in the Argonne. The French official report says these were all repulsed. Along the rest of the front there has been desultory cannonading.....Nov. 24 a bomb from a German airship fell in front of the American Consulate at Warsaw, but without any casualty.....Desperate fighting continues in the vicinity of Warsaw. It was reported, Nov. 23, that the Germans had lost many prisoners at Kutno, and the Russians had captured Gumbinnen, in Eastern Prussia.....It was reported, Nov. 25, that the German army advancing eastward from Thorn has been split in two and that the Russians have dislodged the Germans from five towns. German official reports say the fighting continues in north and south Poland without decisive result.....The Portuguese Parliament unanimously adopted a resolution, Nov. 24, to take part in the war on the side of the Allies whenever the time is opportune.....Nov. 22 advices from Pretoria stated that two sons of Gen. DeWet, the rebel leader, had surrendered to Union forces, with a portion of his force.....Italy announced, Nov. 24, that if Egypt is threatened by Turkey and the British close the Suez Canal she will take positive action against the Ottoman Government, which she will hold responsible for damaging her interests. Italy will not tolerate the closing of the canal.....A decision of the British Prize Court in the case of the Miramichi, a British ship, which sailed before the outbreak of war from Galveston, with a cargo of wheat, destined for Rotterdam and thence to two German firms, will have an important effect upon American shipping interests. The court upholds the American contention that the cargo was the property of Americans and ordered its release.

FIVE per cent. greater acreage sowed to wheat in Ohio is the estimated increase over the acreage a year ago. It is estimated at nearly two million acres, in exact figures 1,878,267 acres. The growing condition according to the report of the agricultural commission is above average, or placed at 101 per cent. Corn prospects are 93 per cent. or a little below average. Rye acreage is estimated at 134,789 acres, or 94 per cent. of an average and condition is 98 per cent. of normal. The potato crop this year is estimated at 2,500,437 bushels above last year which was seven million bushels.

DEAN Homer C. Price of Ohio State University, gives figures relative to the new three-year course now taking the place of the two-year course in the Ohio College of Agriculture. The total attendance is 156, of which 122 are from farms and 22 from the business world, and 12 did not indicate calling of their parents. Ninety-one students are high school graduates, 16 are from the grades, and the remaining discontinued their high school work during the course, particularly at the end of the second year.

Governor Glynn has appointed Mr. John J. Dillon Commissioner to organize the new Department of Foods and Markets. Of the appointment the Albany Argus says: "Mr. Dillon's appointment is a distinct example of the office seeking the man. For several months Governor Glynn has urged Mr. Dillon to accept the position, because he considered him the best qualified man in the State for the particular duties which must fall upon a Commissioner of Foods and Markets. Mr. Dillon was an enthusiastic advocate of the creation of this Department. It was only after the Governor pointed out that unless the proper man took charge of it, it would fail to achieve the desired ends, that Mr. Dillon accepted.

COMING FARMERS' MEETINGS.

Ohio-Michigan Land and Live Stock Exposition, Toledo, O., Nov. 22-Dec. 5.

Auburn Poultry Show, State Armory Auburn, N. Y., Nov. 30-Dec. 5.

Michigan State Horticultural Society annual meeting, Kalamazoo, Mich., Dec. 1-3.

Michigan State Potato Show and meeting, Kalamazoo, Dec. 3-5.

Second annual seed exposition, Montana Seed Growers' Association, Bozeman, Mont., December 8-10.

New Jersey State Horticultural Society, annual meeting, State Experiment Station, New Brunswick, Dec. 8-10.

Connecticut Sheep Breeders' Association, annual meeting, Unity Hall, Hartford, Dec. 15.

The Cost of a Telephone Call

DID you ever think how much it costs to give you the telephone right-of-way anywhere, at all times?

Your telephone instrument, which consists of 130 different parts, is only the entrance way to your share of the vast equipment necessary in making a call.

Your line is connected with the great Bell highways, reaching every state in the union—with its poles, copper wire, cross arms and insulators in the country; its underground conduits, manholes, cable vaults and cables in the cities.

You have the use of switchboards costing upwards of $100,000,000. You enjoy the benefits of countless inventions which make possible universal telephone talk.

Your service is safeguarded by large forces of men building, testing and repairing lines. You command at all times the prompt attention of one or more operators.

How can such a costly service be provided at rates so low that all can afford it?

Only by its use upon a share-and-share-alike basis by millions of subscribers, and by the most careful economy in construction and operation. A plant so vast gives opportunity for ruinous extravagance; and judicious economy is as essential to its success as is the co-operative use of the facilities provided.

That the Bell System combines the maximum of usefulness and economy is proved by the fact that in no other land and under no other management has the telephone become such a servant of the masses.

AMERICAN TELEPHONE AND TELEGRAPH COMPANY
AND ASSOCIATED COMPANIES

One Policy *One System* *Universal Service*

Every Call means a Pair of Wires from Subscriber to Subscriber - however many Calls may be made or however far apart Subscribers may be.

TREMENDOUS WOOD GROWTH.

THE SWAN APPLE.—I am a constant reader of THE R. N.-Y. Among other articles several years ago, I noticed that Mr. Frank J. Schwan, of New York, had a new apple which it was alleged the elder Schwan had brought with him from the old country in the shape of a number of grafts, which he had top-worked on a mature tree, and that he had taken a number of these apples to an apple show in New York State and passed them out as samples to different apple-growers, who had pronounced the apple first-class in every respect, but could not name it. After reading this article a letter was sent to Mr. Schwan, with request that he sell some grafts of the tree. His answer was to the effect that he was propogating all the cuttings that he could make from the tree, and that in future years trees could be bought of this variety if he were successful in propagating. Last Fall another letter was sent to Mr. Schwan and he advised that this Spring, 1914, he would have for sale young trees of this variety, which he then named the Swan apple. In due time an apple tree of this variety, was received here. It was a beautiful young tree, standing about four feet high from ground to the first branches. The tree was planted and trimmed and the cuttings were saved in cold storage until the buds began to push. A Black Ben Davis apple tree growing in the lot whose trunk was about two inches in diameter, had four branches, each of which was cut off at the proper distance from the main trunk and a graft of these buds was put on each of the four branches. An article, on page 1178, describes four months' growth of an apple graft, and in an article, on page 1283, there is another notice of a growth of graft, during the season, of five feet, from a Belleflower bud, set the previous August, the first example showing a growth of three feet three inches, and the second one of five feet, during the season. Each of the grafts of the Swan apple set on the Black Ben Davis, just as the leaf buds were beginning to push on the Black Ben tree last Spring, grew, and each one of these buds on each graft shows a distinct and separate bud growth to the length of six feet six inches, not varying an inch and a half in any one bud's growth. To my mind the result is astonishing.

A REMARKABLE GRAPE GRAFT.—To give you another instance of remarkable growth, in our vineyard here we had a seedling grape which measured an inch and a half in diameter at a height of two inches above the ground. Being worthless as far as the fruit was concerned, it was cut off at an inch above the ground and two grafts of Prof. Munson's Captivator were set in the stump and the grafts treated in accordance with A. S. Fuller's advice for Fall grafting. This Spring the covering was taken off, and owing to the position in which the root was standing, the growth did not push until late, but one of the grafts united and now shows a growth of 16 feet. At the same time another large grapevine having a stump diameter of about an inch and a half was cut off an inch from the ground in the same way, and two grafts of Montclair, seedling grape of Corby's were set and treated in the same way. Both of these grafts united last Spring when they were uncovered in March, and each graft shows a growth of 15 feet six inches to 16 feet. Another grape, the Carman, originated by Prof. Munson, was cut off at the same height from the ground and treated in the same way with the insertion of an Iona graft. This was uncovered in the same way this Spring and now shows a growth of over nine feet. Three Delawares and two Duchess grapes were planted in separate holes with the strong roots of a Dogridge resistant vine beside each, and when they grew to the proper length, one each of the Dogridge shoots was inarched on the three Delawares and two Duchess, and they took admirably in each instance. The Duchess grew to a length of about 15 feet last Summer, and the Delawares to over 10 feet each. In June a Horwath method of budding was practiced on a Dogridge with a Quassaic bud. This bud united and the growth from it is over seven feet at the present writing. Another Dogridge in its green state was decapitated in June about a foot above the ground, and a green graft was taken off a Jefferson and inserted, tied with raffia and covered with ground, and this graft has grown to a length of about eight feet. This account is sent you simply to show what wonderful things nature is capable of doing. It is the most wonderful process, and one to be deeply studied and of absorbing interest.

Pennsylvania. JOHN K. GROSS.

Apple Packers and "Kickers."

WE do no often give name and address in THE R. N.-Y., because most of our people do not want us to do so. Here is one, however, to put on record:

N. T. Willis,
Chappaqua,
N. Y.

The point about Mr. Willis is that he wrote a letter to the New York *Sun*, in which he said he could not find an honest apple grower in the East:

The fraud practised in packing apples is a disgrace to the State. Last Winter I paid $6 for a barrel of Winesaps bearing the name of an up-State packer; paid carting and expressage to my home, 30 miles out of town, and got for my pains and expense about a half bushel of Winesaps, while the rest of the barrel was filled with some miserable little yellowish-green fruit or vegetable unfit to feed to the hogs. Every good apple I got cost me approximately 15 cents.

Then Mr. Willis goes on to tell the old story about Western apples of inferior quality—but well and uniformly packed:

This is only a repetition of previous experiences, and I now buy apples only by the box, the Western kind. They are of inferior flavor to New York apples, not old shoes, clods of dirt and other trash. It is not sympathy the New York State apple packer needs, it is something else.

This is hard language. How much of it is deserved? We handle hundreds of barrels of apples each year—all in barrels or smaller packages direct to the consumer. We make a fair price and endeavor to deliver fair fruit. About 10 per cent. or rather more of our customers are "kickers" who are never satisfied and who seem to think they will lose prestige if they ever admit that the goods are satisfactory. What Mr. Willis says reminds us forcibly of the arguments of our small proportion of "kickers." We have tried the experiment of personally selecting the finest fruit of the entire crop. It makes little difference—these customers fear it will be considered a weakness if they do not "kick" about something. The great majority of our customers are fair and appreciative. We do not know Mr. Willis. No doubt he has fair cause for complaint, but there are two sides to this apple business as with everything else.

Weight of Wood.

IN reply to your query on page 1313, I will say that one cord of dry hickory, or maple wood weighs 4500 pounds; White oak weighs 3850; Beech, Red and Black oak weighs 3250; poplar, chestnut and elm weighs 2350; Northern pine weighs 2000. Green wood weighs 25% more. One pound of coal is equal to 2½ pounds of dry wood of any kind.

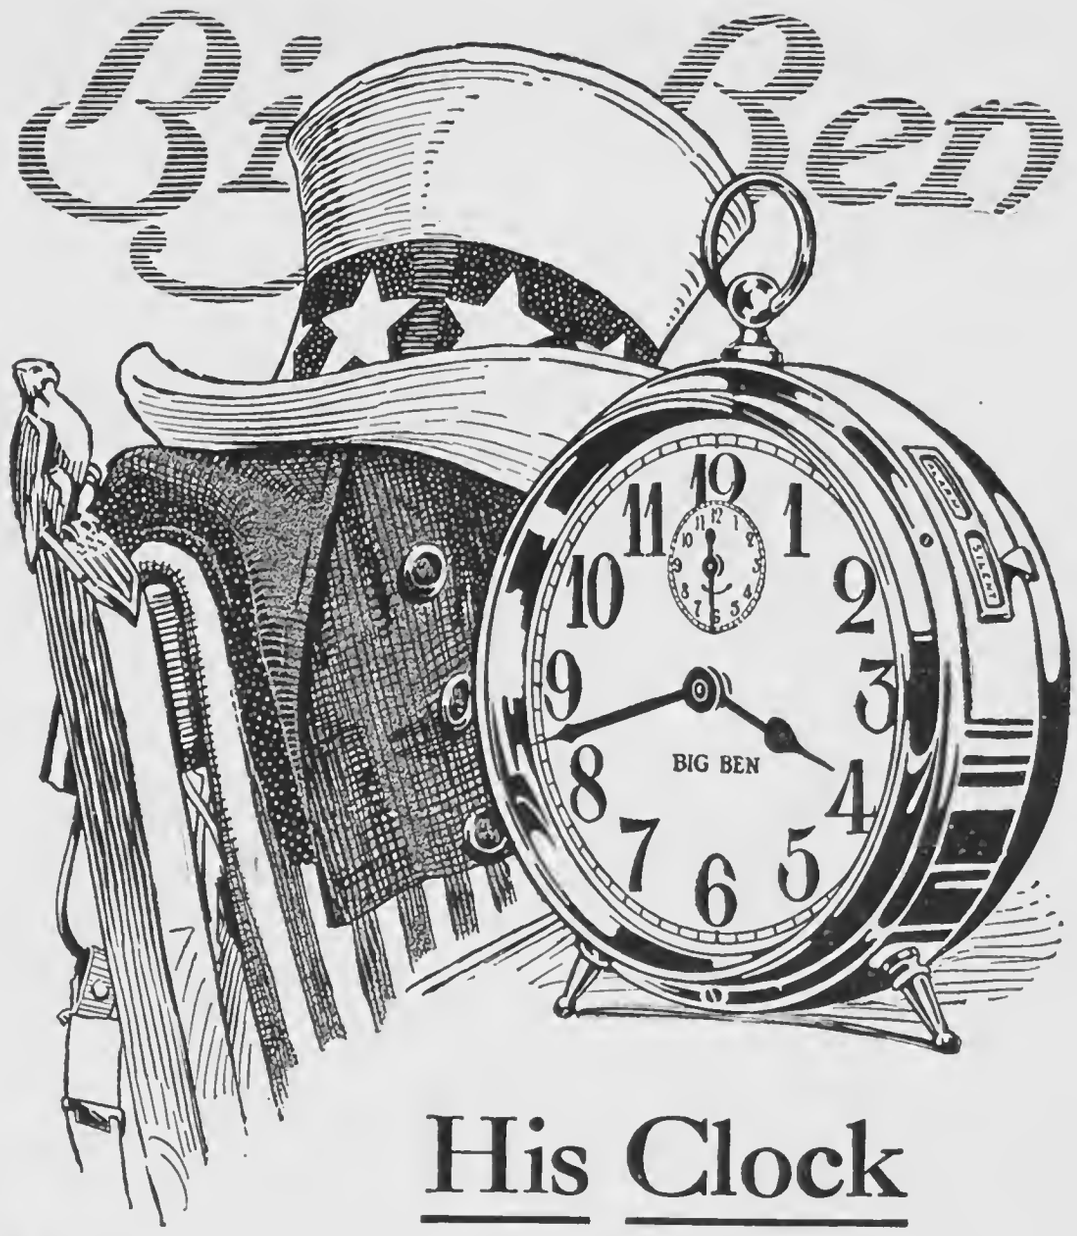
Vermont. EDWIN M. BURDITT.

This information is taken from a book of useful information by William Kent, and is as follows:

Wood when newly felled contains a proportion of moisture which varies very much in different kinds, and in different specimens ranging between 30 and 50 percent, and being on an average about 40 percent. After eight or 12 months ordinary drying in the air, the proportion of moisture is from 20 to 25 percent. The weight of a cord of different woods, throughly air dried, is about as follows: Hickory, or Hard maple 4,500; White oak 3,850; beech—Red and Black oak 3,250; poplar, chestnut and elm 2,350; The average pine 2,000.

New York. C. O. CHASE.

The answer to the question as to the weight of wood on page 1313 can be gotten from the Forest Service, Washington, D. C. The only tables I can find now give the weight of air-dry White oak as 49.94 pounds per cubic foot, and chestnut as 41.20 pounds per cubic foot. According to the size of the sticks and the care taken in piling, wood will run from 30 to 40 to 80 or more cubic feet to the cord. Green timber will weigh from 20 to 40 per cent. more than dry. It would probably be safe to estimate split wood (six-inch face) carefully piled as about 75 cubic feet per cord while limb wood might not be more than one-third as much. ALFRED C. WEED.



His Clock

UNCLE SAM has known Big Ben ever since he was *that high*. Five years ago he chose Big Ben as a likely youngster. Uncle Sam was right—he's made good—he's nationally known.

Big Ben won success in a truly American way—by being on the job every minute of the time. Big Ben has pushed himself ahead by helping others rise.

Uncle Sam asked Santa Claus to buy American goods—suggested "his clock"—*Made by Westclox, La Salle, Illinois,*—and now it's Big Ben for 'most every one on his Christmas list.

Send your "Merry Christmas" by Big Ben—he'll ring it gladly and put heartfelt warmth into his joyous, tuneful greeting.

What's more, his greeting is just as cheerful the next morning, and the next and every *other* morning through the years. He makes his call suit you,—either steady for five minutes or he starts and stops at half minute intervals for ten.

To Uncle Sam, $2.50—in Canada $3.00. If your dealer doesn't stock him a money order addressed, *Big Ben, La Salle, Illinois,* will send him, in a special Christmas package, your card enclosed, and charges paid, whenever and wherever you say

4-BUCKLE One Piece ARCTIC
FOR MEN AND WOMEN, $2.29

Extra quality, very serviceable. Made all in ONE PIECE, with full snow excluding tongue, soles made of best quality pure gum rubber, guaranteed to give lasting service. Tops thoroughly rubberized and lined with pure wool flannel, warranted absolutely waterproof and cold proof. Your local dealer would charge $3.50 and $4.00 for this Arctic. **Send $2.29 to-day** to obtain the greatest value ever offered. We deliver **POSTPAID** to your home. **Men's Sizes, 5 to 13; Women's Sizes, 3 to 8.** Every pair sold with an absolute GUARANTEE of satisfaction or money refunded. State size desired. Catalogue FREE upon request. **A. WEINBERGER & CO., 112-113 South Street, New York. Dept. X**

Waterproof
Not nearly — not fairly — but *dryly* waterproof

TOWER'S FISH BRAND

REFLEX SLICKER

The wet weather coat for you for good hard service. Light weight, strong, and big all over for comfort.

$3.00 Everywhere Protector Hat, 75 Cts.
SATISFACTION GUARANTEED
Catalog free

Hope Farm Notes

HAVE you ever had any knowledge of, or experience with the use of hot water for the purpose of destroying peach grubs at the root of the trees? Is it safe and efficient, and if so at what temperature should the water be? I have a large peach orchard, and we failed to get trees grubbed this Fall. I could go over it rapidly with my spraying tanks if hot water is safe. D. J. M.
Ohio.

We have used both hot water and a hot solution of lye. Neither proved very effective until the gum was scraped away from the base of the trees, as the liquid will not enter the cavity freely when this gum is present. Unless the liquid does work down into the passage where the borer hides, it is not particularly effective. In cold weather the hot water cools rapidly, and does not affect the borer seriously. If the gum is scraped away, the hot lye is far more effective; but we find that if we go to the trouble of working off this gum, it is not much more work to dig out the borer and make a thorough job of it. A forcible spraying with a strong lime and sulphur solution, driven around the base of the tree, with some of the dirt removed, will be more effective than either hot water or hot lye.

The Hope Farm man says he intends to advertise Ben Davis apples for sale. I would give a good deal to see what he has to say in offering Ben Davis. S. K.

I suggest that you give what you call a "good deal" to the Belgian sufferers, for here is what we advertised—leaving out price and address:

"BERGEN COUNTY APPLES.—Our Baldwins are all sold. We now have Black Ben Davis. This is a high-colored apple, a good keeper, but not high quality. We pack in scant half barrel baskets. All hand picked. No. 1 is large size—no other difference."

Later we added to this that for 10 cents we would send samples by parcel post. No one has any right to find fault with such an offer. We had about 300 baskets of the apples to dispose of, and they are going quite readily. The Black Ben Davis is a little higher in quality than the original Ben, and the tree is surely a sturdy grower and early bearer. I shall not plant any more, and if any of them are sold the buyer will know just what he is taking. Perhaps S. K. thinks I should advertise Black Ben about as follows:

"A RED FRAUD.—Ben Davis, a combination of cork dust, sawdust and beeswax—treacherously colored with Baldwin red and Northern Spy stripes. Handsome in color but dry as a bone in flesh and taste. Will keep like potatoes and eat like turnips."

Now I think such advertising would attract more attention and sell more apples than our modest statement. The fraud in selling Ben Davis comes in leading customers to think its quality is as high as its color. When they know what to expect they will not find fault and generally say the apple is better than they expected. McIntosh is our apple, but having planted the Black Bens I intend to dispose of them honestly.

THE BELGIANS.—As we come nearer and nearer to Christmas the heart of this great nation goes out to the unhappy people of Belgium. No matter what side one may take in the present fearful war, we can all agree in considering the fearful calamity which has fallen upon this unhappy little nation. Battered and ravaged, burned and robbed, this jewel of a country lies in ruins. Who can think of any sadder Christmas than the one approaching the homeless and destitute Belgian people? It is no wonder that this great country, the only one which can derive any material benefit from the war, should come forward to help this destitute sister nation.

Among other plans suggested is that of bringing children or families to this country. One of our readers offers a house and 25 acres of good land to a worthy family of Belgian refugees. He will provide land, house and outfit—the family to give him one-third of the crop. Many others are trying to organize plans for bringing back shiploads of orphan children to be adopted or cared for here. It seems that many worthy people are willing to take these little ones into their homes and care for them. It seems impossible to express the admiration which Americans have for the brave people who have endured so much for their country.

In all this, however, few seem to have considered it worth while to consult the Belgian people themselves. In a general way it seems as if about all there is to do is to go over and get the children and bring them here. I have talked with intelligent Belgian people who have come to this country, and they all agree that the best thing this nation can do is to help these unfortunate people where they are now—in Holland, France, England and at home. The Belgian people do not want to leave—they do not want the children to go. When the war is over they want to go back and rebuild their beautiful country once more, and they will do it if they can be helped during the present terrible pinch. So many men have been killed or crippled that the value of a human being in Western Europe will be well nigh doubled in the future. Every child and every adult will be needed to wipe out the scars of war and make new homes. In this land with only a few generations at best behind us, we cannot fully understand what country means to this brave and true people. The best of their future is at home, and their great work will come in rebuilding their country when the war is over. It is a noble thing to offer to take these children and care for them, but I fear we do not quite understand the feeling and spirit of the Belgians and their desire to keep all their people together. I would be wiling to help with some of these children, but I do not think this is the best way. I would give all we can of money and clothing and food to care for the destitute where they now are, but I would try and keep the people of this brave little nation together—for the world sadly needs what they will give in the future as the result of their suffering and patriotism. But let us remember them at Christmas in the most substantial way we can.

I have a garden, the soil of which is very hard and stiff. It has been suggested to me that the condition of the soil can be improved by the application of coal ashes. Will you advise me whether or not this is true? If so, should the ashes be sifted or not? If applied, to what extent, that is to what depth? F. D. W.
New York.

The coal ashes contain little or no actual plant food. A ton of anthracite coal contains only about three pounds each of potash, and of phosphoric acid. Unlike wood ashes, coal ashes have no value as a fertilizer. They do, however, have a useful effect upon certain soils. The ashes should be sifted and only the fine dry ash used. Four or five tons to the acre can safely be used. I should plow or spade the ground, then dump on the sifted coal ashes and work them thoroughly into the upper surface. On light sandy soils the ashes work in between the coarse particles of the soil and thus make it more compact and better able to hold water; on the heavy clay soil the fine ashes have the opposite effect. They open such soils, make them more porous and thus fit them better to give up their plant food and sustain crops. This effect of the coal ashes is physical, and when properly used they will make over the soil and render it better able to take care of the crop, but do not think that they add plant food as fertilizers or manures will do. I use such ashes around fruit trees as mulch, or a mound at the base of the trunk.

I want to know the best way to keep Winter apples in an ordinary cellar, whether to leave them in barrels in which they have been shipped, or to lay them out in open bins. C. C. T.
Pennsylvania.

First the cellar. It must be dry and uniform in temperature. I have learned that a cellar with a concrete top is worthless for keeping fruit. So is a cellar where there is a stove or furnace. If the cellar is dry and unheated we open the windows at night and close them by day. Use a thermometer and try to keep the temperature below 40. Packing in open bushel crates or boxes is the best method we have found. The smaller open packages keep better than bins or barrels. They should be looked over now and then and the decayed stock taken out.
H. W. C.

Breeding Pheasants.

ON page 1329 I notice an inquiry in regard to pheasants, and think our experience, of five years may be of interest to some of your readers. Starting with four pairs we have increased our stock to about one hundred birds, and have disposed of a considerable number to fanciers in several States. We have found them easy to raise, hardy, light feeders and a constant source of delight and wonder to our visitors, owing to their brilliant plumage.

Our runs are 12 by 24 feet, entirely inclosed in wire, both sides and top, while in even the most severe weather they have required no other protection than small open-front houses. As they are naturally a wild bird we have found it impractical to keep them in the open, as may be done in the case of domesticated fowl, and this is impossible, in New Jersey, owing to the game laws, under which, when once liberated, they become the property of the State and private ownership ceases. There is a constant demand for the eggs, particularly of the brilliant Mongolian breeds W. B. LLOYD.
New Jersey.

Preventing Trespass.

CAN you tell me what is necessary to be done to keep hunters and fishermen off a farmer's land in New York State? The farm is in Sullivan County, and it is desired to put up signs forbidding hunting, fishing and trespassing. Does the law require the use of any special phraseology? Must the owner file a notice with any public official? I have heard that such signs must not be attached to trees. Is that so? F. M.
Rutherford, N. J.

The land can be simply posted or it can be made a private park; the difference being that the notiees in the latter case must state that the land is a private park and a notice describing the farm and stating that it is established as a private park to propagate and protect fish, birds or quadrupeds must be published once a week for not less than four weeks in a newspaper published in the county where the land is situated. No water that has been stocked with fish by the State since April 17, 1896, can be included in a private park, and fishing cannot be stopped in such water. Trespass on the banks of such a stream or pond can be stopped.

Notices or sign boards not less than one foot square must be conspicuously posted and maintained not less than 40 rods apart close to and along the entire boundary, and there must be at least one such notice on each side and at each corner and where the boundary runs along or under any water the nearest shore within the park shall be considered the boundary for the purpose of posting notices. Any person who trespasses on such lands after the notices have been placed or after having been served in the name of the owner with a written or printed notice containing a description of the premises and warning all persons against hunting, fishing or trespassing thereon is guilty of a misdemeanor and is liable to exemplary damages in the sum of $25 for each offense or trespass to be recovered by the owner of the lands or of hunting or fishing rights thereon with the costs of the action in addition to actual damages, all to be recovered in the same aetion. The consent in writing of such owner to hunt or fish on said lands during the open season is a defense to a prosecution under this law.

The law makes no mention of any special wording of the notices except that the published notices and those served on trespassers must describe the premises and state that trespass is forbidden and in the case of private parks the published notice must state that the park is established for the protection and propagation of fish, birds or quadrupeds. The law simply says that the notices must be placed close to the boundary. It does not mention trees. A. C. W.
Wayne County, N. Y.

Public Land Sales Active.

IT is sometimes stated that all the public lands which have any value have been taken up. Not so. Secretary Lane, in an advance statement from his annual report, calls attention to the fact that since March 4, 1913, settlers have made entry on nearly 20,000,000 acres of public lands—an area equal to that of Connecticut, Massachusetts, New Hampshire, and New Jersey combined. During the same period practically as much more coal and other mineral land of the West has been examined in detail in 40-acre tracts by the Geological Survey, and most of it has been thrown open to settlement or purchase. Some of these lands, such as those which include workable deposits of phosphate or oil, are still withdrawn pending suitable legislation for their disposal or use. Another important activity in public-land classification to which the Secretary calls attention is the designation of lands for entry as "enlarged" or 320-acre homesteads. Designations under this law approved by him cover 33,453,056 acres.

Lessons Come Easier

IF the child has a big, generous light to study by. The

Rayo

lamp saves eye strain. It is kerosene light at its best—clear, mellow, and unflickering. The *RAYO* does not smoke or smell. It is easy to light, easy to clean, and easy to rewick. The *RAYO* costs little, but you cannot get a better lamp at any price.

MISSOURI FRUIT NOTES.

GOOD PEACH CROP.—The past season was phenomenal, giving us a full crop of peaches following the very heavy one of last year. It was not expected, and a severe frost that struck the trees while in bloom was thought to have made failure certain. However, it was soon discovered that a live embryo could be found now and then and, as usually happens, these sporadic cases finally combined to aggregate a large crop. The droughty Summer seemed to be congenial to the peach. It was too dry for the rot fungus to develop, and the thinning that the frost gave resulted in uncommonly fine specimens of fruit.

MAYFLOWER AND DEWEY.—The first peach to ripen here was the Mayflower about June 25. In common with all its tribe of extra earlies it is too insipid to compare with later sorts, but its extreme earliness and attractive appearance make it a good seller and profitable. Next came the Dewey, July 20, which has made a good record here since it began bearing. It is a large yellow fleshed peach as large as Carman, with yellow skin overlaid with dark crimson, which makes it handsome in appearance; the quality is good, better than any of its season, and it has proved a reliable bearer.

OTHER EARLY SORTS.—The Red Bird has not fruited here, but a Texas friend says that its high color and size makes it a great seller, and that in his section it is paying off mortgages and buying automobiles for its growers. The Early Wheeler, coming in a little later, is another money-maker. It is the largest of the earlies, as large as Elberta, fine color, good shipper, trees sure yielders and vigorous but quality poor. Arp Beauty, he tells me, is the best of the earlies in quality but the color is dull and it runs small unless fruit is well thinned. Following the Dewey here without a break comes the Eureka, a good medium-sized peach on a tree that is claimed to be exceptionally hardy, having withstood 32 deg. below zero. Ripe here July 25. As it goes out there comes in the Alton, a considerably larger peach of fine quality and appearance, a white-fleshed freestone, good shipper. This variety also has a reputation for hardiness and regular bearing, exceeding the Elberta in these respects. Following the Alton closely comes the Belle of Georgia, another favorite kind that never fails to present us with a crop whenever there are any peaches to be found, a heavy bearer of large showy fruit. We prefer it to the Elberta of about the same season.

MID-SEASON.—The Carman comes in rather between the Eureka and Alton and is certainly a fine market peach. About a week later there begins to ripen a peach but little known but which has made a splendid record here. I refer to the Elrose, a creation of the well-known horticulturist J. W. Kerr of Denton, Maryland, deceased, from whom I procured the trees direct. It is a cross between the Elberta and Mountain Rose, hence its name. This variety which comes in as the Carman goes out, is superior to that variety in size, quality and vigor of tree. The Elrose makes a very large peach and in quality is first class. Trees planted 12 years ago with the Carman are showing much greater size of trunk and spread of top than the latter and in consequence yield larger crops. We are much impressed with the Elrose here and regret that it has not been extensively tested.

KRUMMEL'S OCTOBER.—A peach which ripened here for the first time and made a sensation with its size and beauty, is Krummel's October. The young tree set so full of fruit that it had to be thinned of a half bushel. During the dry Summer they remained very small, but after the rains in August they grew rapidly and towards the last of September began to color. By the first of October they appeared fully grown and colored, and a more beautiful crop of peaches I have never seen on a tree. They were uniform in size and equalled the largest specimens that had been seen during the season. A number of them averaged 11 inches in circumference. In brilliancy of color I have never seen them excelled and rarely equalled. The quality, too, was very good. The flesh was a deep yellow, juicy and delicious. For firmness and long-keeping quality they were incomparable. One was accidently dropped on a concrete pavement and no perceptible bruise resulted. For 10 days or more they hung on the tree in the prime of shipping condition, and were not then soft, but if picked and laid away, they would in two or three days become mellow. Our Italian fruit dealers when shown a specimen, offered 2½ cents each and were eager to get them. We sold them $1.70 worth after home requirements.

L. R. JOHNSON.

Cape Girardeau, Co., Mo.

Holiday Decorating Materials.

A MACHINE for winding festoons of holiday greens winds two yards a minute, winding with wire on a core of wire or other material. The machine costs $5.

Holly wreaths of standard size are made on 10-inch wooden rings, wrapped with wire, with four or five bunches of berries. Advance trade quotations the middle of November were $10, $12.50 and $15 per hundred, according to quality and weight. They are packed in cases containing 100 up to 250 wreaths. Sometimes other wild berries are used in making the wreaths, where the holly is poorly berried, but this is rarely satisfactory to the purchaser.

Delaware holly is reported to be very glossy and well-berried this season. Advance quotations were $3 a case; extra quality $4. Cases are 2x2x4 feet. These prices are usually fluctuating.

Boxwood wreaths are sometimes made like the holly, selling for $10 and $12.50 per 100. Boxwood sprays were quoted at 15 cents a pound, or $7.50 a case.

Partridge berries are among the newer offerings, selling for 10 cents a bunch of 50 sprays.

Mistletoe comes quite largely from Virginia, North and South Carolina; it is packed in hampers, barrels and cases, and quoted, advance wholesale prices, at 10 to 15 cents a pound. The hampers hold about 10 pounds.

Ground pine or Lycopodium is sold loose, by the pound, at 12½ cents; wreathing six to 10 cents a pound, according to weight and quality.

Christmas trees from Maine and Vermont were quoted wholesale at 50 cents to $3 each; little trees, 18 to 36 inches high, 25 to 40 cents each. A considerable area now quarantined for moth infection is out of the market for Christmas greens.

Cedar and pine wreaths are made on wire of various sizes; long-leaf pine is sold by the spray.

Iridescent pine cones at 60 cents a pound are among the decorating novelties; they were used a good deal in Autumn work.

Golden Retinispora sprays are new among greens; they are very graceful and feathery, and are offered for 30 cents a pound.

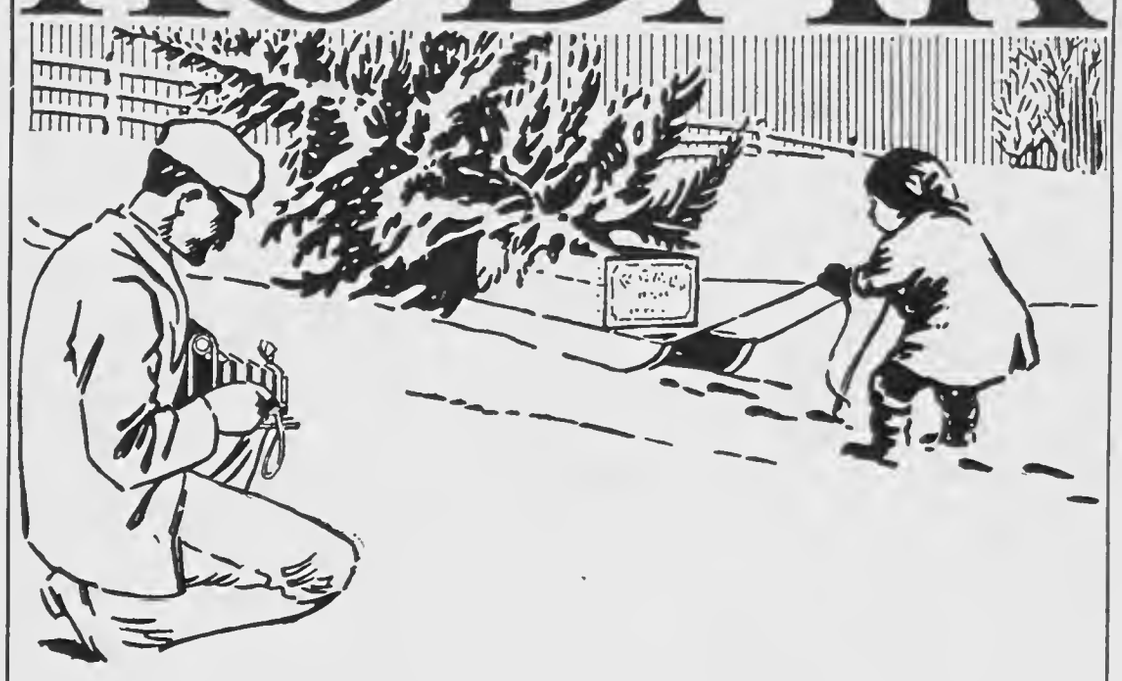
Ruscus or butchers' broom, natural prepared oak sprays, beech sprays and Magnolia leaves, red, green, brown and purple, occupy a distinct place, as their use is not confined to the holiday season, but forms a decorative feature throughout the year. The natural prepared oak leaves are particularly handsome, and were very largely used with Chrysanthemums. We are often asked about marketing these leaves, but are unable to recommend an outlet. One large firm preparing this foliage is located in Indiana, and they appear to rely on nearby stock for supplies. Mature foliage curls very quickly when shipped, and becomes extremely brittle. This prepared foliage looks as though freshly cut, yet remains in condition for decorating use.

E. T. R.

LANCASTER, PA., FLOWER SHOW.—Our local florists' society has just ended a busy week, as we held our first flower show in Lancaster, Nov. 6-7. Our organization is not a large one, about 50 members, and we had many misgivings regarding the outcome; in fact we were rather pessimistic about it. The result far exceeded the expectations of any of us, and was an unqualified success, both as an exhibition and financially. It showed conclusively what can be done if each one helps a little, and all work toward one end. If groups of farmers and truckers could work together in the same manner I feel sure the 35-cent dollar would soon get nearer the 50-cent mark. Though, of course, the 80-cent mark would be better.

Lancaster Co., Pa. ELMER J. WEAVER.

KODAK



Of all the gifts at Christmas

none is appreciated more than a Kodak or Brownie Camera.

The pleasure of taking pictures—the delight in developing and printing them yourself, at home—the joy in showing them to your friends, is slight in comparison to the comfort they are in recalling pleasant incidents that have passed.

KODAKS, $6.00 and up.
BROWNIE CAMERAS, $1.00 to $12.00

Catalogue free at your dealer's, or by mail.

EASTMAN KODAK COMPANY,

387 STATE STREET, ROCHESTER, N. Y.

HORSE HEAD

INCREASE THE VALUE OF YOUR FARM with Pulverized Rock Phosphate, HORSE HEAD brand. Mix 2 lbs. per head per day and increase the value of your manure 75%. Write us for delivered car load price.
HASEROT LIME & PHOSPHATE CO., · CLEVELAND, O.

"Cash In" This

Use the Coupon!

This Book Will Open Your Eyes

It will give you the opportunity to get all the lumber, doors, windows, flooring, mantels, moulding, shingles, roofing—everything you need to build or repair any house, barn, garage or any building—and get it all at *half the regular prices*. And every stick of it *new* goods—fresh from our own mills—*finest* quality. Satisfaction absolutely guaranteed. Our responsibility vouched for by 4 of New England's biggest banks. We even *guarantee safe delivery!*

Split in Two Cost of Lumber—Mill Work for Building or Repairing

The Big Book

You will actually *pick your own pocket* if you fail to get this book before you pay out a penny for any building or repairing. Our enormous business enables us to save you much more money than you expect! Get the book—and see for yourself. Mail coupon *now*—this moment.

Lowest Prices Ever Made on World's Best Roofing

Once you have laid Edwards Tightcote Galvanized Steel Roofing your roofing expense for that building is at an end. Its cost per square is the lowest ever made. It has no upkeep cost. Always beautiful in appearance. Reduces cost of fire insurance.

Reo Cluster Steel Shingles

EDWARDS Exclusive Tightcote Process

Makes Rust-Proof Roofing. Edwards Metal Shingle, Metal Spanish Tile, Edwards Reo Steel Shingle, Grip-Lock Roofing, Pressed Standing Seam or Roll Roofing, Ceiling, Siding, etc. Not the space of a pinpoint on steel is exposed to weather.

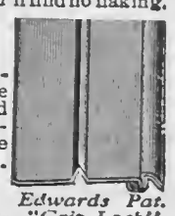
Corrugated

How to Test Galvanizing

Take any other galvanized steel, bend it back and forth several times, hammer it down each time. You will be able to flake off great scales of galvanizing with your finger nail. Apply this test to a piece of Edwards Tightcote Galvanized Steel Roofing—you'll find no flaking.

EDWARDS Patent Interlocking Device

Prevents Warping, Buckling or Breaking. Protects Nail Holes—nails are driven through under layer not exposed to weather. No special tools or experience needed to lay—anyone can do the work—lay over old shingles if you wish.



Edwards Pat. "Grip-Lock"

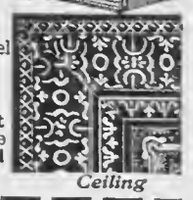
Reo Steel Shingles

Cost Less; Outwear 3 Ordinary Roofs

No matter what kind of a building you have in mind there is a style of EDWARDS Tightcote Galvanized Roofing exactly suited to your need. **Lightning-proof, Fire-proof, Rust-proof, Rot-proof. Lasts as Long as Building Stands.**

GARAGE $49.50

Lowest price ever made on Ready-Made Fire-Proof Steel Garages. Set up any place. Postal brings illustrated 64-page catalog.



Ceiling

FREIGHT PREPAID

Lowest Factory Prices. Greatest roofing proposition ever made. We sell direct to you and **save you all in-between dealers' profits.**

FREE Roofing Book

We simply ask the right to prove to you that our prices are lowest ever made for World's Best Roofing. Postal or coupon brings Free Samples, Prices and Roofing Book No. 1273.

The Rural New-Yorker

THE BUSINESS FARMER'S PAPER

A National Weekly Journal for Country and Suburban Homes

Established 1850

Published weekly by the Rural Publishing Company, 333 West 30th Street, New York
HERBERT W. COLLINGWOOD, President and Editor.
JOHN J. DILLON, Treasurer and General Manager.
WM. F. DILLON, Secretary. MRS. E. T. ROYLE, Associate Editor.

SUBSCRIPTION: ONE DOLLAR A YEAR

To foreign countries in the Universal Postal Union, $2.04, equal to 8s. 6d., or 8½ marks, or 10½ francs. Remit in money order, express order, personal check or bank draft.

Entered at New York Post Office as Second Class Matter.

Advertising rates, 75 cents per agate line—7 words. References required for advertisers unknown to us; and cash must accompany transient orders.

"A SQUARE DEAL"

We believe that every advertisement in this paper is backed by a responsible person. We use every possible precaution and admit the advertising of reliable houses only. But to make doubly sure, we will make good any loss to paid subscribers sustained by trusting any deliberate swindler, irresponsible advertisers or misleading advertisements in our columns, and any such swindler will be publicly exposed. We are also often called upon to adjust differences or mistakes between our subscribers and honest, responsible houses, whether advertisers or not. We willingly use our good offices to this end, but such cases should not be confused with dishonest transactions. We protect subscribers against rogues, but we will not be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent to us within one month of the time of the transaction, and to identify it, you should mention THE RURAL NEW-YORKER when writing the advertiser.

A WHOLE lot of gentlemen are getting ready to "save the dear old farmer" by selling him some new form of potash. Well, sir, there is just one argument worth listening to. When you get ready to offer available potash for less than five to six cents a pound come forward! Until that time comes—what's the use?

*

THIS is another warning about the so-called "Barron" strain of Leghorns and Wyandottes. Take our advice and breed these strains pure if at all. Do not cross with your American Leghorns if the latter now lay a chalk white egg, and do not buy breeding stock which represents a cross of the two strains. Evidently some of our American breeders bought a cockerel or a few eggs of this Barron stock and have made a cross with the American birds. Now they offer the results of this crossing as pure "Barron" stock, when it is nothing of the sort. Such pullets will make good layers—though the eggs will probably show more or less tint, but they are not what you want as breeders. Make the "papers" of those Barron birds fit like the paper on the wall, or do not use them for breeding!

*

WILL you state clearly the points in the following questions: What is customary for a man working a farm on thirds; the owner finding all implements and horses? Do we find one-third of anything or does he bear all expenses and pay us one-third for work? J. A.
New York.

This calls for explanation a dozen times a year. The usual plan is to divide the business into three parts, real estate, labor and personal property. If the owner furnishes the real estate and the tenant gives the labor they would each receive one-third. The remaining third would be divided in proportion as each contributed to it. If the owner provided all stock, seed, fertilizer and capital, the entire third would come to him. If the tenant provided some of the stock and paid a share of the bills he would receive a share of this third in proportion to what he paid in. This is the basis for figuring such contracts.

*

SUPPOSE all farmers by improved methods of cultivation should increase the output of their farms 25 per cent. or even 10 per cent.; the result would be disastrous in the extreme in the lowering of prices to a non-profitable point.

A writer in the New York *Sun* makes this point, which we have used repeatedly without serious contradiction:

The rest of us, not dependent upon the soil for a living, would enjoy in some degree cheaper flour, corn, cotton, butter, eggs, etc. I say in some degree, because the middleman never gives us the full benefit of the low rates at which he buys farm products, but where does the farmer come in? His efforts to increase the productive capacity of his soil, instead of bringing him reward in the shape of profits, may deprive him of any profits whatever. It is to the interest of the farmers of the country as a whole to curtail production in order to maintain high or at least relatively high prices.

Just now everyone, from the Secretary of the Treasury down to the small storekeeper at the South who "finances" a colored tenant farmer, is trying to compel planters to grow less cotton. In some States laws are contemplated which would make it a misdemeanor to plant a full acreage. Low prices for farm crops will always mean a low grade farming. The railroads are all greatly in favor of increasing the nation's crops. This means more business for them, and at the same time lower prices for farm products. Yet while advocating big crops and low prices for farmers the railroads are demanding higher freight rates for themselves! The farmer will be inclined to take "efficiency" at its college valuation when he sees the railroads, the feed men, the fertilizer men, and the manufacturer making "two blades of grass grow where one grew before." "Efficiency" for all those big interests means making a thing as cheaply as possible, and then curtailing the output so as to hold up the price.

THERE is a model flour mill located at the Kansas Agricultural College—with a capacity of 75 barrels every 24 hours. Wheat is grown on the college farm. The students and faculty have pledged a carload of wheat grown and milled at this college to be sent to relieve the suffering Belgians. The flour sacks will be stamped "Aggie's Best"—in purple and white—the college colors. A noble and characteristic charity! This bread upon the waters will return in the form of cake for Kansas. Over 30 years ago the writer lived in a Colorado town. Wheat was the staple crop, but there was such a tremendous yield that prices were at the bottom, and many a farmer stood to lose his land. A river flood did great damage to Memphis and towns below that city, and there was a call for help. Out of their poverty the farmers contributed a carload of wheat. It was ground at the local mill and sent on without thought of any return. The quality of that flour from Colorado wheat was so superior that as a result of that shipment orders for more came rushing in, and it proved the beginning of a superior and profitable trade.

*

"I'LL sell you the straw stack for $3.50." There were 2½ tons of straw in it. The buyer held off. He said: "I can get a straw stack for hauling it away, but I would rather pay something for this one than go that much further and pull over bad roads." The first farmer had a partly worn-out property, he was paying tribute to fertilizer interests to the extent of nearly $100 a year, and was forgetting a conservative estimate of the value of that 2½-ton straw stack would easily be $6.50, according to fertilizer values. Many men are selling straw from the farm at $5 a ton, hauling it to station over a half a dozen miles of bad roads, and hauling back fertilizer or trading their straw check to even up fertilizer account. The average ton of wheat straw contains 12 pounds of potash, of oat straw 25 pounds. A ton of the straw used as bedding will absorb and hold about 50 pounds more potash—most of which would otherwise be lost in the liquid. In northern New Jersey we often sell rye straw at $20 or more per ton. This may pay, but to let the straw go for less than $10 per ton is robbing the farmer to pay the taxes.

*

WE have expressed our opinion of "stone meal" on various occasions. We do not believe it is worth much more than many common soils found in the State of New Jersey. Mr. C. Schnell, of the Stonemeal Company, still takes his product seriously and he comes back in a long letter which contains the following:

We have unsolicited, un-bought-and-paid-for expert evidence that about 4 per cent. of our potash in the composition is water-soluble, and as a very considerable portion of our potash in silicate of potash, the only form congenial and assimilable to plants and the only form supplied for their use by the All-wise Creator, we are to-day the only concern in this country able to make the inexhaustible masses of potash in our feldspatic rocks available. Therefore we ought to get friendly cooperation from "farmers' friends"; yes, from every patriotic American, instead of sneering, insinuating condemnation. That, however, has always been the lot of missionaries.

The muriate, sulphate, kainit and other forms of available potash so largely used as fertilizers were also supplied by the All-wise Creator! If this "stone meal" contains four per cent. of available potash (which we doubt) that makes it worth about $4 per ton. Now when farmers are charged $30 per ton for this stuff where do they find the other $26 of value? Our agricultural chemists have worked out definite methods of estimating the value of plant food. They say this "stone meal" is worth about $4 per ton. The company selling it asks a farmer to pay $30 for it. It is up to them to explain where the $26 difference in value comes in. As for the claims that this crushed rock will prevent blight, rust or rot, we call that "guff" pure and simple—not worth considering in the light of agricultural science.

*

WHENEVER the price of wheat goes above the average the city man claims that all farmers must be getting rich. He seems to think that wheat is grown on every farm in the country so that all prosper when that grain brings one dollar or more per bushel. The fact is that high prices for wheat and flour prove a hardship to a large proportion of our farmers, because they buy most of the flour they use. In only 18 of the States is the wheat crop large enough to give a surplus above the local requirements, while in 30 States wheat and flour must be brought in from other sections. In the nine States comprising New England, New York, New Jersey and Pennsylvania, there is a yearly deficit of 115,800,000 bushels of wheat below the crop produced in this territory. Years ago New York produced wheat enough to provide flour for her entire population and then had a large supply for export. Now the State requires 45,000,000 bushels each year in addition to what her own soil produces. Of all the Atlantic coast States, from Maine to Florida, only two—Delaware and Maryland—produce a small surplus of wheat. Even Ohio falls short over 6,000,000 bushels. Indiana is the only State left east of the Mississippi that produces any large surplus of wheat. The Northwest has now become the great granary of the continent. Wisconsin, once a great wheat producer, now runs 9,000,000 bushels behind. It is no reflection upon the Eastern farmers that they have given up growing wheat. It is an indication of good management, since they have taken up dairying, fruit growing or the production of more profitable crops. California was once noted as a wheat producing State, but now fruits and nuts pay so much better that 8,000,000 bushels must be brought from other States to meet home requirements. Our opinion is that with higher prices more wheat will be grown in the Eastern States. At present, however, an increased price for wheat and flour means that the Eastern farmer must pay more for his bread and also for his feed, since all feeds rise in price when wheat and corn are high. The average city man cannot grasp the idea that Eastern farming is coming to be a business of specialties. Whereas years ago each farm produced its own bread and meat and a large share of needed fibre now many of them produce some specialty like milk or fruit or vegetables, and with the money thus obtained buy what other farmers also produce as specialties.

*

THERE are all sorts of middlemen. Some farmers sell their produce to commission merchants, other sell them to animals—cows, steers, sheep, hogs or poultry. This thing of selling produce to animals is not well understood—but it is just what a dairy, hog or poultry farmer does. The cow, hog or hen accepts the hay, grain or fodder, and turns it into a cash product. When the commission man gives us a 35-cent dollar we have a name for him, and the other string of handlers which would not look nice in print. What about the friend on four legs or the friend in feathers who gives us a 35-cent dollar? We have this friend under control, while the human middleman is out of our reach. Consider the year's record of those Hope Farm "hens." During the year one of them laid 79 eggs, while another laid 190. It is safe to assume that the poor bird ate as much as the other. From her appearance we should judge she ate more! Yet, in returns compared with the good one this hen gave but a 40-cent dollar. It was really less than that, for the poor bird did her laying when eggs were cheapest. With a flock of that poor character a farmer would lose money on every bushel of grain he fed, while there would be a good profit in selling to the other bird. This difference will run through all kinds of live stock. The Department of Agriculture finds this true in figuring the income and capital of general farming:

Investigations relating to profits in farming show conclusively that the efficiency of the animals to which the crops are fed is one of the most important factors in determining the farmer's net income. This is to be expected, since on many farms in this country the bulk of the crops is in reality sold to the dairy herd or to meat producing animals. If these are of such poor quality that they yield low returns for their feed the income to the farmer must be correspondingly small. Hence, no matter how large the total investment, if the quality of the equipment is deficient financial failure is inevitable.

There is no question about that. A scrub may prove a good individual producer. The chances are 10 to one against her, because no effort has been made to take the failures out of her pedigree. There are 10 chances to one in favor of the purebred because every effort has been made to keep these failures out.

BREVITIES.

FROZEN roots—poor food.

"Back-to-the-landing" seems to be expanding.

UNDER Mendel's law which would carry the dominant principle—a scrub man or a purebred cow?

A FARMER says this new motto, "An apple a day keeps the doctor away" is not correct. The local doctor stops for an apple every time he drives near.

THE time difference between Paris and Washington has been settled as five hours 17 minutes and a fraction over 36½ seconds. In miles the distance is 3,831.

WE have several readers who ask us to tell all about whitewashing with a pump. How make the whitewash and how put it on? What nozzle? How much power?

PARTIES come and parties go—politics work to and fro, but you cannot legislate man into a moral State. He must work it out himself or be left upon the shelf.

THE things of life which all men prize, come unto those who advertise, who come right out where all may see with character and pedigree stamped on the package full and fair. They get the trade and some to spare.

THE war is upsetting all forms of industry in Europe. Formerly wood was used for mine props in English coal pits. Germany declared such wood contraband of war. Now steel tubes from old boilers covered with concrete are being substituted.

NATIONAL GRANGE MEETING.

PART II.

THE closing days of the annual session of the National Grange were occupied with its most important business. Considerable time was given to the discussion of co-operation in buying and selling and the subject was viewed from many and various angles. By common consent certain fundamental principles necessary to successful co-operation were adduced which may be stated as follows: Co-operation should begin with the smaller unit, as, for instance, the subordinate Grange, and work upward to county, State and national co-operation. Confidence must be established in the organization and its management. In co-operative societies each stockholder should have one vote, and not a vote for each share of stock. High-grade products only should be handled and these put upon the market in first-class order; honest packing and grading (as in fruit), absolutely essential. Co-operative organizations should be operated on a cash basis, credit ventures are uncertain. Adequate financial arrangements are absolutely essential. These general principles were incorporated in the report of the committee on co-operation who also recommended the larger use of the parcel post as a means of saving the cost of transportation and the middleman's expenses to a large degree as between producer and consumer. The committee also favored the appointment of a national market commission by the President.

As to ship subsidies and our merchant marine the Grange went on record to the effect that if government funds were to be used to aid in building up an American marine it should be for ships owned and operated by the government and it opposed the expenditure of the peoples' moneys for building of ships to be operated by any corporation for profit. On the general principle that no government franchises shall be granted that are for the enrichment of the few at the expense of all, the Grange is a unit. This applies as well to the conservation of our natural resources. It also emphatically asserts its purpose to support a conservation policy that shall keep and develop for the benefit of all the people all the natural resources not yet surrendered to private ownership and the latter shall be taxed at a fair rate on their full franchise valuation.

Good roads, especially good market roads, are demanded by the Grange for the farmers' benefit primarily. The good roads policy of the National Grange has not been concisely defined heretofore, so it was deemed advisable to formulate what may be styled the National Grange good roads policy, and to that end a committee was appointed which reported later to the session what it also later adopted as the Grange pronunciamento on the subject. It sets forth that the National Grange is the pioneer in national aid for good roads; that the roads needed first are those which put the farmer in close touch with the trading centres: that while scenic roads are desirable, when they can be afforded, market roads are indispensable and that the construction, maintenance and control of these roads shall be kept within the smallest possible unit of population or area consistent with the highest efficiency of administration. The Grange goes on record against "the many bonding schemes advanced by those seeking touring roads, believing the pay-as-you-go policy to be far more business-like." As roads are local affairs their control should remain with the people in whose midst they are located. The Grange directs attention to the grave dangers existing in bureaucratic control and to the fact that much of the good roads sentiment "comes from those who are more anxious to build roads for bonds than sell bonds for roads." The legislative committees of the Grange, both national and State, are urged to use their utmost efforts to secure, first, business roads that will serve the best interests of both producer and consumer.

On schools and education there were some important recommendations. It was held that the boys and girls of the country should be enabled to secure at least a high school education without necessarily leaving their home communities to get it. The unit of administration of our schools should be large enough for the highest efficiency but small enough to secure the largest possible interest and co-operation of the people most directly concerned. Legislation to change the units of administration should be optional rather than mandatory. Courses of study should be such as to combine culture with efficiency and send out graduates "equipped to live a life as well as to make a living." The possibilities offered the Grange and the schools through the provisions of the Smith-Lever law, were called to the attention of the Grange public. The advantages will be enormous, and the extension work in agriculture will be possible to an extent undreamed of before.

The Grange opposed the proposition to let the contracts for carrying the mails on rural roads to the highest bidder. It favored the removal of all limitations from the amounts that may be deposited in postal savings banks and the use of savings funds to make loans to farmers; it recommended uniformity of laws as to methods of assessment of taxes and valuation; it protested against the seating of United States Senators, whose election can be shown to have resulted from the corrupt use of funds or methods of coercion. It approved the proposition to celebrate the fiftieth anniversary of the organization of the Grange at the annual session of 1916. It voted to secure a codification of the tax laws of all the States for use in the Granges for better enlightenment on the subject of taxation. It opposes an amendment to the Federal Constitution giving suffrage to women, and declared it a State matter, although expressing its support of the principle of equal suffrage. It demanded more restrictive laws in regard to immigrants and advocated some rigid educational test; it declared that no farm credit law would be satisfactory to the Grange, nor meet the fullest needs of agriculture, which places in the hands of private capital the power to make interest rates on mortgage bonds without limitations by Federal law; it opposed proportional representation in the National Grange, and it voted to hold the next annual session in California. J. W. D.

New York State Agricultural Society.

THE seventy-fifth annual convention of the New York State Agricultural Society will be held in the assembly parlors of the Capitol in Albany on Wednesday and Thursday, January 20th and 21st. An evening session will be held in the Assembly Chamber on Wednesday evening, and a banquet in one of the hotels is planned as a fitting close of the convention. The banquet will probably be a dollar a plate, and promises to be the largest banquet ever held in the city of Albany. This will be a new departure for the Society, and promises to be very popular. The speeches at the banquet will be brief but numerous, and will cover a wide field of subjects, by both men and women of national reputation.

Another new feature of this convention will be attendance of women. Last year the association broke away from its previous custom and elected a woman, Mrs. Julian Heath, President of the National Housewives' League, as the first vice-president. Mrs. Heath promises the attendance of a large number of her League, and all the women of the State are cordially invited to be present. The farm women are especially invited, and arrangements are being perfected for their entertainment, and committees will be in waiting to see that their comforts are looked after while in the Capitol City. The program for the convention is nearly completed, and men of State and National reputation have accepted invitations to discuss the achievements and needs of the farming interests of the Empire State.

This being the seventy-fifth anniversary of the Association, all the living ex-presidents are expected to be present, and many of them have already promised to come. This convention has got to be one of the features of the calendar for the farmers of the State, and it is intended to make the seventy-fifth anniversary the largest and best in the history of the Society.

New York State News.

PLANNING FOR NEW STATE FAIR.—It is said that there are three plans, at least, for the reorganization of the State Fair management. One idea is to make the Fair a bureau of the State Agricultural Department, the Commissioner to appoint a superintendent of the Fair who shall be responsible to him alone. Another plan is to have a large commission with the Lieutenant-Governor at its head, with representatives from the various agricultural, horticultural, cattle, dairy, sheep, and other societies of the State. These commissioners would draw no salary and the management would be in the hands of a superintendent appointed by the commission. The other plan is to have a commission of three, the Lieutenant-Governor, the Commissioner of Agriculture and a Fair superintendent, the latter to be in constant charge of affairs, and who would be paid a good salary. Legislation on the subject may be expected early in January.

STATE FORESTS AND THE CONSTITUTION.—One of the matters that will be brought to the attention of the constitutional convention next year will be the elimination therefrom of the section which prohibits the removal of any timber from the forest preserve and declares that the preserve shall be forever kept as wild forest lands. Most of the forestry organizations and the State Forestry College are said to be behind the movement. It is estimated that the State is losing a million dollars a year by not using the forest lands "in a reasonable way." The State is expending approximately $85,000 a year in the protection of these forests.

THE EDUCATION CONVENTION.—Addressing the State Teachers' Association Dr. Thomas E. Finnegan, Assistant Commissioner of Education, arraigned the present system governing rural schools and declared in favor of the township unit system, making the town the unit for the administration for school affairs in rural districts. His plan also includes a system of specific instruction for rural school teachers. Dr. A. C. Thompson, principal of the State Normal and Training School, at Brockport, argued for the home-farm school, as he styled it. He would have a rural community buy a good farm centrally located, wherein a school should be established as a community centre, with teachers and others employed of sufficient number to teach the school and do the work of the farm, making it a sort of experiment station for the community's benefit. It could also be made a trade school where the trades that contribute to the needs of the farm could be taught. He believes that such a community school could be made to pay a financial profit. J. W. D.

The Foot-and-Mouth Disease.

THE latest news of the outbreak of foot and mouth disease is encouraging. The Department of Agriculture has raised the quarantine against Canada. They think the quarantine now established is sufficient to stop the movement of infected cattle and the disease can now be held. In New York State the situation is declared to be well in hand. The heaviest single loss was a dairy herd of 289 cattle on Long Island. This entire herd was slaughtered and was appraised at the valuation of $22,500. The disease was found at the Buffalo Stock Yards, which have now been cleaned. Otherwise this disease has been confined to only one or two sections of the State. In view of this the live-stock breeders and owners, in sections of the State where the disease has never been found, ought to be permitted to ship out their stock under fair regulations. The spread of the disease seems to have been checked. It will now be distinctly located in a number of small sections and stamped out. This policy, properly carried out, ought to permit the shipment of stock from districts where the disease was never found. The Department of Agriculture also refers to a rumor which has been circulated in some of the daily papers. These reports were that certain men are at work intentionally spreading the disease, in the hope of interfering with the export of meat for war purposes. Tracing this story down, it came to be a man in Nebraska who claimed to have heard conversations between two men who were equipped with syringes for injecting the germs of the disease. The investigation proved that this report was nothing more than a drunken dream, and this appears to be the foundation of sensational reports given in some of the daily papers. It is a foolish and wicked thing to spread these reports. The disease will now be quickly and promptly eradicated, and the general public has nothing to fear from the disease. It has caused trouble enough to our live-stock breeders, and it should now be promptly and quietly closed up.

The Commission Man's Side.

AT a recent meeting of the Medway Farmers' Club the topic of the evening was: "Is the commission man necessary to the farmer?" and a well-known Boston commission man gave a general talk on the subject, or rather gave an example of some of the problems he meets every day. Most of what he said was good sound sense, true to conditions as they now exist, as the writer well knows, having followed the market in selling farm produce for a number of years. A few of the incidents he related are useful and every-day experiences, some of which we might profit by. A strong point he made, and on which I agree having been caught that way many times myself, is not to try to force too high a price from a buyer, but be satisfied with a reasonable one This should give you fair returns and at the same time does not force up the retail price so as to cut sales and limit the demand at that end as an every-day customer who buys a certain amount regularly at a fair price is much to be preferred to one who comes only occasionally. The latter might pay more for what he bought, yet he would not be near as good a customer as the regular daily buyer at a less price, because what he does not take many times has to be sold for what you can get. This to a chance customer is usually much less than sales to regular customer, and makes the average shrink quite a good deal. Another good point; it pays always to let the commission man know a day or two ahead if possible what you are going to ship him, and also if you are going to have a large increase above what you have been shipping be sure to let him know beforehand, and he can many times place it to better advantage than if he knew nothing about it, until it arrived. This perhaps might be after its best buyers of the day had purchased their supply, in which case it would have to be sold to a chance customer at what he was willing to give, or carried over to the next day. In the latter case two days stock must be sold in one day, which would not naturally help prices or sales, especially when much stuff was coming in every day. At such times the buyer is far more particular to get strictly fresh stuff than when it is not plenty. One or two-days-old stuff is not fresh, and is hard to sell at a low price, and, of course, means very poor or no returns at all to the producer who sent it in.

In another case a commission man had been handling a man's raspberries and making good returns for them. Two of his neighbors, hearing of this, and not being satisfied with what had been returned for theirs by their commission man, sent their pick to the commission man who had made the good returns. The result was all these lots coming when only one was expected, they could not be disposed of to advantage, and a loss all round was the result. The shippers lost by charging more than the difference they expected to gain, and the commission man lost the two new customers and the old one also.

A commission man in Boston was receiving apples which while good in quality were not graded or sorted, but put up, all sizes, in bushel packages. These sold in Boston at 40 to 65 cents per bushel. The commission man took a trip out to this orchard one day and the owner asked about the market conditions, and stated he did not know how to pack his apples properly. He asked the commission man's advice about packing. The commission man said: "I know how they should be graded and packed, but do not know how to do it myself." He was urged to try, however, and did so, but made a failure of the job. He then advised the orchard man to send to the college for an expert to do the packing. This was done, and the apples so packed were shipped in to the commission man. The next morning after they were received at Boston a buyer who had been taking the mixed packed apples at 65 cents or less, balked at paying $1 per box, which the commission man asked for the best grade of sorted apples which, however, were not the largest size apples, but were all of a size and even packed. After some talk, however, the buyer took a certain number of the sorted apples and sent them to his store. In a day or two he returned and asked if any more of those apples were left. If so he wanted all there were, and as many more as he could get. This was pretty good proof that it pays to grade and properly pack all good apples if we want good returns for them, and a steady demand, as a satisfied customer generally comes back and becomes a steady buyer.

A. E. PROCTOR.

Meeting of Co-operative Associations.

THE second conference of the Co-operative Associations of the State of New York will be held in the city of Ithaca on January 13, 14, and 15, 1915. A large attendance of association officers, managers and members is expected to be present.

Invitations have also been accepted by a large number of high-class manufacturers and wholesale dealers in farm supplies to send representatives with a view of establishing trade relations direct with the associations.

The advantages of these co-operative associations are apparent wherever they have been properly organized and managed. At first the farmers of Chautauqua County hesitated about organizing. Several meetings were held before they decided to go ahead in even a limited way, and organized the South Shore Growers' and Shippers' Association, with special reference to the selling of tomatoes. S. J. Cook was fortunately made manager. In all the association handled 1,400 carloads of tomatoes and received one remittance of $90,000. As all the tomatoes were sold through the association there was no competition of one grower with another, and prices were better maintained. Another year the growers will probably handle their grapes in the same way.

Large Exports to War Zone.

SPACE on vessels leaving New York for Europe is in great demand at present, as the railroads reaching this terminal have been crowded with all sorts of war supplies. Thousands of horses and mules are being unloaded from Pennsylvania and New York Central trains. At one time there were 75 carloads of shoes, 60 carloads of knit goods, 100 carloads of saddles and harness, thousands of tons of barbed wire, great quantities of fur coats from Minnesota, 150 cars of auto trucks, and 25 cars of "caterpillar" traction engines. Orders said to be now in the hands of various manufacturers cover a daily output of 800 tons shrapnel material, $20,000,000 worth of vehicles; shoes, $2,000,000; sword and revolver sheaths, $1,000,000, while the West is being scoured for horses suitable for heavy cavalry work. A steel concern in Eastern Pennsylvania is believed to have orders totalling $40,000,000.

WE recently printed a little "poem" on "richer milk" by the Holstein Office Boy. The poets are coming in like bees to reply. Their "poems" will be printed in the Christmas Number.

DRIED swamp muck is a good absorbent to use in the stable gutters, but it makes poor bedding for dairy cows. When they lie upon it they become soiled and dusty, and it is hard to clean them properly. It will do for steers, but not for dairy cows. It is good for the gutters or manure pile.

Woman and the Home

From Day to Day

A CHRISTMAS CAROL.

"What means this glory round our feet,"
The Magi mused, "more bright than morn?"
And voices chanted clear and sweet,
"Today the Prince of Peace is born!"

"What means that star," the shepherds said,
"That brightens through the rocky glen?"
And angels, answering overhead,
Sang, "Peace on earth, good will to men!"

'Tis eighteen hundred years and more
Since those sweet oracles were dumb;
We wait for Him, like them of yore;
Alas, He seems so slow to come!

But it was said, in words of gold
No time or sorrow ne'er shall dim,
That little children might be bold
In perfect trust to come to Him.

All round about our feet shall shine
A light like that the wise men saw,
If we our loving wills incline
To that sweet life which is the law.

So shall we learn to understand
The simple faith of shepherds then,
And, clasping kindly hand in hand,
Sing, "Peace on earth, good will to men!"

And they who do their souls no wrong,
But keep at eve the faith of morn,
Shall daily hear the angel song
"Today the Prince of Peace is born!"

—James Russell Lowell.

*

THE Department of Household Science of the University of Illinois has sent out an interesting bulletin entitled "The Planning of Meals," by Isabel Bevier. Farm housekeepers often feel that dietitians rarely consider the character and variety of food that they find most accessible, when making up their meals. This bulletin, however, includes 12 different menus, using four common articles of food, beef, cabbage, potatoes and apples in a different way each time. There are also comparisons of food values that will be very helpful.

*

PATTERNS for infants' wardrobes are always in style and though we have printed these pattern numbers several times, there are always new readers who have missed seeing them. There is an infant's wardrobe complete (no pattern number) consisting of 16 patterns, the entire outfit costing 40 cents. Another infant's set, pattern No. 7917, includes dress, petticoat, and kimono. A baby's short outfit (no pattern number) including eight patterns, costs 30 cents. Another infant's set, No. 7912, includes dress, coat and cap. In making up baby clothes, there is a sensible tendency toward plainness, fine materials and dainty stitches taking the place of lace and embroidery. Soft-finished fabrics should always be used. Hand-made robes of soft nainsook, trimmed with the finest of feather-stitchings and hand-run tucks, have permanent beauty and refinement and if the busy woman has to run her seams and hems on the machine, that is all the more reason for simple daintiness in the finishing.

The Rural Patterns.

When ordering patterns give number and size desired. Price of each pattern 10 cents.

Pattern 8472A shows a smart tailored coat with cutaway fronts, perforated for two lengths. Cut in sizes 34 to 44 bust measure. For the medium size will be needed 4½ yards 27 inches, 3⅛ yards 36 inches, 2½ yards 44 inches or 2⅛ yards 54 inches wide, with one-eighth yard 28 inches wide for the collar. This is a becoming model for plump women, far more so than a belted coat. 8326, Child's dress. Cut in sizes 2, 4, and 6 years. Size 4 requires 1½ yards of 27 or 36 inch material for body portion and 1⅝ yards for skirt; or, 1⅞ yards of 44 inch to make of one material. 8274A, Girl's dress. Cut in sizes 6, 8 and 10 years. Size 8 requires 1⅝ yards of 36 or 44 inch material for blouse and 1⅜ yards for skirt and trimming. 8345, Girl's dress. Cut in sizes 6, 8 and 10 years. Size 8 requires 2⅞ yards of 36 inch material with three-eighths yard 27 inch for collar and cuffs. 8269, Girl's guimpe dress. Cut in sizes 4, 6 and 8 years. Size 6 requires 2 yards of 27 or 36 inch material for dress with seven-eighths yard for guimpe. 8249, Child's rompers. Cut in sizes 2, 4, and 6 years. Size 4 requires 2¼ yards of 36 inch material with 1⅛ yards 27 inch for trimming.

Seen in New York Shops.

COVERT cloth suits, in sand or putty color, are among the newest fashions. Anyone who remembers the covert coats we all wore 20 years ago knows how well this fabric wears. With dark-colored furs, especially skunk or fox, these light colors are becoming, and particularly so to young women. The covert cloth is always made up very plainly, with mannish tailoring. A very smart style for young women is the "Tommy Atkins," which has a plain full gored skirt, and a belted coat with patch pockets, cut like a field uniform. The coat of another favored model has a pleated

back with deep yoke and loose belt. The skirts are quite short, which is one reason why spats, or boots with cloth tops, fawn, tan or gray, are so popular. With these light-colored suits dark hats of velvet or felt are always worn.

The present vogue for sand and putty color has brought out the same tints in chiffon blouses. While the white blouse always remains in vogue, there is a decided preference for a blouse matching the skirt. Light-weight silks and crapes are favored for plain tailored blouses, but chiffon is the greatest favorite of all. It is usually made up over white or flesh-colored lining. Some of these chiffon waists have surplice straps or yokes of taffeta, with collars of lace, batiste or white taffeta.

Separate dress skirts are to be procured in more variety than ever, for though a commonplace "shirt waist and skirt," is not stylish, there are many occasions when such a skirt is combined very conveniently with a pretty blouse. Among black broadcloth skirts noted were several with a tunic falling from a circular yoke. A dressy model had a full rippled over-drapery banded with skunk-dyed raccoon fur, with rows of tiny velvet buttons down the side. A plain but handsome broadcloth skirt was full, a flaring circular shape attached to a deep charmeuse yoke. Another circular model had a deep yoke pointed at back and front.

"Buy a bale" party cases offered among novelties were of the customary box shape covered with smooth burlap in the natural color, strapped with black, so as to suggest a miniature cotton bale. They were lined with tan-colored moiré, with the usual gilded fittings.

Sanitary woolen underwear is expensive, but a necessary thing to those in a rigorous climate, and also to invalids undergoing fresh air treatment. Prices are said to be lower than last year; separate garments are $2.50 to $4; union suits $4.50 to $6.25. Other all-wool specialties are open-air sleeping outfits, bed socks, knee-warmers and abdominal bands, Many middle-aged and elderly people do not realize how much Winter comfort would be gained by the knee-protectors, which often prevent rheumatic twinges.

All over the world thousands of women are busily knitting soldiers' comforts, and all the New York stores that sell the materials have instructors who will teach purchasers how to knit gloves, socks, mufflers, helmets and abdominal bands. This is a case where, so far, machinery has not superseded hand work. The abdominal bands (cholera bands, they are often called) are knitted into a circle, the center plain garter stitch, with each edge ridged like the top of a stocking, so that they are firm, yet elastic. Any man exposed to exhausting outdoor manual labor in cold and storm, like many farmers, would find this soldier's comfort very desirable.

Boys' mackinaw coats are very "sporty" in all sorts of plaids, both bright and dull colors, with shawl-rolled or convertible collars; they have been offered, in sizes 10 to 17 years, for $6.75.

Fashions in toys, like fashions in dress, show a tendency to return to old times. Elderly women will remember the wooden dolls of long ago, arms, legs, body and head all whittled out, their round wooden faces painted, with rosy cheeks and staring eyes. One of the newest "indestructible" dolls is all of wood, with jointed limbs, and really not very different from the old-style toy, except for its more artistic finish. There are many other new wooden toys that return to old styles, especially funny birds and animals on wheels, intended for the littlest children. Among the soft cloth birds and beasts for the babies are fat and solemn ducks, nearly life size, gaily colored; as beak, feet and all are of cloth there is nothing to hurt a tiny child. Military toys are very plentiful; in addition to the old-fashioned lead soldiers, which have changed but little since Hans Anderson wrote about them, there are modern troops in some sort of composition like papier-mache, with dirigibles and other up-to-date necessities.

The American Parlor Lamp makes your home beautiful and comfortable. Lights the entire room with a soft white light, almost as light as day. Easy on the eyes—you can read or sew by the hour and not have the least tinkling of tired eyes or headache.

The American gives a light of 400 candle power and does it for one-third of a cent an hour. Always pleasant to use—no wicks to trim or chimneys to wash—nor is there any smoke or disagreeable odors. Nickel-plated finish, plain white or fancy shades with fringe to match.

IN THE WARM HEART OF THE WEST.

PART I.

THE heart of the West had called us, and like the disciples of old, we heeded the call. It was a very new West, when we first stepped forth upon the virgin soil, the soil which had never been harrowed by the plows of Progress, nor trodden by the feet of the white man or woman. Countless buffalo bones strewed the prairies, countless "wallows" and "runs" proved that not long since the great herds of wild creatures had homesteaded the plains and called them their own. The Summer was like one great, glorious picnic, the surprises on every hand, the wonderful flower bloom, the pebbles bright as jewels in the creeks, the upturned sod, the very cream of all creation, and the sundry and divers relics of the aborigines, bits of broken pipes, arrow heads of flint, of steel, stone hammers, and in fact all the strange, wonderful things a new country offers to its devotee.

Came Winter, came the near approach of Christmas, and the sunny plains scarcely touched with snow, stretched into infinity, and the lonesome-hearted knew the broadness of the separation of their own lives from the lives of those they loved. Mrs. Lonesome slipped on her coat, tied a heavy scarf over her head and went out into the great wideness of the prairies. Her feet almost unconsciously carried her to the shack of a neighbor near by at half a mile, as close as a neighbor might be, unless the homestead shacks were built just across contiguous lines. Mrs. Lonesome finding herself at the door of Mrs. Sweet, knocked lightly and entered to the cordial voice calling from within.

"I was just thinking about you, Mrs. Lonesome, and wishing you were here," Mrs. Sweet spoke vibrantly. "Sit down close to me!"

Mrs. Lonesome obeyed, looking wonderingly at the wild array of scraps lying about the little kitchen, which was living room, dining room, general room and all combined in one the real heart of a real home.

"It smells Christmassy here," Mrs. Lonesome volunteered, sniffing the fragrance of spices.

"It is Christmassy," declared Mrs. Sweet. "I believe we are to have the very best Christmas of our whole lives!"

"You are?" wistfully, "why we aren't going to have any Christmas. I told the children a week ago that Santa Claus did not come out to the plains—the chimneys, nothing but stovepipes, are too small!"

"You didn't spoil the children's right to Christmas that way!" protested Mrs. Sweet.

"Well, what could I do? Better to be prepared than hope to the end and then have the very dismallest time—on the day itself!"

"It won't be spoiled. Come over and share our Christmas," Mrs. Sweet paused a moment. "Why couldn't we have a community Christmas? All meet together, each one contribute to the great dinner and—" Mrs. Sweet's eyes were glowing, with the love of all mankind, for unto her had the Child been born, which had saved her from herself.

"That would be great!" agreed Mrs. Lonesome, "but about the tree and the presents?"

"I'm going to have a tree!" declared Mrs. Sweet, although the idea hadn't occurred to her until that very minute. "You'll see! And presents! Look here! Here is a pair of Jim's old trousers, awfully good thick cloth but worn out for him, in spite of many mendings. I was going to cut these up into mittens, and give them around to different ones, but I believe there's enough of the better parts to make Timmy Smith a pair of new little trousers; it's time he had some, he's too big for dresses, but they just can't get him any new clothes!" Mrs. Sweet was joyful.

"I should say! And then there'll be some smaller pieces to cut into small mittens, or slippers! Why, do you know, my old grandmother makes the most delightful slippers from heavy cloth? She has a real pattern, which I will get, and she lines them and sticks pieces of cloth together with cold water flour paste, presses these with hot irons until quite dry, cuts out her sole by a pattern, stitches and stitches and stitches these, until they are very solid, and the slippers are just great for the house or bed slippers, or for the Johns and Jims and Tims to wear after the long days out of doors."

"I have a real mitten pattern," Mrs. Sweet responded and she drew forth a bit of paper, and a moment later a pair of mittens which she had finished. Every stitch she had taken seemed like an ornament to the material, and the seams of the heavy cloth had been "ball-stitched" to a firmness and flatness seen seldom save on the covering of a ball. The mittens had a flaring gauntlet cuff, which was firmly bound, and short bits of feather stitching on the mitten back gave it the look of a real boughten article.

"You did that out of old scraps?" Mrs. Lonesome spoke almost in awe.

"Yes, and thanks be, there are a good many scraps to be used too, in our family, though I do buy skimpily and cut to the extreme limit of economy."

The canvass of the neighborhood followed that same day, and the day following saw women from all points of the compass converging to the home of the Sweets; they must work while the children were in school, and before the early chore time came, and work they did. If one family needed what another had in overabundance it was supplied, and so it went; not a single soul in all that little community of homesteaders, pre-empters or tree claim holders was unthought of. Even the bachelors were remembered and brought into the warmth of the West, and the Christmas spirit hovered over all.

"The tree, the tree!" cried Mrs. Lonesome. "Where is the tree coming from?"

"It's coming," Mrs. Sweet encouraged. "I believe I will tell, it'll be just that much more joy for all of us to get it ready! We're going to make a tree!"

This bomb burst one afternoon shortly before Christmas Day. "Make a tree!" gasped the wondering women.

"Look here!" and Mrs. Sweet led the way to the barn. "Here's the tree!" and she displayed with high pride, a two by four scantling, cut to just go in the door of the shack, and to reach to its very ceiling. "We are going to put on cross pieces, and branches, and we're going to decorate it with green tissue paper—I have some left over from paper flowers I used to make back East."

"Why," cried Mrs. Lonesome, "I've thought of something. Let's take the sticks out of our window shades and use them for branches; we could build up such a tree with them! Then we could use them in our shades after it was all over again!"

"What an idea!" gloried Mrs. Sweet, and Mrs. Jamison cried. "Oh, I've some of the loveliest green cloth, I colored it from an old sheet for carpet rags, and it will help to drape curtain sticks into real life and leafiness!"

"Yes, indeed!" supplied Grandma Patterson, "and why couldn't we collect up a lot of tumbleweeds, and crystallize them with alum, or even dip them in flour? Why, they'd look like Winter, and frost and snow and Christmas!"

"Well, of all things!" came a chorus, and the Christmas tree itself held the attention of all for a few days. The Sweet home was finally given over entirely to it. The children were blindfolded, to lead them through the mystic room where the Christmas tree was growing in a way of its own. Never had a tree been so fearfully and wonderfully made, and never had one so grown out of the very hearts of its creators as did this one, save dozens of others which grew up from the seed of it, for its fame spread far and wide, and the great tide of Christmas good cheer was flooding the hearts of the plains people with the gladness love and peace and good will always bring.

ROSE SEELYE-MILLER.

Variety in Plain Living.

THE bulletin on "The Planning of Meals," by Isabel Bevier, issued by the University of Illinois, gives 12 menus, using, each time, four staple foods, beef, potatoes, cabbage and apples. These staples are cooked differently in each menu, and we think they will be found very suggestive in providing changes from "the same old thing:"

1.—Porterhouse Steak, Mashed Potato, Cabbage Salad with Nuts, Baking Powder Biscuit, Apple Pie, Coffee.

2.—Tongue, Cabbage and Potato Salad, Popovers, Apple Turnovers with Grape, Tea.

3.—Roast Ribs of Beef, Baked Potatoes, Cabbage Salad (Sour Cream Dressing), Plain Bread, Baked Apples with Cream, Coffee.

4.—Creamed Dried Beef, Stuffed Potatoes, Creamed Cabbage with Peppers, Graham Muffins, Brown Betty with Cream, Coffee.

5.—Shepherd's Pie, Creamed Cabbage, White Muffins, Apple Soufflé with Whipped Cream, Cocoa.

6.—Corned Beef, Boiled Potatoes, Boiled Cabbage, Butter Rolls, Apple Pudding, Coffee.

7.—Short Ribs, French Fried Potatoes, Steamed Cabbage, Apple Dumplings and Cream, Graham Gems, Coffee.

8.—Rolled Stuffed Steak, Browned Potatoes, Hot Slaw, Baked Apples, Cream, Jelly, Nuts, Coffee.

9.—Hamburg Steak, Riced Potatoes, Escalloped Cabbage, Graham Bread, Apple Tapioca, Coffee.

10.—Corned Beef Hash, Potatoes with Butter and Parsley, Cabbage au Gratin, Entire Wheat Muffins, Dutch Apple Cake, Lemon Sauce, Tea.

11.—Beef Loaf, Creamed Potatoes, Cold Slaw, Nut Bread, Dutch Apple Cake with Cream, Coffee.

12.—Pan Broiled Flank Steak, Escalloped Potatoes, Fried Cabbage, French Rolls, Apple Short Cake and Cream, Cocoa.

ANOTHER CONNECTICUT ELECTION CAKE.—At night take three cups of milk, two of sugar, one of yeast, eight cups of flour, patent. In the morning, if light, add 2½ cups sugar, two of shortening, two eggs, two nutmegs, or a little cinnamon in place of part the nutmeg, a little soda. Work together, add raisins. Put in tins till light. This makes five loaves. MRS. W. L. D.

POTATO PIE.—Peel and boil enough potatoes for one meal, until tender, drain and mash until smooth, add salt and pepper, butter the size of egg or more if you like, add cream or rich milk until quite thin, or too thin for table use; last but not least two onions cut fine and mixed through the potatoes. Make a rich biscuit dough, roll thin, place a crust in bottom of baking pan, pour the mashed potatoes in crust and place crust over top. Prick with a fork and bake in hot oven. MRS. MAJOR.

"I RECKON," said Farmer Corntossel, "as how mebbe barbed wire ought to be counted as one of the most useful inventions of the age." "For what reason?" "When there's a lot o' work to be done, barbed wire makes it impossible to look on."—Washington Star.

Live Stock and Dairy

DAIRYING IN PENNSYLVANIA.

"MOST people think of Pennsylvania as a State whose products are mostly coal and iron," says Mr. Thompson of the Pennsylvania State Extension work," and would be surprised to know that her combined agricultural and dairy products are worth more each year than her total wealth in iron or coal. This State is not generally spoken of as the dairy State, but May Rilma, the queen of the dairy world, was born and raised in Pennsylvania. Among other records held, we find the champion aged Ayrshire cow, the champion two-year-old Ayrshire cow, the champion three-year-old and two-year-old Jersey, aged Brown Swiss and Shorthorn records are also held in the State.

"The first of July, 1914, there were seven cow-testing associations in operation, the first of November there are 13, and to show farmers are interested in the cow-testing work, one illustration suffices: Two cow-testing associations in Bradford County, each split in half, forming two more associations, and further came a fifth separate association formed in that county. There are about five other associations very nearly ready to organize. Among the early associations to be organized were the Chester Valley Co-öperative Farms Association, including some of that county's best herds, another, the Brandywine Association, was formed in Southern Chester County. These were organized about four years ago. It has only been since the county agent movement testing in the Keystone State that new life has been given to the movement. This credit reflects directly upon the county agents, for they have been the most important factor in stimulating interest in cow-testing work.

"The working plan of the association follows: We demand a man with practical dairy training who has attended Winter short or long course at the agricultural college. He visits the farmer one day each month, ariving there in time in the evening, to weigh the milk, taking a sample from each cow, also weighing grain and roughage. During the evening he generally talks dairying with the farmer. In the morning he again weighs milk, grain and roughage, samples the milk, which is tested for butter fat. He then proceeds to figure the amount of butter fat produced per day, which is multiplied by the days in that month giving the total of butter fat produced or milk sold in that month. He also computes at current prices the roughage and grain consumed for the same length of time. This is all noted in the cow-testing association record book, one copy of which is left with the farmer, and the tester keeping the other copy. At the end of the year he sums up the amount of milk produced, total pounds of butter fat and feed production cost. These figures show him whether his cow is profitable or boarder."

CHAMPION AYRSHIRE COW KILNFORD BELLE 3rd.

DAIRYING IN RHODE ISLAND.

YESTERDAY a neighbor sold his herd of Holstein cows at auction, 27 fair-sized cows in all periods of lactation. The average price was $80; the highest cow sold for $145, and the lowest $40. This particular farmer was getting 5½ cents a quart for his milk at the door, but wanted six cents, not being able to receive his price he sold out.

At the regular Fall meeting of the Milk Producers' Association of Rhode Island the price of milk was fixed at six cents a quart at the door. I am unable to tell at present if the members of the Association have been able to get what they wanted. At present there is a great scarcity of milk on the Providence market, due in part to the strike of the milk producers of Connecticut, refusing to send milk at the old price, and also to the extremely dry weather barring the pastures and forcing the farmers to feed inside about one month sooner than usual. However, in our vicinity, I believe the number of cows will not decrease, as most of the farmers are peddling their own milk and must keep up their trade. The hay crop and corn crop were both good, and with many new silos put up last Summer there is plenty of feed. The price of grains remains about the same.

Our local market for cows is Brighton. Cows bought there are loaded in the afternoon of the same day and arrive in Providence or Pawtucket at 8 a. m. the next day. Freight is $1.50 per cow, or $15 for a car. Prices for good milkers range from $90 to $100 and over; at best it is a lottery, as the cows are bagged up for all they can stand, and it is almost impossible sometimes to detect any defect in the udder. For instance a dealer bought a nice young Guernsey cow second calf, for $95, and sold her to the Jew three weeks after for $35. Another bought a splendidly marked Jersey cow (oldish) for $80;—she gave a fine lot of milk for a few days and a month after had to let her go for $35. I could multiply the examples. Some farmers have started to raise calves, and this will likely help to solve the question of better cows, but instead of investing in a good bull and raising calves from their best cows, they buy calves from the large dairies, simply trusting the owner to sell them a good calf. This is of course wrong. At the Fairoaks Farm we had to give up our cream trade for a while, being so very short of milk. We sell pan-raised cream and get 80 cents a quart for it, and we have never been able to supply the demand. For the milk so skimmed we get three cents and will charge four from November first.

Rhode Island. A. PERREGAUX.

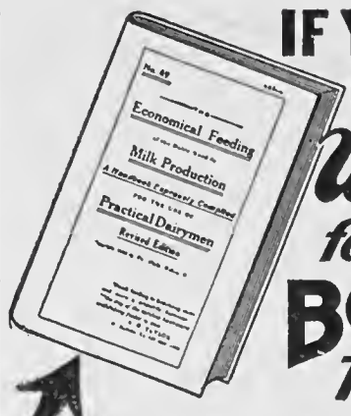
Treatment for Foot-and-mouth Disease.

PEOPLE everywhere are rushing in to tell the authorities what to do in the present outbreak. In the New York Times "A Chemist" suggests bicarbonate of soda:

"In this disease lime water, chalk, bicarbonate of potassa or bicarbonate of soda assists nature in recovering the normal condition. The 'foot-and-mouth disease' being a disease which requires a treatment externally and on a large scale, it is imperative that a remedial agent should be so mild in general action as will allow of the animal being treated very freely with it and that this substance should be practically innocuous if ingested, also that it should be so cheap that it could be used very freely. I, therefore, recommend that 'bicarbonate of soda' be used as a wash for all parts of the affected animals; as a preventive wash for all animals subject to infection; as a wash for all premises, quarters and food vessels in the case in hand; as a preventive on all runways, bridges and roads where infection could be spread; for the hands, clothing, boots, etc., of all attendants. This substance can be mixed with water to a thin cream and sprayed or for treating cattle feet for prevention of contagion they can be walked into a trough of it."

Surely no one would attempt to handle a case of foot-and-mouth disease without the best scientific help he could obtain. We submitted the above to Dr. Alexander, who says:

"Bicarbonate of soda is a fine wash for the mouth, but not at all suitable as a disinfectant. One has to use a five per cent. solution of carbolic acid or formaldehyde. I take no stock in this alkalinity theory. We prefer for the mouth a solution of borax or alum—both simple, safe and satisfactory."



IF YOU OWN COWS Write for this BOOK To-day!
Fifty-eight pages of invaluable information for the feeder of dairy cattle, based on conclusions reached by government agricultural stations and colleges. Tells
HOW TO GET THE MOST MILK AT THE LEAST COST
by the proper use of the feed stuffs you raise. Explains the daily requirements of the dairy cow. Defines Ready Rations, Balanced Rations; Nutritive Rations, Concentrates, etc. Endorsed by leading dairy farmers. Edition limited. Sent free to dairy farmers for two-cent postage. Write NOW.

CORN AND LINSEED FOR HOGS.

IN what proportions should corn and linseed meal be given to hogs, and how many pounds of the combination should be fed per hundred weight of stock that is, to produce the most economical grain? With corn at a dollar a bushel and linseed meal at $40 the ton, and hogs nine cents a pound live weight—the prices prevailing here—what profit might reasonably be expected on an eight-months hog if fed corn and linseed meal according to your reply to my first question? The above applies to dry-lot feeding only, and I name linseed meal because in many experiments it has been found to be the best and cheapest supplementary feed. Replies to the same questions about all the supplementary feeds, including the different kinds of pasturage—if reliable and not theoretical—would be very valuable in a hog book; and it is this kind of a book I should like to find. What is the status at present of inoculation for hog cholera? Also, is there a practicable hog and pig-tight movable fence? E. P. L.

If E. P. L. decides to use ear corn supplemented with linseed meal for swine, the proportion should be 15% of linseed meal on the basis of 100 pounds of corn. The amount to feed would vary materially with the age and purpose of the animal. Cornmeal and oil meal does not make a good combination for growing pigs, a better mixture would be: 100 pounds red dog flour, 100 pounds ground oats, 25 pounds bran, 10 pounds tankage. However, if the inquirer wishes to feed corn and linseed meal, animals under 100 pounds in weight, pastured on forage crops such as Alfalfa, rape or clover, should receive a pound of this mixture for each 100 pounds of live weight. Animals weighing more than 100 pounds should be given all that they will eat and clean up with relish. Digester tankage is a more economical source of protein than oil meal, and is not as laxative.

With corn at a dollar a bushel and linseed meal at $40 a ton, and hogs selling at nine cents a pound, it would be reasonable to expect a profit of $10 on an animal eight months old and weighing 300 pounds. The cost of grains would be substantially reduced in case the animals were pastured on forage crops. Perhaps the one crop that every hog man should grow for forage purposes is Dwarf Essex rape. It supplies protein in an economical and palatable form; the cost of seeding is very small and the plants are vigorous.

There are at least three books that have been published relating to swine production and are listed as follows: "Productive Swine Husbandry," by Prof. Day; "The Book of Swine," by Wm. Dietrich; "The Hog Book," by Dawson.

The use of hog cholera serum is far beyond the experimental stage. It is useful as a preventive and provides insurance at reasonable cost. It is not recommended that the serum be used, unless there is an outbreak of hog cholera in the community. A strict quarantine should be maintained in case cholera prevails. It is possible to check its spread by means of utilizing serum promptly. The double treatment, that is the use of serum and virus simultaneously, establishes permanent immunity in cases where reactions are obtained, but it has been found in some cases that the use of virus has been responsible for the introduction of the disease in the herd in case it is used with serum that does not protect. For this reason the use of virus should be limited to the use of the veterinarian, and it must be definitely known that the serum used is potent, and that it will actually protect. The double treatment is used to the best advantage and with the best results with animals that are given free range and are in a natural, healthy and vigorous condition. It is also suggested by some authorities that there is additional danger from the use of the double treatment during hot weather. It can be used to the best advantage on pigs weighing from 40 to 60 pounds.

I do not know of any practical movable fence for swine. In the West a great many swine growers take the 24-inch field fence, run it across the corn field, fastening the wire to the stalks. This is moved from time to time as the pigs clean up the area that they are hogging down. The expense of constructing a permanent fence for swine is not very great, and the use of the 24-inch field fence with a barb wire at the bottom has given very excellent results. F. C. M.

DAIRY NOTES AND PRICES.

AS to the future prospects of dairying in this country I believe they are good for any energetic young man who understands dairying. I believe that Delaware County, N. Y., will remain in the dairy business, as the land is rough and better adapted to dairying than anything else. I think the milch cow is as profitable as any line of dairying here, although some are doing well raising purebred stock. H. A. A.

Bovina Center N. Y.

FARMERS are fairly well supplied with hay, but nearly all grain is purchased, which is not higher than for the past few years. There is some tendency to increase rather than lessen the number of cows kept, and good cows are selling around $80. These for the most part are brought in by dealers. Several farmers are selling to Sheffield Farms-Slawson-Decker Co., and hiring the milk drawn about five miles; their price being considered more satisfactory for the Winter than butter prices at the local creamery.

Gilboa, N. Y. D. W. S.

The price paid here for milk at wholesale is generally 18 cents per gallon for use in Painesville and for shipment to Cleveland, out of which 1½c. per gallon must be paid for transportation to Cleveland. I feel safe in saying that the number of cows that will be carried through the Winter will be practically the same as for some time past. There are few cows for sale, in fact practically none except poor cows or old ones that have to go for butchering. There is ample feed stored for Winter generally. So far as we are personally concerned we have just quit the cow business. We do not see enough profit in it to justify the work and attention required. The price of milk is too low. The retail price of milk on the other hand is high enough (seemingly to us). If I am not mistaken milk retails in Cleveland at 36 cents, more than double what the farmer nets. H. L. M.

Painesville, O.

Oct. 26. We are receiving 5 cents per hundred pounds of milk more than the best cheese factory in this locality. We are selling to creamery at Dayton and buying back skim-milk at 12½ cents per hundred. May, 1914, $1.18 per hundred; June, 1914, $1.18-1.33 per hundred; July, 1914, $1.24-1.34 per hundred; August, 1914, $1.28-1.35 per hundred; September, 1914, $1.38-1.44 per hundred; October, 1914, $1.46-1.54 per hundred. Most of the farms in Cattaraugus County have more or less rough land; very few are level. Some can all be tilled, others are rough. Level land in the valleys is often wet a good part of the year. Our best farms are rolling, gravel soil; valleys are subject to early frosts, also highest farms.

Dayton, N. Y. F. E. H.

This would hardly be considered a dairy section yet there is some milk produced for local villages and the city of Rochester. I think there is a tendency to reduce the number of dairy cows owing to the low price paid for the milk, the increased value of the cow for beef and the shortage of fodder with high cost of milk-producing grains. We have had a dry Summer for pastures. Farmers have been obliged to feed the cows some fodder the past two months which will materially reduce the fodder supply for Winter feeding. Local villages want milk delivered at 3½ cents a quart. Some shippers get four cents net by sending to Rochester. Cows sell for $60 to $110 apiece. J. E. B.

Brockport N. Y.

F. P. SAUNDERS & SON, Cortland, N. Y.

Office, 50 Clinton Ave.

Purebred Registered

HOLSTEIN CATTLE

Near Big Bay, Mich., is a herd of thirteen purebred Holsteins. Last year the average yield per cow of this herd was 18,812 pounds of milk, and 638.57 of fat, or 3.39 per cent.

Do you realize the money there is in such cows? The average milk yield of all cows in this country is under 4,000 pounds. These thirteen cows produce as much milk as sixty-two cows of the 4,000-pounds class. It would require twenty-eight cows giving 8,500 pounds to equal their output.

Why feed, milk, and shelter scrubs?

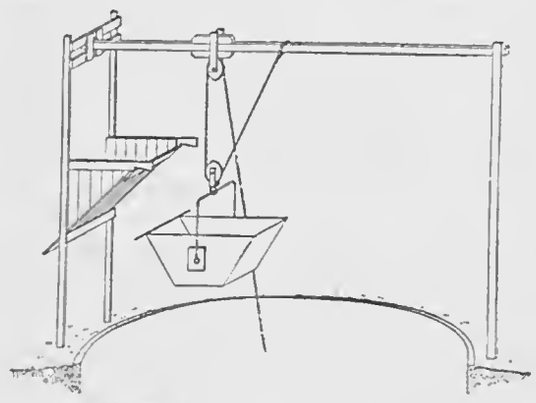
NOTES ABOUT SILAGE.

Easy Methods of Handling Silage.

THE Nebraska Experiment Station advises several conveniences in handling feed from upright, pit and partial pit silos. A handy and easily constructed convenience is the silage cart. Any farmer with saw, hammer, nails and lumber can construct one of these carts. The wheels used may be plow wheels or other small wheels. In constructing the cart the capacity should be considered. It should be borne in mind that loose silage weighs about 18½ pounds the cubic foot.

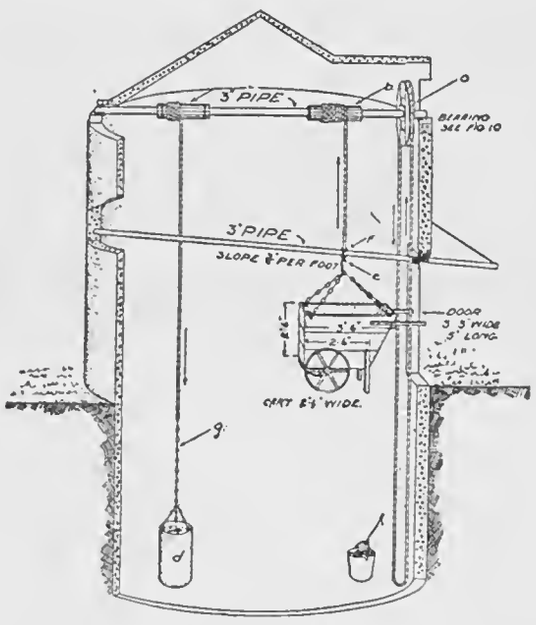
When considerable outside feeding is done a swing track is oftentimes used in the West. This makes it possible to distribute feed in a radius of consider-



HOMEMADE SILAGE LIFT.

able circle. Some farmers use a stationery track. Where twin silos are used, and it is necessary to carry feed to any distance, a U-shaped chute inclining downward toward the wagon and occupying the space between the silos is used. The sides of this chute are angular like a V, but there is a flat bottom.

Perhaps the simpler and more efficient equipment is the commercial hoist. This is built on the plan of the feed or litter carrier with track. It trips, allowing the carrier to descend into the silo. It is drawn up to the track, and slides out



HOISTING CART FROM PIT.

on the carrier to a dumping point. The simplest homemade hand hoist for pit and semi-pit silos is shown in accompanying figure, which is self-explanatory. The rod on the front end of the box catches the handles of the chute; and the pull on the rope, pulls the chute upward and catches the handles, and over it turns the box.

Selling Small Lots of Silage.

IS it possible to keep silage in small quantities, if you have no silo, but a room where you can keep a week's supply? I have four cows; my neighbor has offered to sell me silage during the Winter, as his silo is too large for his small herd. I wish to draw a week's supply at a time if that is possible. I could make a large bin to hold enough so that it would be away from the air. Would that be possible? How much silage is allowed to a cow each day? I have no idea how much I would have to allow for a week for four cows. L. E. P.
Sharon, Conn.

We have a number of reports from people who are buying or selling small quantities of silage. This seems to be a profitable business in some sections. In several cases dairymen sell the silage in this way, to people who keep family cows, or to those who have but a small herd of cattle. The best plan appears to be selling in bags. Grain or clean fertilizer sacks are used, and the silage is dug up and shoveled into these sacks much the same as grain. In this way the silage is easier to handle, keeps better in storage, and is easier to feed out. It keeps in good condition during the cool weather in any cool, airy place, such as would be suitable for roots. The price of such silage is usually figured at about one-third the selling price of high quality hay, and a supply for a week or ten days can usually be kept without trouble in cool weather. A cow of average size will eat from 30 to 40 pounds a day, depending upon her weight, and the amount of milk she is giving. This business of selling silage in small quantities is really a good proposition in many localities where there are a good many family cows, or small dairymen.

Price of Silage.

WHAT is the price of corn silage per ton? B. F. S.
Steuben Co., N. Y.

It seems to be necessary to say over and over that the local price of silage is always comparative. It is worth about 30 per cent. of the price of hay. As this price varies of course the silage will be worth more in one place and less in another. Usually if hay in the mow is worth $12 per ton, silage in the silo would be worth $3.60, or 30 per cent. of the selling price, whatever that is.

Silo Suggestions.

I HAVE had a good deal of experience in filling silos, and have perhaps learned some things that may benefit some of your readers. What I wish to say will pertain to the work inside the silo more than to the field or the machinery.

Be sure that the silo is as near airtight as possible; wooden silos frequently have small openings near the foundation which can be closed with mortar made of clay. To avoid all "air pockets" in the silage careful packing is necessary; be sure to tramp well next to the wall. If you put boys in the silo there is likely to be more play than work. An active 16-year-old boy can manage the distributing pipe all right, but two steady men should do the tramping. The silage will be sure to settle a good deal even with the best of packing, and when the silo is two-thirds full if you can let it settle a day or two you will get more in than if filled in one day. W.
Indiana.

Corn Fodder in Silo.

I SAW an article in THE R. N.-Y. regarding husked corn fodder in the silo. I put seven acres of this on top to fill up three years ago; fodder was cut 1½ inches long with husker. This was wetted from top after each load. Water was hoisted in cans and thrown on with pail. We did not lose this stuff, neither was it good feed. I consider that water in fans is only way to distribute and do a job worth while. Let us remember that to cheat the cow is a bull-head trick. Give her good corn silage, Alfalfa hay and her portion of clean grain, and she will do the rest with good treatment.
Victor, N. Y. J. N. Y.

AILING ANIMALS.

Worms.

I HAVE a nice colt which has worms. Could you tell me what to do for him?
New Jersey. H. S.

Feed the colt generously on crushed oats, wheat bran, cut Alfalfa hay or mixed clover hay. For worms give one heaping teaspoonful of a mixture of equal parts of salt, sulphur and dried sulphate of iron night and morning in the feed for one week; then skip 10 days and repeat. The worms will be killed in the intestines, so that they should not be looked for in the manure. If the worms are small and red in color (blood worms or schlerostoma equinum) they will be found difficult to kill and the generous feeding is imperative to strengthen the colt against the ravages of the pest.

St. John's-wort Poisoning.

WHAT is the St. John's weed and what effect will it have on cattle pasturing in a meadow where it is supposed to be found? Will it poison them at any time or just when it is in bloom? My cattle had been poisoned. Their legs broke out in scabs and were very sore. I would like to pasture the meadow again, but do not know whether it would be safe. H. J. S.

This weed when in blossom causes sores or an eruption on the white skin of the lips, face and legs of horses pasturing infested meadows. The proper treatment is to apply with a brush and rub in once daily a mixture of two ounces of hyposulphite of soda dissolved in a half pint of water to which add when cold half a pint of cottonseed oil and two ounces of sulphur and then shake well. It should make a creamy emulsion.

Weak Horse.

MY horse, 10 or 12 years old, weighing 1,000 pounds up to a year ago was a good all around animal, and a cheerful driver. Then he began to look bad and drive dull. I had his teeth fixed, fed him for worms and later indigestion according to A. S. A.'s instructions I saw in THE R. N.-Y. I had him clipped and took good care of him all last Winter. Early Spring he grew worse, got so he would go to one side on the road, didn't care anything about the touch of a whip, fall back on the halter, hang his head down; didn't drink very well but would eat all right. He looks well now, but seems to be going back again; when he goes on a drive, say 10 or 12 miles, and it is hot, he staggers a little and does not want to go faster than a walk. G. C. E.
Maine.

The horse apparently has been overheated at some time in its life and the treatment we have often prescribed here for ordinary indigestion would not be likely to avail in such a case. He may do better if you give him one dram of fluid extract of nux vomica and half an ounce of Fowler's solution of arsenic night and morning and cut the grain ration in half. Make him work or run out every day and feed lightly. Too much feed seems to aggravate the case. Work him in a breast collar.

Tumors of Udder.

CAN anyone tell me what is the trouble with my brood sow? There is a swelling around one of her teats? It seems like a boil. Sometimes three of these will come up. After awhile they break and pus comes from them. Then they heal over after remaining very red and raw for a few days. I wash the part with a solution of carbolic acid and then rub on a drawing salve. Her pigs were born in February and she was all right until after we turned her out about the last of May. In the barn she had oat straw for bedding. Could that have caused it? I also fed her oat fodder cut green; this together with her regular feed of milk, potatoes and a light feed of grain. E. W.
Vermont.

In such cases the tumors usually are due to invasion of the parts by the ray fungus (actinomyces) which causes also the lumpy jaw conditions in cattle. The best treatment is to cut out the tumors and cauterize the wound, but hogs often die of shock and loss of blood when this is attempted. It is not at all likely that the case will prove curable without the operation; but you might try swabbing once daily with tincture of iodine. It is best not to breed an affected sow.

Balky Broncho.

CAN you give me a little information as to the best way of breaking a broncho mare of balking? She is a good traveler when started but at times it takes one hour to make the start. When harnessed she will stand and make no attempt to go and there is no making her until she just gets ready. She is not green but has not been handled right at the start. J. H. W.
New Jersey.

As a rule it seldom pays to fuss with a broncho of this sort. It is best to let some professional horse-breaker tackle the job of training and even he may not succeed. There is no specific cure. Remedial measures are many. One good one is to throw the horse and "hog-tie" him; then let him lie there for an hour or more. An experience of this sort applied two or three times may suffice. Another plan is to draw the head around to the side and tie the halter rope to the tail to keep the head in that position; then make the horse run around in a circle until he drops. Your neighbors will suggest many additional plans of treatment which may be tried in turn and if all fail let some dealer have the beast.

Shoe Boil; Cough.

HOW can I cure a shoeboil? My horse had a shoeboil the size of an egg when I bought him five years ago; this year it started to increase in size and is now about size of an apple. He has a wide stall. 2. What is good for a cough? I must give something direct, as he will not touch grain containing medicine. J. H. B.
New York.

1. The correct treatment for an established shoeboil is to have it amputated. The operation is simple and but a small scar will remain. A noose of piano wire is put over the neck of the shoeboil and drawn very tight to make the neck as small as possible; then the neck is severed by means of a cherry red-hot hatchet-shaped firing iron, or by means of a knife, to be followed by a hot iron to stop bleeding which will be profuse. Afterward wet the wound three times a day with a mixture of one ounce of sugar of lead, six drams of sulphate of zinc and water one pint. Label the bottle "poison" and shake it well before use. The horse may be put under the effect of chloroform, or some other anesthetic so that the operation will be painless. 2. Cough is simply a symptom of irritation which may be due to any one of a large number of causes. You give no hint as to the probable cause in this case. Possibly heaves is present, but it would be best for you to write again and give full particulars. A. S. A.

"WHY don't you brush your hair?" asked the man of the boy with the frowsy head. "Ain't got no brush." "Why don't you use your father's brush?" "He ain't got no brush." "No brush? Why hasn't he a brush?" "Hain't got no hair."—Melbourne Australasian.

SPREADERS $64.75 UP

RAISE BIGGER CROPS
My New No. 8 Low Down Manure Spreader

used now means bigger crops next year. You know this yourself. Manure spreading time is all the time. This new No. 8 Low-Down Manure Spreader is Galloway's greatest spreader.

Positively the best spreader on earth. Double chain drive, endless apron; force feed; front wheels cut under load; close hitch; lightest draft of any low-down machine. Capacity 60-70 bushels. All steel gear, complete with double-trees and neck-yoke. Flexible rake; high speed beater pulverizes finely any barnyard material. Steel wheels; gears coupled with channel steel, trussed like a steel bridge. Box rests on rear trucks, 42 inches high. Superior in every respect to new fangled freaks of heavy draft that eat you up for repairs, annoy you and kill your horses.

K. K. Foust, Ashley, Ohio, writes: "Please find draft for spreader received October 5th. Assure you I am more than pleased with same. It has proven all you claim and more. By buying of your company, I saved $21.80 and got just what I was looking after."

My Book "A Streak of Gold" FREE

tells all about handling manure to get the greatest profit. Do not buy a spreader of any make at any price until you have dropped a postal asking for this great book worth $1.00 (costs you nothing) and my BIG SPECIAL SPREADER CATALOG that tells the truth about the spreader business. Mailed free. Get RIGHT on this spreader proposition before you buy.

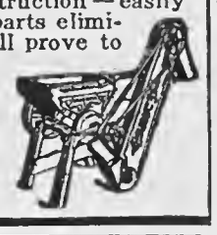
Save ¼ On Feed

Practical farmers and stock raisers know the value of the corn ground with the cob. Fatten your stock quicker and at less cost by using the

New Holland Feed Mill

It grinds cob corn, shelled grain and table meal perfectly. Simple in construction—easily operated. All troublesome parts eliminated. An examination will prove to you its many superior qualities. Real money-makers for the farmer. Write for low prices and free trial offer today.



NEW HOLLAND MACHINE CO.
Box 41, New Holland, Pa.

KELLY DUPLEX GRINDING MILLS

Easiest Running Mill Made. Fully Guaranteed

Grinds ear corn, shelled corn, oats, wheat, barley, rye, kaffir corn, cotton seed, corn in shucks, alfalfa, sheaf oats, or any kind of grain. Bagger has a double spout attached to either side of mill. We furnish extra hopper for grinding small grain and ear corn at the same time. Only mill made with double set of grinders or burrs. Have a grinding surface of just double that of most mills of equal size, therefore, do twice as much work. Requires 25% less power. Especially adapted for gasoline engines. We make 7 sizes. *Write for Free Catalog.*

DUPLEX MILL & MFG. CO., BOX 320 SPRINGFIELD, OHIO

EAR CORN
WHEAT · OATS
SUPERIOR FEED GRINDERS

Increase the value of every crop you harvest by grinding it fine or coarse before feeding it to your stock. Save time, labor, fuel, money and get better results with

Simple, powerful, efficient, durable and economical. Double grinding rings. Automatic Force Feed prevents choking. Self sharpening. Money back guarantee with every mill. Write today for Free Catalog R and samples.

SMALL GRAIN

Black Wall Map of the World

The World and the United States At A Glance

A Great Education
At Your Fingers' Tips

This beautiful Wall Map, size 25x39 inches. On one side we have a complete, up-to-the-minute map of the United States in bright colors, showing the Capitols, Railroads, Rivers, large cities, etc. It also shows portraits of our 27 Presidents, and gives their biographies.

On the reverse side we have a map of the world, printed in a deep, ebony black. White and colored lines differentiate countries, rivers, lakes, cities and mountains. You never saw a map as black, as beautiful, as wonderfully enlightening as this map of the world. From this you may in a single day learn more than you could in a year's study of books.

Contrasting with the ebony black of the map are the flags and the coat-of-arms of all nations, in their flashy, exquisite colors. Our own seventeen flags are here in beautiful, bright colors—did you know that the United States had seventeen different flags?

And then, there's that wonderful Bible information. How many books, chapters, verses, words, letters does the Bible contain? How many books are classified as History, Poetry, Law, Prophecy, Epistles? Which books are exactly alike? How many times is the name of our Saviour mentioned? In how many languages is our Bible published?

Wouldn't you want to know these things? And wouldn't you want to know the many, many other things this marvelous Map of Knowledge possesses?

The Map will be sent, postpaid, for One New Yearly Subscription, or Twenty 10-Week Trial Subscriptions, or Two Yearly Renewal Subscriptions.

FEEDING PROBLEMS.

Rye for Ducks and Hogs.

WHAT do you think about feeding rye to ducks? Which is the better way to feed rye to hogs, whole or ground?
C. E. B.

Most kinds of stock will not eat whole rye unless they are forced to do so through hunger. Throw down a handful of mixed grain and the hen will pick out the corn, wheat, buckwheat, or oats, and leave the rye. The best way to dispose of the rye for feeding is to grind it, half and half with either corn or oats, and feed it in a mash or slop. In this way practically all of the rye will be consumed. Hogs will not eat the whole grain of rye. Put them into a rye field and they will eat the grain and break down the straw. They will do much better, however, when the rye and corn are ground together and fed as a slop or as thick mush. The rye is not as good in feeding cattle as corn.

The Use of Frosted Cornstalks.

I FOUND so much to do in the Spring on my newly acquired farm, that I was late in getting my corn planted. Consequently I have only a two-acre field of small stalks and a few nubbins. When cutting time came I was still behind in my work, and as the apples seemed more important than the corn I let it stand. It has now stood uncut through several severe frosts. Would the stalks be harmful to feed to a horse or cow if cut now and stored in the barn? If so, what else could I best do with them? Would they be good to cover my Fall-set strawberry plants? I have started to cut the stalks and put them in the barn, but a neighbor told me that the frosted stalks would be bad to feed any stock. H. S. M.
Connecticut.

Such fodder makes very poor stock food and unless you try to starve them to it the horse and cow would not eat enough to do them any harm. They would simply pick over the stalks, nibble a little here and there, and leave the rest. In some parts of the West where the stalks are left in the field, and the cattle turned into harvest them, there have been cases of injury from eating these stalks, unless the cattle had some kind of laxative food in addition. You can run these stalks through a cutter, and then use them for bedding as an absorbent. The stock will nibble a little of the better portions and leave the rest, which would make a good absorbent and add to the manure. In our own case we should cut these stalks and use them whole for mulching the strawberries. They do quite well for this purpose, as they do not mat down over the plants, and at the same time protect them from being thrown out when the ground freezes and thaws.

Dairy Ration Without Hay.

IS there any combination I can make with chopped straw, molasses, grain and cottonseed meal to take the place of hay for milch cows? In Europe I have seen successful farmers feed chopped straw, pulped mangels and a sprinkling of mill stuff, bringing good results without hay, and think it possible a combination of commodities mentioned might be made satisfactory, even though we have no mangels to put in it. I shall feed corn silage with the proposed combination, but wish to eliminate the hay if possible.
F. P.

It should be remembered that the practice of feeding mangels, straw and oil cake that prevails in Scotland is utilized under a system of dairying that differs materially from that prevailing in this country. The Scottish farmer or cheese-maker does not dairy extensively during the Winter months, but relies chiefly on the luxuriant pasture grass as a source of feed for his animals when they are in full flow of lactation. For the most part the mangels, straw and oil cake are fed to dry cows, or those giving relatively small amounts of milk, for it is rather the exception for the Scottish farmer to have his animals freshen in the Fall. Furthermore, the reason why he is able to utilize the straw, is because mangels furnish an abundance of succulence, and straw is primarily a filler. The high cost of labor in this country, of course prohibits the growing of mangels extensively, and silage being in itself bulky does not require a coarse fodder such as straw to bring about proper digestion of the food. The molasses would no doubt make the straw more palatable, but there is very little food value in oat straw, and I would very much prefer utilizing corn fodder as a source to straight Timothy or even mixed hay, and I am satisfied that the straw-molasses-cottonseed mixture might be used for dairy cows and heifers, provided some corn meal and some corn fodder were added, but I do not think the plan suggested would apply successfully to dairy cows of great capacity or high production. F. C. M.

Dairy Ration.

WILL you give me a balanced ration for a four-year-old Jersey from the following: Mixed hay, some Timothy and Blue grass, also cornstalks, cut up, without corn on. I can buy yellow cornmeal at $1.80 cwt.; wheat bran, $1.45; flour middlings, $1.75; gluten, $1.70; brewers' grains, $1.55; cotton-seed meal, $1.80; old process oil meal, $1.90; distillers' grains, $1.80. F. C.
New York.

For the grain ration feed three pounds cotton-seed meal, two pounds brewers' dried grains, one pound oil meal and one pound bran. A good way to feed the cut corn fodder would be to wet it and then scatter the grain over it. Give all the roughage the cow will eat. It will be well to feed out the corn fodder during the early part of the Winter, as it becomes dry and unpalatable with long keeping. C. L. M.

Ohio Rules for Dairies.

COWS must have a clean bed, fresh water, and be kept clean hereafter in Ohio, according to the rules for dairies issued by the State Dairy and Food Department. If the cow has a swollen jaw, inflamed udder or ulcerated teat or running sore her milk must not be used, and cows known to be afflicted with tuberculosis or any other contagious disease must be removed from dairies. The barn must be on well-drained location, and mud holes, manure piles, or stagnant water within 100 feet is a contamination. The barns must be ventilated by an automatic system or adjustable windows, and at least 300 cubic feet of air space must be provided and two square feet of light for each cow. Manure must be removed daily a distance of not less than 40 feet to preclude the possibility of odors getting back unless sufficient straw, shavings or absorbents are used. Floors must be kept clean by careful sweeping or washing, and an earth floor must not be used, the walls must be free from manure, must be whitewashed or made clean and sanitary or disinfected. Utensils must be of smooth non-absorbent material, the seams of which are flushed smooth with solder. After being washed in cold water, they must be scalded with boiling water or steam and inverted in pure air to drain. Milking must be done in clean suits with clean dry hands and udder of cow must be clean before being milked. As soon as drawn, milk must be removed from stable and cooled to temperature of at least 60 degrees. The milk house shall be located on well-drained land, free from contamination, must be well screened, protected from intrusion of flies, fowls and animals.
W. J.

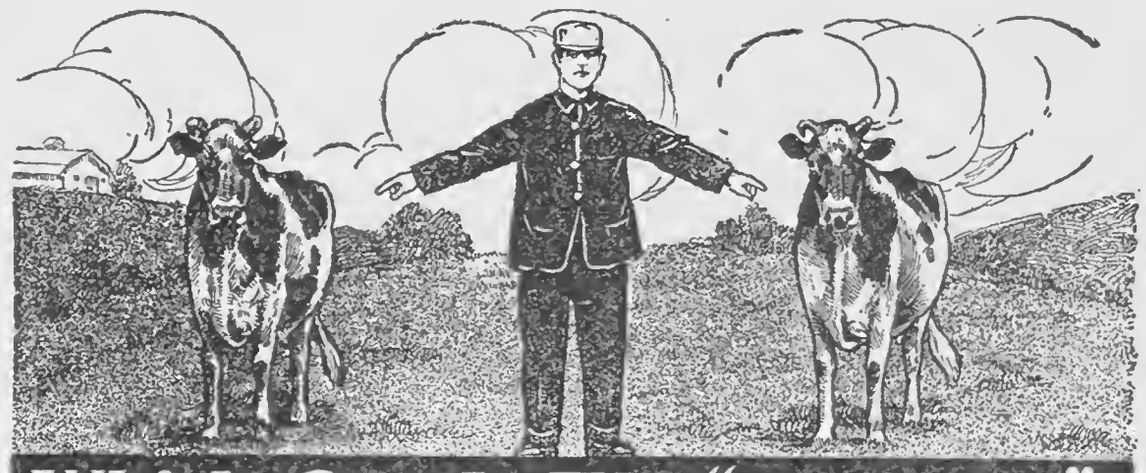
You or the Cow?

"THERE are more men keeping cows than there are cows keeping men." That is a statement a dairy expert made in Chicago and a prominent speaker said: "It takes less than two minutes a day to determine the value of the cow, less time for the herd than you devote to the one or two unproductive animals. This determining process is very simple, the scales and the tester. In the store business we would keep account of losses and gains, and if loss wiped out profit we would be looking for the leak. It might be in bad accounts, and when that person came to us to get trusted for the week's supply of groceries, he would find his name blacklisted, or in dairy language would be classed among boarders. The local merchant would not think of keeping a half dozen families in the community year after year. He would not allow them to run hopelessly large accounts, and at the end of the year tear up the sales slip and let them start all over again imposing on his business abilities, taking out nice slices of profit from productive customers, and forcing him to carry an excessive stock. For my part I would rather have the cow keep me than keep the cow."

ONE authority says: "A dairy cow to be called such should repay her owner for every pound of feed, every hour of labor and also interest on his investment." He makes it clear that the difference between a good and a poor cow, is often merely in difference in feed. He says: "Cows that give milk rich in fat should receive the larger amount of grain. The ration of the dry cow should afford her opportunity to get in good condition for the next lactation period."

THE Holstein-Friesian cow Duchess Hengerveld Korndyke No. 131752 has broken the record for fat production in the senior three-year class of the semi-official yearly division, by producing in 365 consecutive days 903.38 pounds fat from 22,897 pounds milk. She freshened at the age of three years nine months, 19 days. Her sire is Judge Hengerveld De Kol No. 43964; her dam is Duchess De Kol Korndyke No. 52905. She was bred by Mr. O. A. Stubbs, Lewisville, Ind.; and she is now owned by Emblagaard Dairy, Big Bay, Mich.
MALCOLM H. GARDNER.

"DON'T fish go about in schools, papa?" "Yes, Earlie. Why?" "Oh, I was just wondering what would become of the school if some fisherman happened to catch the teacher."—Springfield Republican.



Which One Is The "Boarder"?
Looks Don't Tell But This Record Will—
FREE

Clover Leaf Dairy Feed

Has proven by test to be the most economical feed for practical dairymen. Why pay $32.00 per ton for a ration when you can get the same analysis at $4.00 per ton less—a feed that is far more palatable and easier digested.

CLOVER LEAF DAIRY FEED

is the most popular feed in the Eastern States today. A very close tie exists between it and the profitable dairy. Ask your dealer. If he cannot supply you write to us.

CLOVER LEAF CALF MEAL

"The Malted Baby Food for Calves". National and State authorities agree that it pays to raise good calves instead of buying cows at $80.00 or $100.00. Calves can easily be raised on

CLOVER LEAF CALF MEAL

at one-fourth the price of milk. Feeding instructions in every bag. Ask your dealer. If he can not supply you write to us.

74% "Boarders"

Official investigation during 1913 proved that 74% of milch cows in Illinois were kept at a loss. The same thing has been proven true in other states. Do you know which cows in your herd are paying and which are losing?

For the benefit of dairymen and farmers we have compiled the

CLOVER LEAF FARM RECORD BOOK

It enables you to know where you are losing money and where you are making—that means increased profit. This book is Free. Write for it today.

The Henyard.

Selecting Layers.

THE old theory that a hen is a hen, and that they all look alike, act alike, eat alike and produce the same number of eggs each, has been exploded by the modern system of selecting the best layers by their actual performance at the nest. To keep individual records of a large flock of hens, however, entails such a great amount of detail work that very few people have been willing to devote the necessary labor and expense for this purpose, so the average poultryman is left to rely on his judgment as to which will lay the most eggs in a year. There has been a great deal of discussion over the question of whether there is such a thing as an egg type or not. It is my personal opinion that you might just as well ask if there is a dairy type of cow or a roadster type of horse, as an experienced poultryman or woman can see just as much difference between good laying hens or pullets which will develop into good layers, and those which will not, as a dairyman can see between a good cow and a poor one. Of course to become expert it takes long years of study and practice before reliable results can be assured, but by close observation it is certainly possible to judge fowls for their laying qualities as well as for fancy points.

The first thing to look at in a utility hen is her weight in comparison with her size. She should be heavy, but not extremely large. A Leghorn hen should weigh at least three pounds, and four pounds weight is not objectionable, but either under or over these weights should be avoided as much as possible. The comparatively small hens among the larger breeds are usually better layers than those which are up to standard weight or above.

We have all heard the old story about the prize winners being the best layers—that is, they are supposed by their owners to be when making sales to amateurs at long prices—but since the laying competitions started such methods have gradually become less popular, because purchasers as a rule now want to see what they are getting. Practically all pure-bred cattle are now sold on their records of production or the production of their ancestors, and this is what the poultry business is coming to at a rapid rate, breeders demanding performance instead of plumage, and shape instead of symmetry.

It is not easy to select the best layers in a pen without keeping individual records, but a few suggestions may be helpful to the poultrywomen who are enering birds for the R. N-Y. Hen contest, and others who wish to keep their best stock and discard the drones.

To be a good layer a hen must be a good feeder—able to eat and digest a large amount of feed. This requires a strong vigorous constitution and an active disposition, not inclined to be too nervous or flighty. In shape she should have a long wedge-shaped body carried quite erect, with fairly long legs and neck and a large bright prominent eye. The head should be wide and well shaped, and the pelvic bones thin, sharp and wide apart when in laying condition. High tails are also an indication of strength and laying ability—statements to the contrary by our standard makers notwithstanding.

After all the experience which may be gained by years of study there seems to be some natural intuition necessary to select good layers which is possessed by but few people. Under ordinary conditions it pays to keep individual records of a few of the best hens in a flock, and breed all the males used from the highest producing hens. MRS. C. S. GREENE.

Sktm-milk for Hens.

IN feeding skim-milk to laying hens to take the place of meat scraps, should it be sweet or sour? While I am aware of the fact that sour or buttermilk is the proper way to feed for fattening purposes, on account of the lactic acid it contains, I had always supposed that it should be feed sweet to get the largest food value, until I was advised recently by a person who should be authority to feed it sour. D.

It was first supposed that the milk should be soured before feeding, and that the lactic acid developed in souring was necessary to obtain the beneficial effect, I mean the effect of increased growth and vigor. But there is another effect—highly beneficial—which is due to the lactic acid; and that is the making of conditions in the intestines and the blood of the chick, which are unfavorable for the growth and development of harmful bacteria. Experiments at Storrs, Conn., have shown that chicks hatched from eggs containing the white diarrhœa germs, if fed on sour milk from the start, did not show any signs of that disease; the lactic acid preventing the development of the "bacteria pullorum," the disease germ.

Prof. Hadley at the Agricultural Experiment Station at Kingston, R. I., found that the feeding of sour milk had the same effect in preventing the fatal "blackhead" in turkeys. The harmful bacteria—or bacilli—could not multiply in sufficient numbers to do any harm in the acid condition of the intestines, produced by the sour milk. Later experiments at Storrs seemed to indicate that sweet milk was equally effective, but most likely the sweet milk sours soon in the chick, where the heat is 106 to 107 degrees. Milk is at its best as a feed when it is loppered, and it requires about 80 degrees of heat to produce this. It should not be left in the dishes until it gets foul, dirty, and begins to decay. To prevent little chicks getting into the milk, use shallow graniteware pans about an inch deep, and cover these pans with poultry wire netting. This allows the chicks to dip their beaks into the milk, but prevents their getting daubed up with it, as they will if the milk is not covered. GEO. A. COSGROVE.

Hens Going Light.

WILL you tell me what is wrong with my hens? Last Spring we had 65 hens, we now have 34. Five of these are lame, but they are fat, so I think they are all right for food. Their roost is about three feet high, and they are heavy hens (Barred Rocks) perhaps that accounts for their lameness. Those that died got poor, as if they were starved, but they were fed with other hens that were fat. I shut the poor ones up to fatten; when I thought they ought to be fat, they were as poor as ever. Finally they could not stand and soon died. In the early Summer we fed some corn that was musty; they did not eat much of it, as they had free range. In the Spring we bought four roosters. They were fine birds but after we had them a while, they seemed to walk as if they had sore toes; one of them died. F. P.

Michigan.

These fowls were very likely suffering from the disease known as "going light," an infectious disease which attacks some fowls and by interfering with digestion of their food brings about wasting of the flesh and, finally, death from exhaustion. This disease does not spread rapidly and usually takes only a few of the flock. It can be guarded against by killing affected fowls and destroying their carcasses, while attention is paid to cleanliness of their quarters. If a considerable number of the flock are affected, they should be rigidly culled out and special pains taken to clean and disinfect the living quarters and utensils used. Boiling water for utensils and whitewash for walls, perches, etc., should protect the healthy members of the flock. M. B. D.

Soaking Alfalfa; Feather Eating.

DOES the ordinary short-cut Alfalfa make a satisfactory Winter green food, after being soaked in cold or hot water, and, if so, how is it best prepared? 2. Does a great appetite for eating feathers show a lack of any particular element in the feeding? Some of the half-grown birds are constantly about the place where we dress chickens, and eat largely whenever they get a chance at the feathers. J. F. T.

Short-cut Alfalfa is an excellent green food for Winter use and may be prepared by putting the required amount into a bucket, pouring boiling water over it, covering the bucket with an old blanket or coat and allowing it to stand over night in a warm place. If not eaten readily at first, a little feed may be mixed with it.

2. Feather eating is supposed to indicate a lack of animal food in the diet, but it is also a habit readily acquired by fowls that get a taste of the soft green quills. It is safer to keep the feathers away from the chickens and see that the latter are supplied with animal and green foods. M. B. D.

Removing Stains from Eggs.

IN October a reader asked how to remove stains from market eggs. "Scrubbing with some scouring material," as advised by your question expert hardly fills the bill when it comes to grass stains, besides being hard on weak-shelled eggs. Here is the California commercial egg seller's method. I learned it from an egg peddler whose business it was to travel through our canyons and gather up the eggs from the farmer folk. His profits came from his skill in reducing the promiscuous assortment to order and attractiveness for his city customers, and making the soiled, stained, and stale-looking eggs appear like yesterlaids.

Wash all the loose dirt from the eggs in plenty of clear cold water; place the eggs to drain in a colander. Have ready a saucer of sharp vinegar and a clean white cloth. Every egg that is stained or has a dull, stale appearance wipe with the cloth wet in the vinegar. Little rubbing or vinegar is required unless the stain is very deep. When much vinegar is used on the egg rinse afterwards with a dash of cold water. The philosophy of the method is that the sharp vinegar acts on the lime of the shell, removing an infinitesimal coating from the egg and making it appear as though just from the egg mint. M. RUSSELL JAMES.

AN old colored man was relating to a crony his experiences during a drive down the mountain after dark. He had seen two wild cats fighting. "Dey fought and dey fought," he said, "an' all de time dey wuz a-climbin' up in de air, till by'm by dey wuz clean ovah de treetops." "What wuz dey a-holdin' on tu all de time dey wuz a-climbin', Rastus?" asked the skeptical listener. "Holdin' on tu!" exclaimed Rastus scornfully. "Wy, de top one wuz a-holdin' on to de bottom one, an' de bottom one wuz a-holdin' on to de top one, of course!"—New York Evening Post.

CORNELL GASOLINE BROODER HEATER
Improved 1915
Equal to five Kerosene Heaters
Recommended by the New York State College of Agriculture
Will burn any kind of Gasoline
PRICE COMPLETE $10.90
CAPACITY 250 CHICKS
Cares for 250 Chicks
Needs little attention
No lamps to trim
No ashes, dirt or soot
Absolutely safe
Perfect ventilation

Get the Eggs NOW While Prices are High
GILBERT HESS, Doctor of Veterinary Science, Doctor of Medicine

This is the time of the year when the price of eggs is high and your hens ought to be making up for the small egg crop during moulting.

But hens need a tonic during the winter months, because the lack of exercise and green stuff and also close confinement impairs the digestion, makes the system sluggish and the egg organs dormant. With the knowledge I have gained in a lifetime experience as a veterinarian, doctor of medicine and successful poultry raiser, I have succeeded in compounding a scientific preparation that will make poultry healthy, make hens lay and keep the egg organs vigorous and active.

Dr. Hess Poultry PAN-A-CE-A

contains ingredients for toning up the digestive system and enriching the blood. It also contains tonics for toning up the dormant egg organs and making hens lay, internal antiseptics for preventing and remedying gapes and other ailments, also bone and shell forming ingredients. Every single ingredient in my Pan-a-ce-a (printed on every package) bears the recommendation of the U. S. Dispensatory and other high authorities. Now read this carefully:

So sure am I that Dr. Hess Poultry Pan-a-ce-a will make your poultry healthy and make your hens lay that I have authorized my dealer in your town to supply you with enough for your flock, and if it does not do as I claim, return the empty packages and get your money back. Buy now on that guarantee.

Sold only by reputable dealers whom you know, never by peddlers. 1½ lbs. 25c; 5 lbs. 60c; 25-lb. pail $2.50 (except in Canada and the far West). Pan-a-ce-a costs only 1c per day for 30 fowl.

My new poultry book tells all about Pan-a-ce-a. It's free.

DR. HESS & CLARK, Ashland, Ohio

Dr. Hess Stock Tonic
Your cows, horses and hogs are pretty apt to get out of fix during winter, because grain, hay and fodder do not contain the natural laxatives and tonics so abundantly supplied in grass. Lack of exercise is another thing that retards good health.
Dr. Hess Stock Tonic contains tonics that improve the appetite and tone up the digestion, laxatives for regulating the bowels, and vermifuges that will positively expel worms. I guarantee it. 25-lb pail $1.60; 100-lb. sack $5.00; smaller packages as low as 50c (except in Canada, the far West and the South).

Dr. Hess Instant Louse Killer
Kills lice on poultry and all farm stock. Dust the hens and chicks with it, sprinkle it on the roosts, in the cracks, or if kept in the dust bath, the hens will distribute it. Also destroys bugs on cucumber, squash and melon vines, cabbage worms, etc., slugs on rose bushes, etc. Comes in handy sifting-top cans, 1 lb. 25c; 3 lbs. 60c (except in Canada and the far West). I guarantee it.

The Henyard.

THE EGG-LAYING CONTEST.

THE third week of the contest at Storrs shows a total output of over a thousand eggs; 1039 is the number laid. Edward Cam's White Wyandottes make the highest score for the week, viz., 46; their total to date being 119. Windsweep Farm's White Leghorns, after taking the highest place for two weeks drop to second place this week with a score of 41; but in the total they outrank all other pens with a record of 137. This is a 65% "lay" which isn't very bad for November. Hillview Farm's R. I. Reds tie with Merritt M. Clark's White Leghorns for third place, each pen laying 37. The results obtained at the different contests, as an indication of whether actual progress is being made in increasing the average egg production of American poultry, are worthy of note. At the contest at Thorndale, Pa., the number of birds has continued the same, viz., five each year. This is now the fourth year—the first two years the record was made at Storrs. Below is the yield for the first three weeks, each year.

	1st year.	2d year.	3d year.	4th year.
First week	91	184	212	342
Second week ..	180	287	295	509
Third week ...	315	474	494	607

These remarkable gains are partly due to increased knowledge as to how to select and prepare the birds for a good start; but the annual reports for the total year's production also show a gain each year, the figures for the last three years being 76,230, 11,016, and 84,210. The gain of over 7,000 eggs the last year, or more than 14 eggs for each hen in the contest, with the lowest mortality ever known—only eight hens dying out of 500—was an accomplishment to be proud of. Tom Barron's White Wyandottes won this Thorndale contest just closed, with an output of 1180 eggs; the record of the five birds: 282, 252, 183, 189, 274. These birds are now the property of Mr. Robert Morris of Connecticut. As Connecticut also has Lincoln's White Leghorns, and A. B. Brundage's S. C. Rhode Island Reds, the Nutmeg State feels inclined to *crow* and call the attention of the rest of the United States to the fact that this is the place to come when they want the best. GEO. A. COSGROVE.

New Corn for Poultry.

WILL feeding new corn to pullets or old fowls hinder them from laying? If so, will the effects be the same if the new corn is thoroughly heated each time before feeding? I have heard many opinions on the subject, but have never seen it mentioned in poultry books or papers. R. F. T.

There is nothing deleterious to either pullets or hens in new corn, and there is no occasion for heating it before feeding. It may have acquired a bad reputation from the fact that it becomes available at a time of the year when hens naturally cease laying and also because there is a temptation to make it the exclusive food when it is comparatively abundant and cheap. M. B. D.

Price of Indian Runner Duck Eggs.

WE have heard many varying statements about the prices to be obtained for eggs of Indian Runner ducks in the city markets. These statements vary so that in order to settle it we wrote a large number of egg dealers asking for the facts. Most of them reply that they know little or nothing about these eggs. The following statement comes from Baltimore:

During February, March and April (before Easter) of each year there is a premium on all duck eggs, the White Pekin duck eggs being the favorites. This premium will sometimes be as much as 15 cents per dozen but after Easter the premium very quickly fades away and a discount on duck eggs soon appears, and during the warmer months duck eggs and especially the Indian Runner duck eggs sell at a price under hen eggs. This discount varies from one to three cents per dozen. After the weather warms up and until the following February no one seems to want duck eggs and they are rather a drug on the market and hard to sell even at the discount. We can see no advantage in the Indian Runner duck, though he does outlay the other varieties, as the eggs are at a discount the greater part of the year. Indian Runner duck eggs average quite a little smaller than the eggs of the other varieties of duck. BLATTER BROS.

PUBLISHER'S DESK

E. G. LEWIS of St. Louis, and California, has a new scheme, or to be more exact, an old scheme in a new dress. If you subscribe for his paper and pay for it, or induce your neighbors to subscribe for it and pay for it, he will give you shares in a California oil company. That is not so startling in itself; but if you read the Lewis inducements you must conclude that he is conferring an unusual favor on you, and that sudden riches are to be showered upon you. It is nearly 20 years since Lewis started in the cheap publishing business with an endless chain scheme that was suppressed by the post office authorities. Since then he has launched probably as many as 100 schemes, large and small. His collection on them we would estimate at not less than twelve million dollars, and every cent of it has been a loss to the people who furnished the money. In the past, Lewis' strong pull has been from women; but he has also made some rich hauls from men, and some of them hard-headed men at that. Any man who looks broadly on the Lewis schemes will discover the fake in them, but if he confine himself to one and give Lewis a chance to make explanations, he is in danger. Lewis does not invent new schemes; but he has a wonderful genius for new applications of old ones, and he is plausible enough to discover anyone who is unfamiliar with his record and susceptible to suave mannerisms.

I have just received Lehigh Valley Railroad voucher for $11.03 for the seven barrels of apples shipped to Baltimore September 12, 1912. These apples were 10 days on the road and reported by the commission house as in bad shape, and sold for $1.00 per barrel, when the price for good apples was $2.75. I made claim promptly for the difference, and received reply two years ago that there was no unusual delay and they were not responsible for freight getting to its destination any special time, but it seems you persuaded them different. Many thanks. It seems almost like a dream to be able to follow up an account of that kind and I believe the anti-fake movement is one of the best things that has been started. But we are not to look at big transportation companies as fakes and dead beats, although perhaps they have too much of the "public to be Vanderbilted" attitude, and try to wear farmers out with red tape. I am sending check for renewal and ten weeks trial for a friend. H. A. S.

New York.

We were obliged to unroll considerable red tape before we could get this claim under way for adjustment, and there was no reason why it could not have been paid at any time during the last two years, for the facts were clear and verified all along the line.

I am not going to bite myself, but the inclosed letter may help you protect some of the credible who wolud later come to you with complaints because they get nothing out of something.

New York. F. W. R.

The letter is from an alleged wheat specialist of New York City. He says it is the opportunity of a lifetime for the small investor to get rich through sending money to him to speculate in wheat. He says he is not infallible, and has some losses which he can limit. He says profits are larger than limited losses. He must be a wise man sure; but why limited losses? Why not profits all the time? If he can limit losses, he should prevent them entirely. But why does he want to speculate on a sure thing for you? One would think that he would get rich himself and have done with it. The truth is he can bet that wheat will go higher or lower, and take his chances like anyone else. Flagg went to jail last month for receiving money for alleged speculative purposes, and for using the mails to defraud. He promised one per cent. profit a week, but the investors have not been able to see the profits.

About the first of August I ordered from William K. Hesser of Pottsville, Pa., 36 White Leghorn pullets, 11 weeks old, which he assured me were pullets of quality, and for which I paid 55 cents each, $19.80 for the lot. I received the birds August 5, and a poorer, more stunted, under-sized lot of birds I never saw—not only were they all this, but at least two-thirds of them were cockerels. I wrote him at once about them. In reply to my first letter he said he did not guarantee satisfaction and would do nothing. Since then I can get no reply to my letters. The cockerels after feeding them up for four weeks, I was able to sell for 25 cents each. The pullets were so small I could not sell them at any price, so gave them away to get rid of them. I am out in cash $12.55, to say nothing of feed and express and drayage, which I think Mr. Hesser ought to make good. I may not get anything out of this, but it may be the means of saving some others. R. L. H.

Virginia.

We have exhausted every effort to induce the poultryman, Mr. W. K. Hesser of Pottsville, Pa., to make a fair adjustment with the Virginia subscriber, but our letters have been entirely ignored. The experience of R. L. H. would indicate that Mr. Hesser is a very good poultryman for farmers generally to avoid when looking for breeding stock.

An interesting feature of the creditors meeting was Mr. Haines' proposition to the stockholders. He proposed that each of the 1,500 stockholders secure at least five customers, each to purchase $25 worth of merchandise. This would net them over $1,000,000. He also planned that the present stockholders agree and pay for $100 worth of merchandise to be delivered at some future time. This would give the concern a new start. Cards were passed around for this agreement but few signed.

To the attorney of the creditors Mr. Haines admitted that he could not account for the sum of $50,000 paid in by the stockholders; that he always had absolute control of the company; that he never invested a single penny of his own money in the concern; that he selected his own board of directors from employes and fixed their salaries, and in return they fixed his salary; that the secretary of the company had disappeared; that the concern was in debt $30,000 and that the assets would not begin to reach that deficit.

The concern was promptly put into the hands of a receiver.—Camden, N. Y., Dispatch.

It is time we had some plain talk about transactions of this kind. Three and a half years ago we looked up this concern and published a warning in which we said in issue of June 28, 1911:

"There's Millions in the Haines System" is one of the characteristic expressions of their letters; but not a word or figures as to the actual assets of the concern, or the volume of business done. This proposition has all the earmarks of the promoter's stock selling scheme rather than a legitimate mail order enterprise, and we feel it is hardly necessary to advise our old subscribers to make some better use of their hard-earned savings.

Yet right down to a few weeks ago, farm papers that are now making hysterical denunciations of petty concerns that never advertise, have published illustrated advertising of the Haines' concern. This would be bad enough for papers that made no pretense of clean advertising columns, but some of these actually guarantee the character of the scheme. In this way they induce innocent victims of the scheme, who might be cautious if it were not for their pretended protection. Our advice to the victims now is to put in claims against the publishers who carried this advertising, and if they cannot get redress as we believe they cannot, then we will handle the claim for them without cost. It is about time something were done to stop this pretense of protecting the public by publishers who have no intention or purpose to do so. No publisher could claim he was ignorant of the nature of this concern without admitting that he ought to have a guardian. Haines' record was open to them, and the concern had on its face all the marks of a purely stock-jobbing scheme. What business and advertising was done, served only to pacify the papers and make a showing to attract investments in the stock, as THE R. N.-Y. publicly stated more than three years ago.

Haines' plan of reorganization is characteristic. It is on the old theory that men will send good money after bad in a vain effort to recover what is already lost.

One of the discouraging features of this failure is that the stockholders may not only lose their $144,423, but they may be obliged to make up any loss that creditors would otherwise suffer. The preferred stockholders got a bonus of common stock and attorneys think they may be assessed on this bonus stock to pay the debts of the concern. J. J. D.

MISS BLITHELY (interested in science): "Can one get a shock from a telephone?" Top Spiffkins (intent on ethics): "That depends, my dear young lady, on who is talking at the other end."—Harper's Bazar.

Deleware County, N. Y., Farm Bureau.

DELAWARE COUNTY is making an advancement since the establishment of the Farm Bureau. We have just formed two cow-testing associations with a total of 52 dairies, and have three in operation, making a total of five cow-testing associations that are working in the county at the present time, with a total of 3,200 cows. We also have at the present time three more associations that will start working by January 1, with a total of 2,000 cows, making a grand total of cows under test of 5,200. There seems to be a general awakening among dairymen in regard to this kind of work, and its value is not doubted. F. M. AVERY.

Minnesota as a Dairy State.

FROM grain farming to dairying is the gauntlet run by many States. Western Ohio is passing from the second stage, fat stock production into that of dairying. Minnesota is distinguishing herself as a dairy State. Some interesting dairy facts regarding this State are evidenced in that over 900 creameries are in operation in the State. That young women of the State might become interested in the industry, a department of farm butter making was inaugurated in connection with the dairy department of the State University, a decade ago. During the 10 years the attendance of young women enrolled has grown to 300. Minnesota has won for her high scoring butter 12 out of 14 banners. The State has a unique institution in the way of a State creamery at Albert Lea. This is owned and operated by the State. There is a cow-testing association only five years old, and it has over 5,000 cows under its surveillance. The headquarters of this association are at the University farm at St. Paul, and are under the direction of Professor McKerrow. The efficient training which is afforded by the State dairy school is the foundation of Minnesota's stand as one of the leading commonwealths in producing quality dairy products. Of the 14 banners offered by the National Creamery Butter Maker's Association, with the exception of one having been awarded New York State and another Illinois, the remainder were given Minnesota butter makers. In compiling annual records of dairy cows, Minnesota records the following: Weekly weighing of the cow, weight and butterfat test in milk each milking, pounds and composition of feed at each feed. W. J.

FAKE health certificates have frequently been issued, causing innocent purchasers of diseased cattle in other States financial loss, so that a conference of representatives from Kentucky, Michigan, Pennsylvania, New York and Ohio met at Columbus with the view of adopting a uniform policy in tuberculin testing of cattle. It was agreed that each State prepare a list of approved veterinarians, and these shall be authorized to issue health certificates to cattle they have tested. Such health certificates shall pass cattle in other States without approval of the State Veterinarian; copy of health certificate of local approved veterinarian be filed with State veterinarian. Veterinarians of good character and properly licensed on application will be placed on approved list, and in case of violation of trust or "sharp" practice, name shall be removed from approved list.

In regard to prices of farm products let me commend you for your statement to that South Carolina correspondent in recent date of R. N.-Y. in which you said there was a great difference between estimated values and cash values. As a rule, I believe farmers in making estimate values place them far above cash values. Cash values are what really count. As to prices of farm products around Charlotte, which has a population of some 50,000, prices are usually very staple except for vegetables and small fruits which vary with supply and demand. The following prices paid to farmers are approximately correct: Irish potatoes, $2 per bushel; sweet potatoes, $1; hens, 11 to 12 cents per pound; turkeys, 15 to 17; butter, 20 to 25; eggs, 30 to 32 per dozen; oats, 65; corn, $1. There are no commercial orchard of any size in the vicinity of Charlotte, though both peaches and apples of fine quality bring fancy prices. Fall pears sell readily from 75 cents to $1 per bushel. One township in the county, Berryhill, has become famous for growing watermelons; a few fine specimens weighing from 85 to 95 pounds, bringing the fancy price of from $4 to $5 apiece. These were bought and shipped to friends North, perhaps to your own city. There is good money in good melons around Charlotte. Most of the cattle kept around Charlotte are dairy cows, the product of which furnishes the Charlotte milk supply; one plant handling 700 to 800 gallons per day. Most of the beef supply comes from East Tennessee and western part of this State, there being only two or three small herds of the beef type, Herefords, in the county. The local offering are mostly culls from the dairy herds which the farmers get from $4 to $5 per hundred live weight owing to the quality and condition.

Charlotte, N. C. J. N. B.

Wherever rubber footwear is worn you will see "Ball-Band" Rubber Footwear, with the Red Ball trade mark.

Men look for the Red Ball in Alaska, they look for it in Massachusetts, in Minnesota and in Oregon. In Colorado you see sportsmen with the Red Ball on the knee of their boots. "Ball-Band" Footwear is worn down in the mines of Pennsylvania, up in the woods of Maine and on every farm where dry, comfortable feet make hard work easier.

"BALL (Red) BAND"

Eight and one-half million men wear "Ball-Band" Rubber Footwear. 50,000 stores sell it. And the reason is that figuring the cost of rubber footwear on the cost per day's wear proves "Ball-Band" the cheapest.

Look for the Red Ball and if you see it you are safe, for you are getting "Ball-Band."

Free Booklet "More Days Wear"

This book tells how to treat your footwear so as to get the most out of it. Write for it. If your footwear merchant doesn't sell "Ball-Band" tell us his name and we will see that you are supplied.

Products, Prices and Trade.

Wholesale Prices at New York,

Week Ending Nov. 27, 1914.

MILK.

The Borden milk schedule to producers for the six months beginning with October is as follows. This is per 100 pounds in the 26-cent zone. This is what is known as the "maximum" for milk testing 3.8 to 4.2 per cent. fat, and is 20 cents per 100 pounds above the "flat" rate.

	1914.
October	$2.00
November	2.10
December	2.10
January	2.05
February	1.95
March	1.90

Wholesale prices paid by New York dealers are running $2.01 and $1.91 for B and C. Hotel and restaurants using two to three cans per day are paying five to six cents per quart, single quart prices from bakeries and grocery stores, six to seven cents; delivered milk, nine to 10 cents.

BUTTER.

Prices for the week closed one-half cent higher on top grade of creamery. Business dull in other grades. Danish butter has been arriving here in considerable quantity, recent shipments of 40 tons having sold at prices running from 32 to 34 cents. The butter is lighter and less settled than most of our make. It remained low for the Thanksgiving trade. A few strawberries from California have been received, selling from 25 to 50 cents per pint.

Creamery, extra, above 92 score, lb...	35	@	35½
Extra, 92 score	34	@	34½

Daisies, Wisconsin	14⅜	@	14¼
Skims, specials	13	@	13¼
Good to choice	11	@	12
Poor to fair	7	@	10

EGGS

The scarcity of fancy new-laid continues, but there is an abundance of medium and a surplus of grades below this. A strong effort is being made to move storage eggs at prices from 24 to 25 cents.

White, choice to fancy, large	56	@	60

Mixed colors, best	43	@	45
Common to good	25	@	35
Storage, best	24	@	25
Lower grades	18	@	20

FRESH FRUITS.

The apple market is in good condition on fruit running above medium in quality, lower grades very weak. As has been noted in previous years, there is heavy damage from slack packed apples. Probably not one shipper out of 10 whose apples are reported slack believes that it is true, as the barrels seem so tight when put up. There should be demonstrations on proper barrelling of apples at every farm institute, coöperative meeting, etc., where apples are a feature. This would mean the saving of many hundred dollars, particularly to small growers.

In the United States there are 760 Chinese and 2,502 Japanese farmers.

*

Southern men are planning a $100,000,000 corporation to handle and market the cotton crop.

*

The output of the Rhodesian gold mines, for 10 months, ending with October, was 709,810 fine ounces, valued at $13,243,000.

*

The six large sugar beet factories in Northern Colorado have paid growers $3,300,000 for beets this year.

*

The Kansas Board of Agriculture reports 8,870,000 acres sown in Winter wheat, or three per cent. less than last Fall.

*

Pennsylvania has sown about 1,325,20 acres in Winter wheat, or 13,100 more than last Fall. The corn crop of the State, on 1,463,000 acres, was well matured and of good quality. Buckwheat was injured by drought so that only 85 per cent. of an average yield was had. There were 268,000 acres in potatoes, yielding 38,408,000 bushels. The Fall sowing of rye covers about 271,600 acres, 8,400 less than last year.

BUFFALO MARKETS.

SEVERE weather from the middle of November has cut off the local produce supply somewhat, so that prices are going up slowly. Butter has declined slightly and poultry has failed to advance for the holidays, on account of heavy receipts. Cabbage is stronger and apples, potatoes and onions, the three weak points in the produce trade, are now steady, though no higher. Eggs remain strong. The cool weather has held the local grape crop in marketable condition. The last of the home crop sells at 35 cents per 20-pound basket for blue, and 40 cents for white, wholesale, with Catawba a little higher. The feature of the market is the quality of the apples offered. In this heart of the great apple district of the State there has always been occasion for complaint that a great part of the offerings at the retail markets has been of indifferent to inferior fruit, often unnamed. It is no doubt that the big influx of western apples has had much to do with the improvement of the local crop. Fancy Spys retail for 90 cents a bushel, ordinary quality 60. Wholesale prices, $3 a barrel down. Potatoes are not quoted above 47 cents, wholesale, retailing at 60. Onions are 40 to 70 cents wholesale, but the big Spanish ones retail at five cents apiece. Beans are very firm at $3.85 for best marrows. String beans are still plenty at 10 cents a quart, retail. There is some home-grown lettuce at five cents a head retail, but southern is arriving, the price being $4 to $6 a barrel. Cabbage is $2 to $3 per 100 and celery 30 to 40 cents per dozen bunches. Butter is quoted at 36 cents wholesale and the bulk of it is selling for about 35. The retail prices vary widely, what is called best creamery often being retailed at wholesale prices. Eggs still advance, the wholesale price for white fancy now touching 50 cents. Cheese is firm at 17 cents wholesale for fancy. Poultry came near being ruled out on account of the foot-and-mouth disease, but that now appears to be about under control, so that liberal receipts on poultry came in before Thanksgiving, wholesaling at 25 cents for dressed turkey, 21 for live, 18 cents for fancy fowl, dressed and 16 cents live. Ducks are 20 cents dressed, and 16 cents live. J. W. C.

Nov. 23. The past two weeks have been cold and dry. Corn more than half husked. The whole State of Ohio is quarantined on account of the foot-and-mouth disease; farmers cannot sell cattle, sheep or hogs, which makes it very inconvenient at this time of year. Potatoes a little lower, retailing at 75 cents per bushel. Apples all picked, selling at 25 to 40 cents per bushel. Pasture getting short. Wheat has made a fine start, selling at $1.10. Coal hauling mostly done; butter 22; eggs 36; chickens 12; turkeys 15. Very few public sales this Fall. Farmers are beginning to butcher.
Morgan Co., O. W. B. H.

WANTED—WORKING FARMER FOR FARM 150 ACRES near New York. Man of experience who has attended college preferred. Good opportunity. State age, experience and family. Address, FARMER, Box No. 2, R. N.-Y.

WHEN you write advertisers mention THE R. N.-Y. and you'll get a quick reply and a "square deal." See guarantee editorial page.

Subscribers' Exchange

Complying with several suggestions received recently, we open a department here to enable RURAL NEW-YORKER readers to supply each other's wants. If you want to buy or sell or exchange, make it known here. This Rate will be 5 Cents a word, payable in advance. The name and address must be counted as part of the advertisement. Copy must reach us not later than Friday to appear in the following week. No display type used, and only Farm Products, Help and Positions Wanted admitted. For subscribers only. Dealers, jobbers and general manufacturers' announcements not admitted here. Poultry, Eggs and other live stock advertisements will go under proper headings on other pages. Seed and Nursery advertisements will not be accepted for this column.

WANTED—A farmer's daughter, of character, for housework. J. O. HALE, Byfield, Mass.

SUPERINTENDENT or farm manager open for position; Agricultural College graduate; highest references; life experience. A. D., care R. N.-Y.

POSITION AS FARM MANAGER wanted by Feb. 15, 1915; practical experience, now taking Cornell course; age, 24. Address K., care R. N.-Y.

POULTRYMEN desiring services of single man of character, farm bred, but inexperienced in poultry at nominal wages. Address X, Rural New-Yorker.

POSITION WANTED—Estate superintendent, experienced, farm, garden, forestry, landscape, road building; references and bond given. D. J. P., care R. N.-Y.

PRACTICAL, intelligent man, married, experienced, wants responsible position on farm, about February or March; best of references. F. K., care of R. N.-Y.

WANTED—Elderly American woman, kind, efficient and trustworthy, to care for an aged lady; good home and pay. Address with reference, Box 2, North Germantown, N. Y.

YOUNG MAN—Understanding poultry, cows, fruit trees, gardening, will exchange services for board during winter; will go anywhere. RALPH C. PARISH, Upper Montclair, N. J.

WANTED—Position as working farm manager by married man; one who thoroughly understands all modern farm machinery, butter making, testing, feeding and raising of stock, all crops in rotation, free to go any time. L. P. V., 870 Holmes Road, Pittsfield, Mass.

WANTED—Working foreman, fifty-acre commercial fruit, dairy and poultry farm, also board one man; desirable location, good house, hard work with salary and share profit, or will rent; must fully understand fruit trees and have best references. Apply with full information and terms, ORCHARD FARM, Peekskill, N. Y.

ALFALFA HAY—F. P. ERKENBECK, Fayetteville, N. Y.

MAPLE COVE FARM—Products direct to Consumers. ROUTE 24, Athens, Pa.

PRAIRIE STATE INCUBATORS wanted; latest models only. MONTICELLO EGG FARM, Monticello, N. Y.

NEW HONEY—Basswood or clover in sixty-pound cans. Write for prices. C. A. HATCH, Richland Center, Wis.

THREE CARS second cutting Alfalfa; one choice. Two No. 1. IVYWILD ALFALFA FARM, Camillus, N. Y.

APPLES, APPLES, APPLES—For choice sprayed Winter Apples. Please order to-day. C. J. YODER, Grantsville, Md.

FOR SALE—Two Parsons low down milk wagons, used but short time. HENRY T. FAY, 236 Main Street, Poughkeepsie, N. Y.

28 INCUBATORS FOR SALE—All models, 260 and 360 eggs, in first-class condition; reasons for selling, am installing a Mammoth machine; write for prices. CHAS. R. STONE, Staatsburg, N. Y.

APPLES by parcels post, McIntosh and Greenings: 54 apples, about 1-3 bushel, $1.00; bushel box, $2; postage paid in first and second zones, which includes New York City. D. W. SOUTHARD, Gilboa, Schoharie Co., N. Y.

FOR SALE—Dairy Equipment; small bottling plant; bottle washer, sterilizing oven, can washer, bottler, wooden bottling cases and metal delivery cases. All in good condition. HENRY T. FAY, 236 Main Street, Poughkeepsie, N. Y.

GRAPEFRUIT AND ORANGES by express in half or whole boxes, F. O. B. Miami, Fla.; fancy brights at $1.75. Golden Russets at $1.50 per box, with order; delivered prices quoted on request. GEO. B. CELLON, Tropical Grove, Miami, Fla.

ONE DAVIS CAPPER AND FILLER, 2x6, price $300, cost $700; one De Laval Separator, No. 17, cost $105, has loose pulleys and hand power, price $50; one star Cooler, 19 tube, bye-pass system, so that brine and cold water can both be used at the same time, top and bottom milk containers, cost $200, price $60. All as good as new and in very good working order. CHAS. M. SELTZER, 2001 Green St., Philadelphia, Pa.

FLORIDA—Winter home, Maitland, Orange County, $666 cash, to settle estate; bargain. Write G. H. STRONG, Monticello, N. Y.

400-ACRE Rensselaer County Dairy Farm; modern equipped home, 20 farm buildings, 3 tenant houses. Owner, L. R. RICKERSON, Mechanicsville, N. Y.

FOR SALE—50 acres, stock, tools, just outside Rutland, good buildings, land, location, fine for poultry and gardening. HENRY DOYLE, Rutland, Vt., Route 1.

325 ACRES fine Steuben County fruit and dairy farm; will sacrifice this month for only $31 an acre, worth nearly double. Address OWNER, 41 E. Washington St., Hornell, N. Y.

21 ACRE, level, productive farm; nice buildings, only 500 feet from city line of Towanda; finest location in Bradford Co., Pa.; would make a desirable gentleman's place. J. A. JOCOY, Towanda, Pa.

FARM 147 acres, productive soil; well watered; good wood lot, handsome 15-room house; prosperous community; best of neighbors; near R. R., churches, schools and stores, $4,000. I. F. GEROW, New Paltz, Ulster Co., R. D. 1, N. Y.

FOR SALE—125 acres fertile sandy loam, 75 acres tillable, balance woodland and pasture land, rolling, well drained, suitable for all crops; good house, new barn, 36x70; running water, good orchard; one mile from High school, church and R. R.; chance to ship milk and raise fruit; $75 per acre. Address Towne & Fuller, Castile, N. Y.

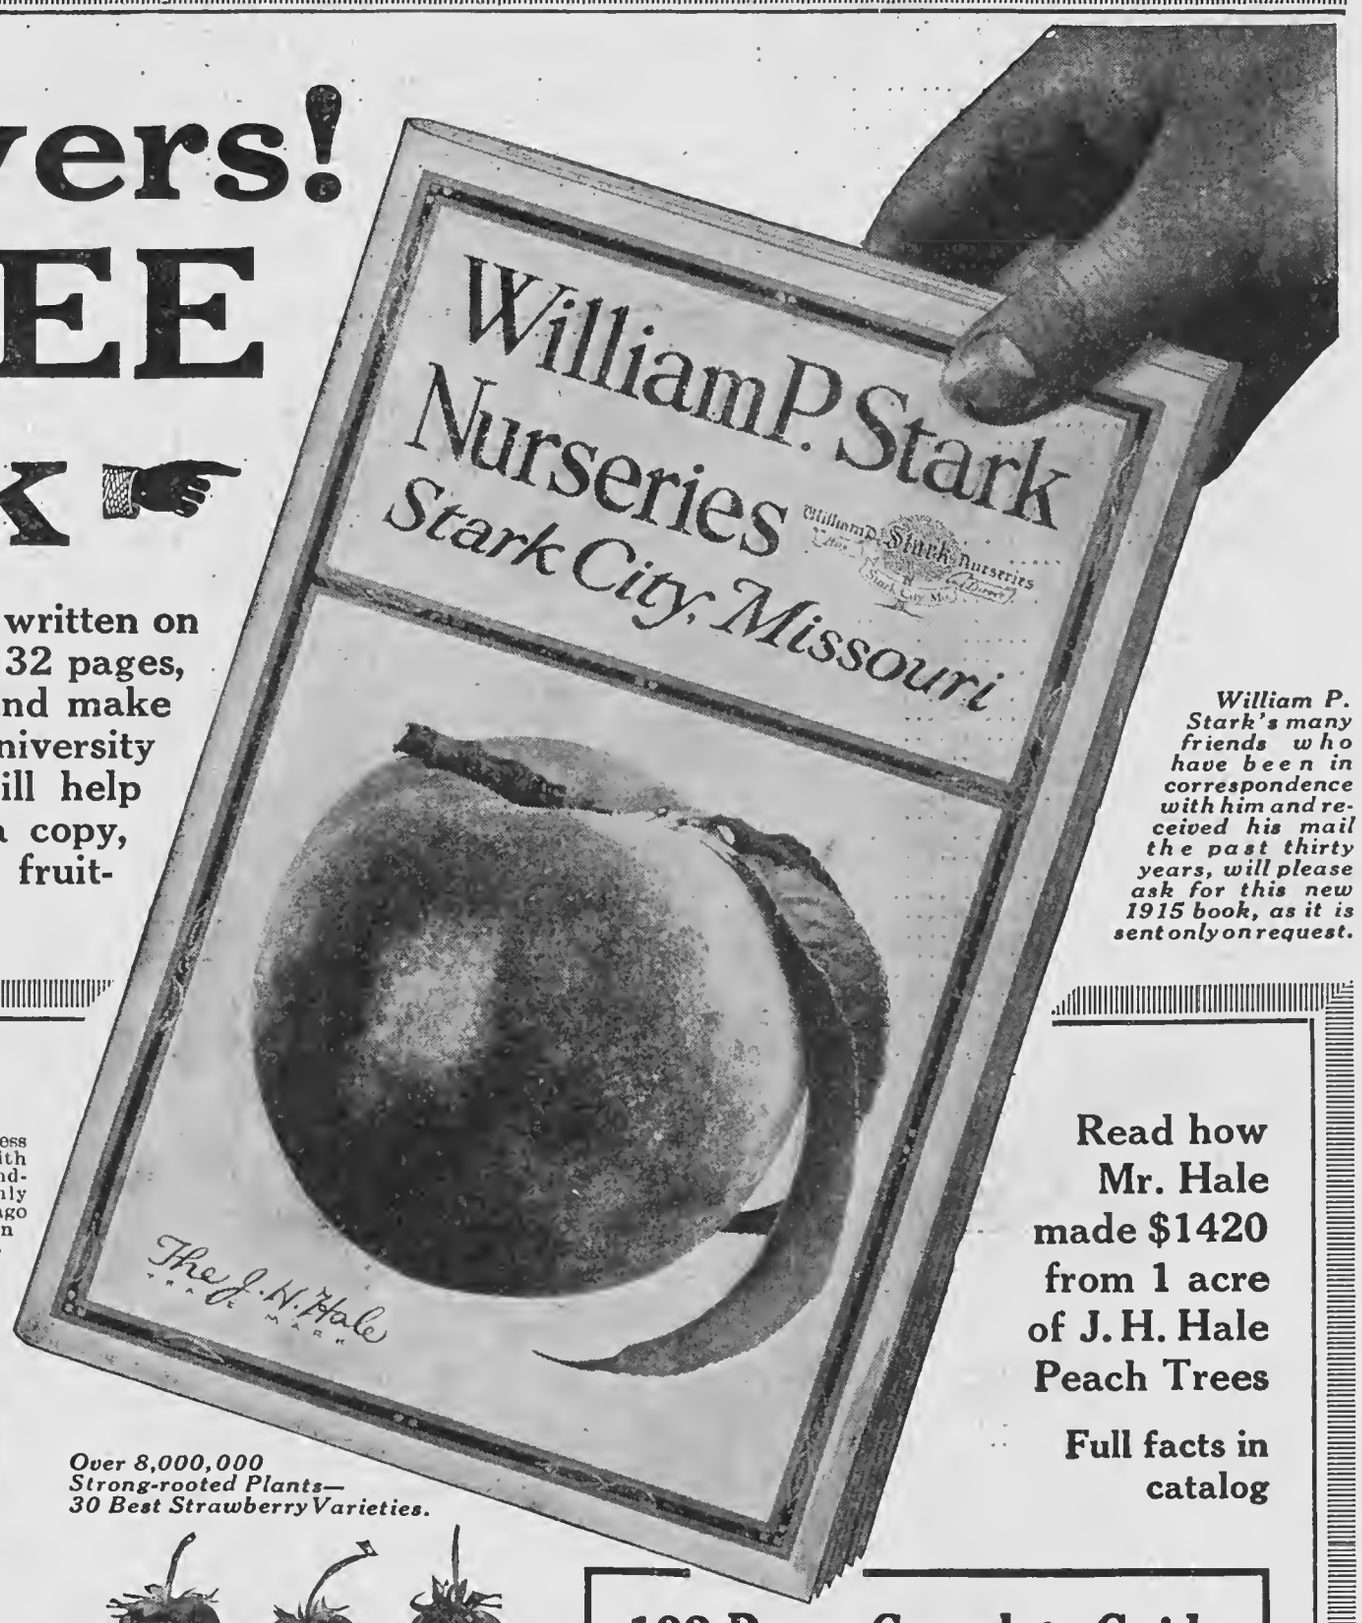
Fruit-Growers!

Write for the 1915 William P. Stark FREE

Tree Book

Cornell University Library 26214

Perhaps the most comprehensive hand-book ever written on high quality commercial and home-orchard fruits. 132 pages, with the very information you need to guide you and make your orchard a success. Used for reference in University courses of systematic pomology. A book that will help you *make* money and *save* money—worth 50c a copy, but mailed FREE to anyone truly interested in fruit-growing. Write for it today.



William P. Stark's many friends who have been in correspondence with him and received his mail the past thirty years, will please ask for this new 1915 book, as it is sent only on request.

J. H. Hale Million Dollar Peach

Averages ⅓ to ½ larger than Elberta; round shape; golden yellow, crimson blush; solid, firm as cling, yet perfect freestone; long keeper; greatest shipping peach known; fuzzless as an apricot; ideal canner; heavy, dense flesh for drying; ripens 5 days ahead of Elberta; brings 30 to 50% higher prices.

None Genuine Without Signature

Warning: Be on your guard against irresponsible persons offering worthless varieties as true J. H. Hale peach trees. Genuine J. H. Hale peach trees, budded from Mr. Hale's bearing orchards obtainable *only* from William P. Stark Nurseries, Stark City, Missouri.

PEACH J. H. Hale TRADE MARK Reg. U.S. Pat. Off. STARK CITY MO

Home-Grown Peaches for 3 Months

By planting early, medium and late ripening varieties you can enjoy luscious peaches from early summer until frost. Send for our peach-ripening guide, listing choicest peaches in order of ripening. There are handsome profits in commercial peach growing. Read Mr. Hale's story of how he made $1420 per acre—full account in catalog.

Apricots

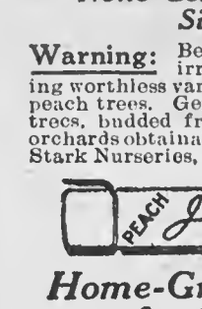
Delightful, rich, golden, sweet fruits. Wide adaptability. Hardy varieties—grow where even peaches fail.

Plums

Meaty, juicy varieties for canning, shipping, drying, jellies, marmalade and sauces. Very hardy. Thrive in all soils; in city yards, poultry pens—everywhere.

Cherries

"Sweet" and "Sour" varieties. Most profitable small fruit. Sought by canneries. Easiest to raise. Few trees on vacant lot yield big profit.



Grapes For Every State

Sixteen best tested varieties for all parts of U. S.: red, purple, black, white. Yield $100 to $200 per acre. Bear young. Also ideal for planting on arbors and fences.

Trees Like These Make Earliest Bearing Orchards.

Note the strong, sturdy growth of these 1 yr. old apple trees, illustrating the character of Wm. P. Stark Ozark-mountain grown trees. We can supply you special 4 to 6 ft. size 1 yr. apple trees at same cost of ordinary 3 to 5 ft. size trees. Our 2 yr. old trees are equally well developed. Get our money-saving prices.

Genuine Delicious—The Apple De Luxe

Exquisite flavor, delightful crispness and unique shape, conical tapering with five distinct knobs at blossom end. Tender, firm flesh overflowing with highly flavored juice. Sold last year on Chicago markets $1.00 to $1.25 more per box than other apples. Always brings highest prices regardless of what other varieties are selling for. Plant William P. Stark trees.

Apples For All Localities

Including: *Summer*, Livland Raspberry, Yellow Transparent, Wilson Red June, Duchess.

Fall, Wealthy, Red Astrachan, Gravenstein.

Early Winter, Jonathan, Grimes Golden, King David, Wagener.

Winter, Stayman Winesap, Baldwin, Banana, Black Ben, Rome Beauty, Winesap, Delicious, McIntosh, etc. See catalog.

Crabapples

Profitable. Enormously productive. Trees ornamental in bloom and fruit. Varieties for eating, canning and jellies.

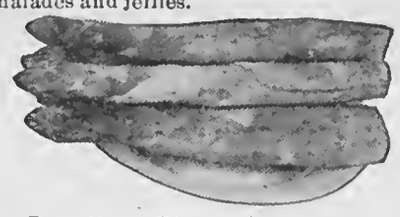
Pears

Most luscious, delicately flavored, juicy fruit grown. Market never half supplied. Early, medium and late varieties.

We also furnish some varieties on "DWARF" roots: plant 10 feet apart. Fruits same as on "Standard" trees. Pear trees thrive in sod; can be planted along avenues and corners of yards.

Quince

Easily grown. Great demand. Plant everywhere for flavoring preserves, marmalades and jellies.



Reading Giant Asparagus

One of easiest vegetables to grow. Comes every year from roots. Big money maker. Can your own asparagus. Special hybridized variety.

Over 8,000,000 Strong-rooted Plants—30 Best Strawberry Varieties.

Everbearing Strawberries

A commercial success. You can have fresh red strawberries—lots of them, from early in the spring until frost. Anybody can raise strawberries. They grow everywhere, on all well drained soils.

Blackberries and Raspberries

Grow everywhere. Yield as high as $250 per acre. A small patch a sure source of profit and a supply of rich fruit for home use.

Currants and Gooseberries

Sure croppers. Ship long distances. Keep well. Very dependable and productive.

Roses

Queen of flowers. Thirty kinds. Hardy Hybrid Perpetuals, Everbearing Teas, Climbers, all colors.

Shrubs and Hedge Plants

Hardy shrubs of every color for all purposes. Altheas, Deutzias, High Bush Cranberry, Hydrangeas, Snowballs, Spirea, Syringa, Snowberry, Japonica, Barberry, etc.

Nuts and Shade Trees

Permanent and fast growing trees for avenues, parks, yards and windbreaks. Chestnuts and Pecans.

Hardy Perennials and Vines

Many Peonies, Phlox, Iris—grand for cut flowers. All best vines for arbors, porches, walls.

Read how Mr. Hale made $1420 from 1 acre of J. H. Hale Peach Trees

Full facts in catalog

Why any one interested in farming should go

Here are four plain reasons why you ought to go to the Exposition at San Diego next year. Give them the careful consideration they deserve—everyone of these reasons is figured from your point of view.

The practical things you will see and learn—new ideas, new methods, new facts—if applied to your own operations will repay many times the comparatively low cost of the trip.

1—All kinds of the newest and most perfected farm machinery may be studied in the Exposition buildings, and in operation on the land.

2—There will be complete demonstration of "big" farming—carried out in actual work on a colossal scale; the newest efficiency methods that have made farming a big business will be visible in every detail.

3—For the smaller farmer there will be a perfect demonstration of intensive farming; the kind where very little land can be made to support a family comfortably. There is science in this; you'll see it at its best. Five acres with fruit trees, vegetable plants, vineyard, poultry yard—all producing.

4—And best of all, you'll get inspiration, "freshening up" if you need it, exhilaration. The things you see will send you back home with a new "punch" in your own work; there's no doubt about it. No matter how well you're doing you will learn things that will make your farming business better.

And there are hundreds of other reasons why you'll like to go—why you'll have the best time of your life. It's a wonderful Exposition; beautiful beyond any description; there are endless things contrived to entertain you, amuse you, thrill you with their charm and fascination. Railroads and hotels are going to meet you more than half way; it's not an expensive trip. Begin to plan for it soon; you will always be glad if you come.

Five hundred miles to the North lies San Francisco where during the greater part of 1915 will be held another Exposition, also celebrating the opening of the Panama Canal, the two supplementing each other.

When California celebrates, the Golden State's enthusiasm requires two outlets.

On up the coast and across the Rockies, in the deserts and forest, on the plains and in the valleys that fill the West, there are other sights which make all other lands commonplace

It is the Great West of the Grand Canyon, the Yosemite, the Yellowstone, the Painted Desert, the Great Trees. It is the West that you should see, and 1915 is the time for you to see it, when California with her two expositions offers you the opportunity and special rates.

Open January 1

See that your ticket in 1915 reads San Diego

"Oh! Espana, como mi joven, corazon por ti latia en tiempos pasados."—*Longfellow.*

Central New York Alive With It.

PART I.

AREAS IN THE CROP.—Five years ago the writer made a careful investigation of the methods by which Alfalfa was being grown in an annexed district of Syracuse which contained considerable farm land, and in several towns lying not far from that city. In following years these places were revisited, and many other fields were inspected. The results of these investigations were published in THE R. N.-Y. in April, 1910, and September, 1912. In September, 1914, the ground was gone over again, and many other and more distant fields were seen. The area of observation included more than a dozen towns and villages, and a good many of the prominent growers of Alfalfa within 20 miles of Syracuse were interviewed. Most of the growers interviewed are producing Alfalfa on a rather large scale and have had a good deal of experience with it. Quite a number cut from 30 to 60 acres each. A few, who lease part of the land, cut from 100 to 150 acres. Jairus Pierce, an Indian at the Onondaga Reservation, who is 79 years of age, has just seeded 13 acres to Alfalfa, and expects to cut about 30 acres next Summer. Nearly all the growers interviewed have cultivated this crop 15 years or more. Some have grown it from 20 to 25 years and one has been growing it more than 30 years.

SOIL AND LOCATION.—In this section Alfalfa makes itself very much at home. It prefers rather dry land but does well in moist places. It flourishes on hillsides, which are so steep as to make plowing and harvesting extremely difficult, and, if the water does not stand in them for any length of time, it does well in the low places of uneven fields. The plant will not live long in standing water, but it will grow to the extreme edge of a pool. Occasional overflowing does no harm unless it is quickly followed by a hard frost. Alfalfa does well in sunshine or in shade, in loose soils and in hard ground. J. S. Jerome is growing Alfalfa on land that was left idle for 50 years because it was too hard to be cultivated for grain. Naturally it is easier to get a good start, and the yield is larger, in fertile soil than it is on poor land.

PREPARATION.—On some points of Alfalfa culture growers have different opinions, but they are unanimous as to the vital importance of a thorough preparation of the land. The Summer fallow has been tried but little. Under ordinary conditions it is not to be recommended. Careful cultivation of preceding crops in order to free the land from weeds is the universal rule. The majority of the growers interviewed plow eight inches deep. One sometimes plows as deep as 10 inches. All take a great deal of pains in pulverizing the surface and making a fine seed bed.

SEEDING.—The most common method is to sow with oats in the Spring, but barley is sometimes used instead of oats and Alfalfa is occasionally sown on fields that were seeded to wheat the previous Fall. April is considered the best month for sowing Alfalfa. But little Fall seeding is done. The Fall sown seed will start well, but cannot be depended upon to produce a crop. Seeding with Alfalfa alone has not been tried extensively. Thus far the results have not been satisfactory, but two or three growers will test this method further. Sowing grain with Alfalfa tends to keep down weeds. If foul plants appear their growth is checked when the grain is harvested. The grain protects the Alfalfa plants while they are small and weak, and it also quickly returns a crop of considerable value. The cost of seeding with grain is but little greater than it is with Alfalfa alone. The only disadvantage of the practice is seen when the grain is so heavy as to interfere with the growth of the Alfalfa. This can be obviated by using only a moderate quantity of grain. This Summer W. A. Parsons substituted peas for oats when seeding a field to Alfalfa. The peas were cut and left on the ground for a mulch. The result of this experiment remains to be determined.

HOW IT IS DONE.—Alfalfa seeding is largely done with a grass seed attachment to a grain drill. Of the many growers interviewed one uses a wheelbarrow seeder, one broadcasts and does not cover the seed; and two broadcast and then roll lightly, but one of these will use a light harrow at the next sowing in order to give the seed more covering. Only a very few leave the seed uncovered. There is a wide variation in the quantity of seed that is sown. Two growers use only six quarts of Alfalfa seed with four quarts of Timothy per acre, and two others use 16 quarts of Alfalfa seed without Timothy. All seed with oats and all obtain good results. Those who sow Timothy claim that its mixture with Alfalfa makes a better feed for horses, that it will cover the ground if the Alfalfa fails in spots, and that it helps greatly in curing the hay. When grown with grain a fair quantity of seed appears to be eight quarts of Alfalfa and four quarts of Timothy per acre. After the grain is harvested the Alfalfa will make considerable growth, and there will probably be more or less weeds. Most growers leave these plants, but a few clip them rather late in the Fall, though they do not take them from the ground.

CUTTING AND CURING.—A few growers cut only two crops per year, but the great majority get three and a few, in favorable seasons, cut a fourth time. The first cutting is commenced when the plants are in blossom, usually from the first to the tenth of June, the second from the middle to the last of July, and the third according to the conditions of the crop and the weather. This year a large quantity was harvested in the second and third weeks in September. Very late cutting is liable to cause serious injury. Some growers cure the Alfalfa where it was left by the mower, others cure it partly in this way and partly in the windrow, while still others cure it in the cock. The first method admits the use of the tedder and loader and requires the least work. The last method involves the most work, and if caps are used the most expense, but it is considerable protection in bad weather, and it gives the hay a finer and more uniform color than either of the other processes. Several growers have changed their methods, but they have not all changed the same way. Judging from what could be seen in passing in various directions through a large tract of Alfalfa country not more than one-fourth of the total crop is cured in the cock.

YIELD AND PERMANENCE.—Like that of all other crops the yield of Alfalfa varies on different fields and in different seasons. The general range in this section is from three to five tons per acre, but in a good many instances a considerably larger yield has been secured. Under favorable conditions Alfalfa, which has made a good start gradually improves for several seasons. No decline is to be expected in less than eight years, and pretty good crops should be obtained for at least 15 years from the date of seeding. J. S. Jerome has a field that was seeded 14 years ago, and gave two good crops this year; C. D. Andrews has a field which was seeded at the same time which still gives good crops, and Hamlet Worker has a field which has grown 33 crops in 11 years, and the yield in the present year was as good as that in any which had preceded it, although the land had

GOOD ALFALFA ON A FARM IN SANGAMON COUNTY, ILLINOIS. FIG. 624.

received no manure or fertilizer during all this time. On some farms the system of crop rotation requires a considerable part of the Alfalfa land to be plowed once in 10 or 12 years. Plowing a newly-seeded field because its appearance is unsatisfactory is believed to be a mistake. In some cases the seed does not all germinate the first year, and it often requires two or three years for a seeding to become fully established.

WHAT BECOMES OF THE CROP.—Only a small fraction of the Alfalfa grown here can be used at home. Quite a quantity is sold as loose hay in Syracuse, but the bulk of the crop is baled and shipped to Boston, New York, and other points, from which it is distributed to the surrounding dairy regions. Bales range in weight from 100 to 200 pounds. Prices vary at different seasons, and in different years. At this writing loose hay brings $15 to $16, and baled hay $17 to $17.50 per ton. Growers who are in the dairy business feed Alfalfa to their cows. It is the best feed known for dairy cows. If carefully used it is excellent for horses, though occasionally one is found with which it does not agree. The first cutting is preferred for horses and the second and third for cows. Sheep thrive on Alfalfa. E. A. Martin says that all sheep need is Alfalfa and water. A few growers have fed Alfalfa to hogs and a good many have given it to hens. All report good results. There is a wide difference of opinion regarding the use of Alfalfa for pasture. Many growers have not tried it because they think it would be unprofitable. Some who have tried it have found it a decided injury. Others report that on dry ground, if the crop is not fed too close, pasturing does no harm. A few have Alfalfa pastures which are in use from May until October of each year. The animals thrive and the Alfalfa remains vigorous. The writer saw a field which has been pastured for 10 years, and is still in good condition. One grower suggests the division of the pasture into two fields, using them alternately for two weeks at a time. Pasturing Alfalfa on soft ground is to be avoided. Only a few of the men interviewed have tried Alfalfa in the silo. One reports favorably. Others have found it decidedly inferior to corn. The general sentiment is that as some dry food is always needed it is best to fill the silo with corn and feed the Alfalfa dry.

MANURE-LIME-COMMERCIAL FERTILIZER.—Of nine growers whose practice in this respect was learned seven sometimes manure their Alfalfa fields. One manures heavily and one lightly when the seed is sown, and the land is not manured again until it is plowed. Two top-dress lightly every year. One spreads on about 14 loads per acre every three or four years. One relies principally on what is used for the grain and Alfalfa at the time of seeding, but occasionally manures thin spots in the field. Two top-dress every two or three years and one applies a little manure before, but never after, the Alfalfa is three years old. Lime is seldom used on Alfalfa fields. There seems to be enough in the soil. Hamlet Worker, who manures only at the time of seeding, experimented with one ton of lime and 500 pounds of acid phosphate per acre. This was sown in strips and had no appreciable effect upon the Alfalfa or the oats with which it was seeded. He obtained a remarkably fine crop of corn on land that had been in Alfalfa for 10 years. There will be no lack of nitrogen, but it is possible that in time continuous cropping with Alfalfa will deplete the stores of phosphoric acid and potash. To determine whether the time of exhaustion of these elements is near the experiment with some form of fertilizer will be repeated at intervals. Only one instance was found in which lime had been used with marked benefit. In this the yield of a field which had been mowed three years and given only light crops was increased 50 per cent., by the application of two tons of lime per acre. Of three growers who have tested commercial fertilizers one drills in 200 to 250 pounds per acre when seeding, and thinks that it pays, one broadcasts a little when the plants are small, and one has found it useless. J. E. R.

PRACTICAL AGRICULTURAL COLLEGE MEN NEEDED.

"WILL it pay me to secure an agricultural college graduate as manager of my 200-acre New York farm?" a Chicago business man inquired. This business man had been studying the educational exhibits of the agricultural college at the dairy show. "I have studied the matter considerably," he said, "and these are my views. If they are sensible I want your opinion. In mercantile business of some size I have been in touch with classical college men. I will apply the same acid test to agricultural college men on the farm. I do not want a young man who stands at the head of his class. I do not want a young man who is able to complete his agricultural course without financial hardship. I want a young man who has worked for at least part of his agricultural education. I want him to be a young fellow whose father opposed rather than supported his college work. I do not want a fraternity or a society man. Not because I oppose either, but the young man who has unlimited parental support, who goes in for society and for 'frats' will be the fellow who has too big ideas for me. I want my farm to pay its way. That is business. I find that too many young fellows have big ideas when they get out of school. They intend to become rich or prominent suddenly, and they fizzle out. I know one young man who told his classmates at the agricultural college that he intended going back to the farm to do things. He plunged the farm hopelessly in debt before he shelved his high ideas for more practical ones.

"I would be glad to secure a man past 30. My ideal would be a man who had worked out part of his time, one who had attended the agricultural college perhaps a year, then went back on a farm and worked a year or two, and then returned to college. When his funds would become exhausted, he would then go back to the farm, go to testing cows or engage in some practical agricultural work. I would rather have a man who attended the short course each year and worked the remainder of the year on his father's farm, than have the young man who had continued his course without interruption and without hardship. I would rather have taken the young man who hopelessly mortgaged his farm, after he had been to college one semester, than have him the day he graduated. Now, after he has some of the impractical ideas knocked out of him, he might become a valuable farm manager. I want a young man with executive ability. If he has been a renter for a year or so, or managed the home farm conservatively and progressively, he fills my ideal in that direction. It should not be difficult to secure a man of this sort, and possibly my man may not be an agricultural college student, but some young man on a rented farm. In any event the star athlete, the society and fraternity man and the most brilliant student will find opportunities in teaching and demonstration work. Somewhere they tell of the stone the builders rejected which was placed as the headstone of the corner, and he is the fellow some of us want." W. J.

AM I A "RETAIL MILK DEALER?"

I LIVE in an "incorporated village" of about 1,400 inhabitants. We have two milkmen who furnish the people with the "black-and-white" milk, peddling once a day. I have one cow, mixed Guernsey and Jersey, and sell milk to some half dozen of my neighbors, they coming after the milk and paying the same price they would have to pay for the milkman's milk delivered at their door. There are some others who do the same, and some who deliver the milk to their customers. The milkman told me the other day that I must either stop selling milk or take out a license, bottle and label my milk, and have a bacterial test made of it. I want to know if this is true. Must all the little one-cow men go out of business, send their neighbors to the milkman, whose milk they do not like, and many times can't keep for breakfast next morning, or go into all the expense and red tape mentioned? Hasn't a person in our boasted free country a right to sell, or offer for sale, a quart of milk, a jar of butter, a dozen eggs, a chicken, or anything out of his orchard or garden, without taking out a license or going contrary to the law? If not it is high time the women took hold of the voting, for they could certainly do better than that. H. F. K.

Whether or not you are a retail milk dealer, within the meaning of the new sanitary code of New York State, depends not so much upon the number of cows that you keep as upon your purpose in keeping those cows and the disposition that you regularly make of your milk. A strict interpretation of the language of the law would forbid one to sell even a pint of milk to a neighbor without having first taken out a permit from the local health authorities. As the purpose of those who framed the code was not to prevent such neighborly accommodation, however, several "rulings, interpretations and explanations" have been issued by the Commissioner of Health for the purpose of making clear just what the Department is trying to accomplish in the matter.

As you state your own case, you do not come within the provisions of the new law. It is intended that this law shall apply to bona fide milk dealers only, and I think that "dealer" may here be fairly defined as one who produces, or purchases, milk and disposes of it at retail primarily for the business profit in the transaction and the income which it produces. There are other people who produce milk primarily for their own family use, but who, having a surplus above their needs, dispose of this to their neighbors. The number of cows kept or the amount of milk disposed of have less to do with the status of the dealer than the real purpose for which cows are kept. The Commissioner of Health has ruled that "A man with three cows of his own who sells to a few friends, in their own pails, the surplus over his own needs is not a dealer." As few families could use the product of three ordinarily good cows, it would seem evident that one or more of such a number of cows must be kept for the purpose of supplying others; nevertheless, this is the ruling and it serves the purpose, at least, of showing the Commissioner's attitude toward the law. On the other hand, another ruling is that "A farmer who carries milk to a creamery but also sells at retail along the way is a dealer and requires a permit."

The distinction seems to be that in one case milk is produced primarily for family consumption, as vegetables are raised in the garden, but to avoid waste, the surplus is retailed to neighbors, just as a few surplus vegetables might be sold; in the other, milk is produced as a business proposition and its sale serves as one of the chief sources, if not the chief source, of business income.

It must be admitted that there is a fine distinction here that it is difficult to put into words that are not open to contravention; the distinction exists, however, and it is the duty of health officers to apply it to individual cases with the judgment that comes from a knowledge of the circumstances that surround each case. Much is necessarily left to the discretion of health officers, and it may be said for the Department that it is desirous that the law shall be administered in a spirit of fairness and liberality rather than in one of subservience to technicalities.

The law does not require bottling of milk or a bacterial test unless it is sold as "Certified" or "Grade A." The containers of all milk offered for sale must be tagged, however, and in the case of dipped milk the tag showing its grade may be attached to the can, or other receptacle, in which it is kept. For the present, milk will be sold largely under "Grade C," but it is probably the intention of the Department ultimately to abolish this grade and enforce observance of the stricter requirements involved in the higher grades. M. B. D.

POTASH FROM IRON SLAG.

I AM inclosing clipping from the Boston "Transcript" for your comments. I don't quite understand how so large a quantity of potash as will be required to turn out 500 tons of fertilizer a day could have remained undiscovered so long.

"Pittsburg, Pa., Nov. 13 (Special)—The shutting off of the supply of potash from Germany by reason of the European war has resulted in the establishment here of a fertilizer company, capitalized at $1,000,000. About 150 men will be employed in the beginning. The company has a patented process for the manufacture of commercial potash. It will be an important factor in the Pittsburgh district inasmuch as it will use thousands of tons of slag from the steel mills. This slag is ground and mixed with Tennessee phosphate rock and becomes effective and immediately available for fertilizer. The company owns over 500 acres of phosphate rock in Tennessee and will manufacture 500 tons of fertilizer a day." H. W. B.

You may safely discount most of the (special) news items you read in the papers. There are a good many ways of printing concealed advertisements. This year the best trick in the fertilizer business is to talk in some mysterious way about a new source of potash. It is well known that the German mines provide all the available potash now cheap enough to use as fertilizers, but anyone who can make farmers think he has some new supply will stand a chance to reap a harvest!

Chemists know that certain steel interests have a waste product containing small crystals of apatite. This is a hard mineral containing phosphate of lime. Van Slyke says it is probably the original source of phosphorus in all other phosphoric compounds. It is too hard to be of much use in making fertilizers. It is not likely that there is enough potash in this slag from the steel works to amount to much. There are various methods for treating silicates of potash (rocks) so as to make part of this potash available. Our guess is that this fertilizer company is handling this slag and ground rock in some way to make the phosphoric acid more available and simply talking about the potash in order to attract attention to their business!

The goods sold by this concern last year were what they called "experimental" and known as "phosphatic lime." There was very little available phosphate in these goods. Their goods this year contain more available phosphoric acid, but the chemists have not yet determined how it is obtained. Samples collected last Spring showed only from six to 10 pounds of potash to the ton. This did not show that they were making the potash in the slag available. It strengthens our suggestion that they are making available phosphoric acid and *talking about potash* in order to sell their goods. We are as eager as anyone can be to find sources of American potash, but when they come with these "patent" methods they must "show us."

THE hens often suffer at this season. As they do not lay the hen man concludes they should not be fed. They need food more than ever now. "He that will not work neither shall he eat" does not apply to the molting hen.

A 286-EGG HEN.

Record Made at the Thorndale, Pa., Contest.

THE picture at Fig. 625 shows a remarkable hen known as Columbian Queen. This hen, a Columbian Plymouth Rock, had a record at the last Thorndale egg contest of 286 eggs in one year. There is no question about this, and we reprodnce at Fig. 626 an engraving of the record which shows just when each egg was laid. This is a form sent out by the managers of the egg-laying contest, and from it the date of each egg laid duriug the year can be noted. A study of this record will show what a remarkable performance this Columbian Queen gave. Surely there were very few lazy days, but she shelled out the eggs consistently. Those who are interested in such matters may figure out the income from this hen. It would be fair to say that in a near-by high-class market, eggs laid from November 1 to Febrnary 1 average 50 cents per dozen. From February 1 to May 1, it would be fair to make an average of 36 cents per dozeu, and our readers will agree that 30 cents per dozen for the remaining months wonld have been a very conservative estimate. On this basis Columbian Qneen produced eggs which, if sold for eating pnrposes on the regular market, would have brought $8.72. Surely this hen had a remarkable earning capacity, but she is worth very much more for breeding purposes. This record was in no respect an accident. Mr. J. M. Jones of Monmouth County, New Jersey, who bred this bird, says that the mother of Columbian Queen was a hen that laid 225 or 229 eggs in one year. He had three hens; one of them laid 225 eggs and the other two each 229. These three birds were bred from a cockerel of the same strain, but his mother had no certified egg record, although she was a good bird. Two of the brothers of Columbian Queen have won first prize at poultry shows, and so it will be seen that this family is full of eggs, and from the breeding of this bird, about all she would be expected to do when given plenty of food would be to shell out eggs. In fact the record of this hen was backed up so thoroughly by pedigree that Mr. Jones was offered $500 for the hen. This shows what is surely coming in the pedigree hen business. After a few generations of selecting and careful testing there will be a demand for these worker hens corresponding to that for cattle with sure performance in their pedigree. Of course there are those who still sneer at the egg contests. Let them keep on sneering—the utility pedigree hen is coming as sure as fate. That, as the boys say, is "some sure!"

EGG CONTEST RECORD OF COLUMBIAN QUEEN. FIG. 626.

THE FARM MANAGER QUESTION.

YOUR bringing up of the owner-manager problem in the editorial columns on page 1344 leads me to give some ideas on the question derived from personal experience. First of all, it is presumed that the city man farmer is in possession of the record and experience of the prospective "manager" as well as his own estimate of the latter's latent ability. If satisfied thus far he should be willing to pay to begin with just what he would to a superintendent or manager of any non-agricultural business, i. e., compensation on the basis of work done in the same or relative capacity elsewhere. In agricultural work this would certainly mean at the local rate of hired man's wages plus comfortable home qnarters and products of the farm for home use in return for the responsibility assumed. If the prospective manager has been especially successful elsewhere, or brings exceptional experience with his personality, he is entitled to additional compensation to be agreed upon, as in any other business where proved ability is bought and sold.

It is right that the city-man farmer should take all the first year's "risks," as no new superintendent is responsible for work done or undone by a predecessor: such as condition of orchards, amount and condition of grass lands, area in Winter grain, etc., upon which success for the succeeding year so largely depends. Thus it would seem fair to assure the prospective manager of a living wage plus a bonus for proved ability for his first year's endeavors at least. This the city-man farmer may pay at a loss, but it is what he must pay for his own inability or lack of opportunity to fill the job himself.

Now, after the manager has had the chance to "learn" the farm—state of cultivation of the farm, what the cows and other stock are good for, the varieties in and condition of the orchard, the labor situation, and above all, after he has learned his "boss," whether he be a man with a hobby who must be humored, a man decided in his own views about farming it, whether the women members of his household are critically observant of operations and conditions they know little of—then, after this experience, he may in fairness be asked about taking any "risk" with the owner. The city-man farmer has, meanwhile, had the chance to let his man go to some other job if the work did not please him.

COLUMBIAN PLYMOUTH ROCKS AT THORNDALE EGG LAYING CONTEST. FIG. 627.

If, at this time, the matter of "sharing the risks" be brought up the question of expenses to be charged against gross profit is always a nut to crack. Perhaps the farm is capitalized beyond its agricultural value, and interest on an investment no professional farmer would have made must be deducted. Perhaps the show part of the city-man farmer's business has been heavily emphasized. Perhaps pure-bred stock has been held onto because of blood rather than milking qualities. These and many other probabilities may confront a willingness at first thought to share the responsibilities of too big a financial burden.

True, no sound business man buys as an investment pure and simple at present-day prices, a well-situated productive farm which must be managed by some one other than himself, for there are innumerable opportunities for investment not so dependent on the caprices of Nature for their return. So it is either ignorance of the realities of farming, the satisfaction of a hobby, or the natural desire to own a farm, that makes it necessary for the city-man farmer to consider the services of a manager at all. Why, then, should not the city-man farmer take full consequences be they at a profit or a loss? He still holds the option of keeping or firing his manager. Why isn't a good salesman, or a floor manager or an editor asked to "risk" his value in another man's proprietorship? Why ask a farm manager who has double the uncertainties of any other business to contend with—why ask him to take chances by guaranteeing that he can make wages and a profit from another man's business plant? Let the city-man farmer get and pay for ability as elsewhere. If his farm plant won't, for elemental reasons, pay for responsibility and work done by a manager, and a profit for himself, the alternatives are sell out or pay the fiddler!

Massachusetts. ALLEN B. DOGGETT, JR.

R. N.-Y.—Both parties in a farm working proposition must "give and take" until the job settles down to a fair basis of equality. It is a bad thing for either partner to have the best of the bargain as this makes disatisfaction all around.

SEEDSMAN RESPONSIBLE.

"WHAT should the seedsman do? Get behind his non-warranty clause or pay fair damages?" THE R. N.-Y. asks, after citing an instance where, under peculiarly exasperating circumstances, a seedsman was found to have supplied Alsike and clover seed instead of Alfalfa seed, causing damage and loss to the purchaser by the substitution.

I have been the victim of misplaced confidence in nurserymen in the matter of trees, but have never had any serious disappointments with seeds—nothing of great moment. If I should, however, have such experience as was related in THE R. N.-Y. and to which I have referred, I would expect the seedsman to make good, and I believe in such a case I would be justified in insisting on it. Arbitrarily laying down a non-warranty condition does not cover the matter of substitution, and cannot equitably do so. A seedsman might not properly be held accountable for crop failure, because there are so many factors and contingencies. It would not be just to place the burden for failure in that respect upon him. But in the matter of substitution, the responsibility rests upon him, irrespective of whether the substitution is by accident or design. We may charitably assume that it is wholly accidental, without altering the equity in the matter at all.

Making a hypothetical application of the same principle elsewhere we shall be able to see this clearly enough. Suppose, for instance, this seedsman should conclude to go into the business of canning pumpkin. Suppose he should buy from the near-by farmers several carloads of what were supposed to be and were represented to be and were sold for pumpkins, and he should go on with his canning operations only to find that his factory had had worthless gourds furnished it instead of pumpkins, as agreed and paid for, and his product was worthless. Clearly, he would have a perfectly just case for damages against those who had made the substitution of gourds for pumpkins, irrespective of whether the substitution was by accident or design. The customary business theeory of "caveat emptor"—let the buyer beware—would not, I think, or should not hold. Doubtless any court or jury, in awarding damages, would be favorably influenced to some degree in the defendant's favor if it could be clearly shown that the substitution was accidental, but as a simple matter of justice, whatever the legal aspect might be, I cer-

tainly believe the seedsman is responsible, and should be so held, and that he should be made to pay suitable and proper damages. ROBERT S. DOUBLEDAY.

R. N.-Y.—The case of pumpkins and gourds will not hold on the case referred to. The farmer had a good locality. He wanted Alfalfa and spent money freely to get it. Yet it is not sure that Alfalfa will succeed on his farm. There is where the trouble of fixing any damages will come in.

NEW YORK STATE NEWS.

CO-OPERATIVE SOCIETY ORGANIZED.—Under the auspices of Gonverneur Grange a coöperative society has been organized under the State law and will be incorporated soon. Wilber A. Whiting is president and W. H. Storie, secretary. The county deputy of St. Lawrence County now reports a Grange membership in that county of 5,500.

HOBART DAIRYMEN.—The Hobart branch of the Dairymens' League held its annual meeting Nov. 28 and elected Hector W. Cowan president and A. M. Mihalko, secretary. The report of the secretary shows that the farmers of that vicinity have profited greatly by the organization.

CONVICTS WITHDRAWN.—It appears that the working of convicts on the Palenville-Clove highways near Catskill has not been a notable success. It is said that their inability to stand hard work has delayed the construction very much, and their presence has been a constant source of fear to the nearby residents.

HOP GROWERS DISCOURAGED.—It is likely that more hop fields will be plowed up next Spring than ever. The growers are getting discouraged with all the diseases they have to contend with in growing a crop, and the weather was also against them the past season. One hailstorm is said to have destroyed hundreds of acres of hops in Oneida County. The hop men have also been sadly disappointed as to prices. It was thought when the European War broke out that the prices of hops would go up, but that has not been the case, and those who held their crops for 50 cents now find a slow market at 25. The crop on the Pacific coast has been a large one, and with the machinery there used in the harvesting the crop the price is not more than 10 cents a pound. The increased cost of labor here has also made the business less profitable, pickers now receiving from 50 to 60 cents per box instead of 30 to 40 as in the past. This year's crop at Otsego County is said to be the lightest since 1886, when the crop was badly injured by lice.

MORE QUARANTINE.—There was an outbreak of the foot-and-mouth disease in Tompkins County, last week. The towns of Groton, Dryden, and Lansing in Tompkins County; Homer and Cortlandville in Cortland County and Summer Hill and Locke in Cayuga County have been quarantined.

BALED HAY MUST BE MARKED.—A ruling which will interest many farmers was made last week by the State Sealer of Weights and Measures upon an inquiry of a county sealer. It is to the effect that the full name and business address of the presser of the hay must be plainly marked on the weight tag on each bale. The owner and operator of the hay press is responsible for the marking. Every violation of this law is subject to a fine of $5, but if hay is offered for sale on which the correct gross weight is not plainly marked, or which weighs more than five pounds less than the gross weight so marked, the violator is guilty of a misdemeanor.

POWDERY SCAB.—The New York State Shippers' Association has received a report from the Federal inspector sent to Western New York to make examination of potatoes to the effect that there was no trace of scab in that territory. He inspected potato warehouses and cellars in six counties. The association also is said to have had reports from the State Department of Agriculture to the effect that no powdery scab has been found in the State outside Franklin and Clinton Counties. Western New York is estimated to have about 35,000,000 bushels of potatoes this year.

STAMP BILLS LADING.—On Dec. 1 the war tax law went into effect for the purpose of increasing the internal revenue receipts. All shippers are now required to put a one cent stamp on all bills of lading, whether for a carload or a single package. The penalty for not conforming to the law is $50 for each offense.

HERKIMER CO. FARM BUREAU.—At the recent annual meeting of the Herkimer County Farm Bureau the executive committee announced that Chas. A. Taylor of Hancock, Delaware County, would succeed M. E. Chubbuck, who has become manager of the Chemung County Bureau. Mr. Taylor has been at the head of the Hancock High School for three years and has had considerable experience in practical farming. John M. Budlong of Schuyler succeeded W. E. Kay of Herkimer as president of the Farm Bureau Association. Mr. Kay represents the Pomona Grange on the board and James Thompson of Fairfield represents the Board of Supervisors.

J. W. D.

Fertilizer for Melons.

LAST season I failed to make a compost heap for melons, and as a substitute for same used in the hills a fertilizer mixture—3% nitrogen, 8% phosphoric acid and 8% sulphate of potash, which was very highly recommended by our State Experiment Station. I followed their instructions strictly as to its use, but the result was a complete failure of the five acres of melons planted. The fertilizer seemed to destroy, or at least prevented, the seed from germinating. I still have on hand several hundred pounds of this mixture, and while I would not think of using it again directly in the hills, I have thought possibly I could use it with good results by distributing or mixing with the compost heap I am now preparing for next season. Will you advise me as to same? I have been so badly burned this past season with this fertilizer I have no desire to take any more chances on it.

Charlestown, W. Va. G. E. W.

Muskmelons are grown on a large scale. The common practice is to prepare the land in the Fall, and in January or February run out deep furrows five feet apart and fill these half full of stable manure. This is let lie to rot till planting time, and then a fertilizer running 7% ammonia, 6% phosphoric acid and 5% potash is applied on the manure and at rate of 300 to 400 pounds an acre. A furrow is thrown over from each side, and the ridge thus made slightly flattened and the seed sown in continuous row with a garden seed drill. When a stand is secure the plants are thinned to 18 or 20 inches, and just as they start to run about a tablespoonful of nitrate of soda is scattered around each hill. If you planted the seed in direct contact with the fertilizer you used, the caustic nature of the sulphate of potash doubtless did harm. The fertilizer you name is somewhat strong in potash for melons, and I would prefer to have the nitrogen higher and the phosphoric acid all the same, or eight per cent. In fact I think that five per cent. potash is more than melons need. You can use your fertilizer 100 pounds to each ton of stable manure well mixed and then have the compost well covered before planting the seed. W. F. MASSEY.

MAIL BAG.

Muck or Mud.

I WOULD like to haul out some muck this Winter; I have also a shallow lake on the farm. Which do you prefer, the muck or the mud? Also advise me how to handle it. M. K.

Coolbaugh, Pa.

By analysis the muck is worth more than the mud. The mud may contain more *available* plant food, since it represents deposits from the water. A mixture of the two would work well—put in long, narrow piles and well dusted with lime as the piles are made up. Use about 50 pounds of lime to the load.

Value of Mangels.

WILL you give me a fair price for mangel beets, raised in this locality? What price should I obtain for same by the ton? G. P. M.

Plainfield, N. J.

It depends upon supply and demand. For lots of 100 pounds we obtain 75 cents or $9 per ton. In dairy districts the roots bring $6 to $7.50. Where a limited quantity is wanted for hen food the price usually runs at the rate of $12 to $15 per ton.

Lime With Cover Crops.

I HAVE purchased a farm on which is a piece of run-out meadow land. I wish to plow this in the Spring and sow to oats and Canada peas to be turned under green; then seed to buckwheat to be plowed under also, and seed to rye in the Fall. Next Spring (1916) I shall plow under the rye and plant to corn or potatoes. I wish to apply lime to this land. Would it better be applied with the oats and peas, or put on with each crop to be turned under. J. B. A.

Oil City, Pa.

We should use a heavy application of lime when turning under the sod and sowing the oats and peas. This crop can make better use of the lime than either the rye or buckwheat, and it would not pay to make two or three applications. By following this plan you will stuff that soil with organic matter.

Filter in Cistern.

I HAVE a cistern at my barn 10 feet in diameter, eight feet deep, which I wish to pipe to the house. How can I filter it so the water will be suitable for household use (not for drinking or cooking)? How is a brick filter put in? A. E. S.

A filter of brick for a cistern is usually a simple brick wall built across the cistern in such a way as to divide it into two parts, the water running into one side and being taken from the other after it has passed through the bricks. Another method of filtering cistern water is to construct a concrete reservoir of suitable size and fill it with gravel, pulverized charcoal and fine sand in three layers. The water passes through these layers in the order named and is received into a clean chamber from which it is pumped. This filter may be built as part of the cistern or outside, as convenience dictates. As you wish water only for washing purposes, any simple method by which it could be made to pass through a layer of gravel and one of sand would probably be satisfactory; in fact, if the barn cistern is a well protected and clean one, I do not see why the water should not be used directly from it. M. B. D.

Gunning for Woodchucks.

ON page 1392 you advise H. L. to fire a heavily loaded gun into a woodchuck hole as one of the methods to destroy woodchuck. A neighbor of mine did that very thing a few years ago. He lived to tell the tale, and buy a new gun, but he won't try it again. There is but small chance for the gas to expand when a gun is fired in a place like a woodchuck hole, so a burst gun barrel is quite liable to be the result. R. C. G.

R. N.-Y.—Of course we did not intend that the gun should be pushed down into the sand and then fired—but pointed into the hole.

Which System Best?

REGARDING the proposition of an agricultural college graduate to undertake the management of a farm at a salary of $300 per year, board and one-half the profits (net profits?) compare with a common form of contract for tenant farming, viz. the landlord furnishes land and buildings, including house for tenant, and pays for one-half of fertilizers purchased and one-half of foundation stock, if stock farming is practiced. The tenant furnishes all labor, tools and machinery, teams, etc., and pays for half the fertilizers and stock aforementioned. The gross profits are divided half and half. Which would prove the more profitable to the land owner, assuming the tenant and graduate to be both excellent men in their line of work? C. H. CHAPMAN.

New York.

R. N.-Y.—This is a question for general discussion, as there are many sides to it.

Bees and Fruit.

I JUDGE from Mr. Weed's article, page 1360, that he does not like bees. Prof. Waugh, who experimented as a fruit-grower and not as a bee-keeper, proved that bees, as pollenizers, were more reliable and much superior to the wind. He placed panes of glass, covered, I believe, with a viscid fluid, among his trees, in order to catch the wind-blown pollen. As I recall it, the amount so caught was surprisingly insignificant. He also noted that honey-bees were the chief agents of fertilization. I believe that Mr. Weed is very much indebted to the bees for the good crops obtained in the past, and especially for the 10½ tons of cherries mentioned. I think he is mistaken in his figures when he estimates that there were a dozen flies and other insects for each flower, and perhaps less than 500 bees among the 1½ acres of cherry blossoms last Spring. But assuming that he is correct, that does not prove the bee a negligible factor in the perfect pollination. Excellent honey-gatherers (which means good pollenizers) often fill their supers in a quiet, methodical manner that borders on the miraculous. In this locality the bees held high carnival during fruit bloom, and gathered but little surplus after that. After I became a bee-keeper in 1900, a neighbor, who is a close observer, voluntarily told me that he was securing better crops of apples because I had located near him. Since then the testimony of fruit-growers themselves has led me to regard bee-keepers as public benefactors.

Connecticut. JAMES A. SMITH.

Nov. 27. Conditions in this section of Nebraska are unchanged. People are preparing for Winter, but there is no sign that Winter is near. The weather has been dry and warm during November, no storms of any kind for more than a month. Really a good rain is needed before Winter comes. Wheat is looking well as usual. Corn is nearly all in crib and much of it shelled. The price is 60 cents. There are a few farm sales, but not the usual number, as property is not bringing satisfactory prices at auction. Prices of young cattle are on a basis of 6 to 6½ cents a pound; cows are still selling at $50 to $75. Horses are lower than for some time, although there is a brisk demand for a class of medium-weight animals for the British army at $75 to $100. Land sales are too few to mention. Prices of land have not fallen off, but sales have. Prices of produce are: Wheat 98; did reach $1 at one time for part of a day. Corn 60; oats 40; potatoes 65 to 80. Apples 60 to 75 as to variety. Hogs around $6.50 per hundred; eggs 25; butter 25.

Jefferson Co., Nebr. H. M. R.

THIS WONDERFUL COLUMBIA PHONOGRAPH
On Ten Days' FREE Trial

The Columbia is the greatest of all funmakers, the king of entertainers, the most fascinating musical instrument the world has ever known. Listen to your favorite waltz, two-step. You have a vaudeville show, a grand opera, or the sacred hymn you like. Every kind of comic and popular music can be heard on this wonderful machine. We send you the machine, together with the selection of records on ten days' trial. You are under no obligation to buy, simply try the machine in your own home. If you find it the most wonderful entertainer you ever saw or knew about, and desire to keep it, you can pay for it all cash or on very easy terms. Send your name and address for further information.

CONSOLIDATED TALKING MACHINE CO.,
50 Church St., New York City.

Strawberries—the big delicious kinds, that bring highest prices—can be grown in your own garden by using our plants. Vigorous—guaranteed true-to-name. **Allen's 1915 Book of Berries** fully describes the latest and best varieties of strawberries and other small fruits, giving cultural methods, etc.—the result of 30 years experience. It's free. Write for copy today

NATIONAL FIRE PROOFING COMPANY, Fulton Building, PITTSBURGH, PA.

Grafting the Hickory.

CAN you give any information on the propagation of the hickory? There is a hickory in this neighborhood that bears a nut much larger than any other in the vicinity. I have done a good deal of grafting apples, and have successfully budded the peach, but have not been successful with the hickory. I would like to propagate a few trees from this desirable tree. L. H. P.
Ludlow Center, Mass.

This method of grafting the hickory is comparatively simple. Cut terminal twigs in February for scions. Keep them lying on a bed of dry leaves, and covered with the leaves, on the dirt floor of a cold cellar. For stocks, any variety of hickory will do, shagbark, shellbark, pignut, bull nut or pecan. Use stocks from two to six inches in diameter. When the leaves on the stocks are two or three inches long cut the stocks off squarely with a saw, breast high on any point desired. Then cut the scions with a long sloping cut on one side only. Insert the point of this one-sided wedge between the wood and bark of the stock, cut surface of scion toward center of stock, loosening the bark a little at the start if necessary with a knife, and push the scion down the length of its cut surface. Now cover all cut surfaces with grafting wax and tie a paper bag over the whole operation. Scions cut to two buds, one of which is the terminal bud, give good results. After 10 days a peep hole may be made in the bag and the scion watched. As it grows the bag may be torn open as neccessary. The young shoot should soon be tied to some support to prevent breaking off by accident. This method, here barely outlined, has given excellent results. WM. C. DEMING.
Sec'y Northern Nut Growers' Assn.

Sudan Grass.

JUST now there is much talk about Sudan grass—the new fodder crop. The Department of Agriculture recommends it highly for the Southwest, but is doubtful as to its value along the Atlantic coast. The grass appears to be some distant relative of Johnson grass or quack grass, but has no such propensity for spreading underground as these pests indulge. The Sudan grass is having a boom in Texas. We even hear stories of how the seeds of Sudan are accepted in some places for making change! Up through the rich soils of the Mississippi Valley at least as far north as Iowa the Sudan grass is certainly worth trying, for it makes a great crop of fodder on rich soils. We have been considering this grass for our own farm, where the object is to secure as much organic matter as possible for plowing under and raise the needed hay on a small area. Henry Field, the Iowa seedsman, has found this grass a heavy yielder, but he gives this warning:

The trouble with Sudan is that it is so greedy that it will rob everything within reach. One man wrote in the other day asking if he could sow it in his orchard to use as a mulch around the trees. He had the old idea of growing the mulch right on the ground where it was to be used. I told him not to do it, for the Sudan would undoubtedly rob his trees. It will live and thrive under remarkably hard conditions. In fact, I believe it will make a good crop anywhere and under any conditions, but the quality that enables it to do this is its absolute selfishness and greediness. If there is a drop of water or a particle of fertility in the soil within reaching distance, it gets it and keeps it, and the neighbors can take care of themselves.

Our problem has been to find a crop which will give a fair amount of grain and fodder in the orchards without robbing the trees. We have found this in our flint corn with a cover crop seeded at the last cultivation. Evidently the Sudan grass would do more harm than good on our thin hill soils.

Feeding a Raccoon.

WHAT is the best food to feed coons and how often should they be fed? How long does it take a coon to mature? How often do they breed and at what age? How many young do they breed to a litter? F. M. F.
New York.

Raccoons will eat almost anything and it is best to give them quite a variety. Meat should form a rather small part of the food. All kinds of vegetables; beets, carrots, turnips, potatoes, green corn, etc., cut in small pieces and mixed with small amounts of meat, fish, clams, crawfish, etc., would be right. Ordinary table scraps, if fresh, are all right. It is a good rule in feeding most animals to give what will be eaten up clean in about 15 to 20 minutes three times a day.

Little is known of the breeding habits of the raccoon but it is probable that wild ones have the first litter when about a year old and in this region they probably have only one litter of three to five or six in a year. We sometimes see very small coons in the Fall, and it may be that they occasionally breed twice in a season. ALFRED C. WEED.
Wayne County, N. Y.

Chances in Pennsylvania.

THE letter from a correspondent living in Schoharie County, New York, as to farm values applies to more than one locality in the East. Here in Montgomery Co., Pa., land with excellent farm buildings can be purchased on easy terms, and at figures that would not replace the buildings. The soil is good, and prices of farm products are high; everything that can be raised on the farm can be sold for cash to hucksters who have stalls in various markets in Philadelphia, which city is not over 40 miles from the extreme part of the county. The roads are good, taxes are low, and it is mainly inhabited by a most excellent class of Pennsylvania Germans, who, while mainly using that language, speak English also. The farmhouses are usually built of stone or brick with slate roofs; when built of lumber in most instances have slate roofs and sometimes the siding is the same material. The barns are what as known as Swiss, with a basement and overhang in the rear. Dairying and poultry raising are the main means of support, although fruit and general farming engage the attention of a great many. The soil is ideal for peaches, apples and pears, the crops were on the bumper order this season. There are many creameries where the so-called Philadelphia print butter is made. Butterfat has not gone below 40 cents per pound this season. Milk shippers receive five cents gross, which is nearly 4½ cents net. Eggs bring from 40 to 46 cents at the door. The farms range in size from 15 acres to 60, very rarely going over the last size. I am acquainted with men who have farms as small as three acres on which they are making good livings from poultry. I have traveled all over the United States, also in Europe and South America; we have had large farms in Ulster and Sullivan Counties, N. Y., but this is the country for a man with an inclination to work. Come and see us.
Pennsylvania. H. C. W.

Markets in Boston.

TODAY I visited the produce markets of Boston, with a view to learning selling conditions on this end of the produce business. There are several so-called "markets," Faneuil Hall Market, Clinton Market, Quincy Market, etc., where the commision merchant, offices and storerooms are situated close together; a large number, with a continual hustle and bustle and shifting of produce all about. Often the ground floor is the office and exhibition room, and the basement is the cold storeroom and packing room. Upon the sidewalk are the displays of fruit and all the sorts of produce. Prices are here talked and produce sold. Grocers' teams are backed up to the sidewalk to take away produce; the grocers generally buy tomorrow's produce this afternoon. Some of the teams belong to the commission merchants and are used to cater to the hotel trade.

I noticed especially the manner of displaying the fruit. Boxes and barrels are opened for inspection in gronps. One pile of boxed apples was especially attractive. The apples were large, fancy Maine, polished, neatly packed with paper between each layer and over the top, and upon the outside was a neat placard giving the shipper's name, and the grade, kind and number of apples. A very neat affair, I thought, but I also observed that the boxes had been packed without the supposedly necessary bulge. The man in charge explained to me that a bulge tended to injure tender-skinned apples, and that no bulge was needed to assure tight travelling. I wonder, is this true?

I inquired of the commission man to whom I had been sending hennery eggs this past Summer whether there were good prospects in selling fancy eggs under a brand name, and whether the public desired especially an unwashed egg. To the first question he replied, "No, selling eggs under a brand name would give the grocer who sells them a chance to hurt the name of the brand by careless and slow handling. When eggs are sold on merit as eggs, they will bring a fair price and, when in the hands of the grocer, cease to be a responsibility to the producer." To the second question he replied that eggs were not supposed to be washed anyway, though they might be wiped with a damp rag. He said that washed eggs would not keep at all well, and that there would probably be a demand for an unwashed egg. He suggested the use of vinegar in wiping eggs, as it will remove dirt and leave the shell rough. PHILIP M. MARSH.

EVENTS OF THE WEEK.

DOMESTIC.—Under a decision by the Appellate Division, in New York, Nov. 27, William R. Hearst will probably have to repay the city about $200,000 in damages after the fireworks explosion in 1902 in Madison Square, when the National Association of Democratic Clubs was celebrating Hearst's election to Congress. Hearst was sued for damages as an individual and as president of the association. His defence was that the exhibition was held on a permit given by the city, and he had no responsibility. Mrs. Margaret V. Shea, whose husband, Denis Shea, was killed, recovered $24,543 against the city. The city used this suit as a test case in suing Hearst, and the Supreme Court decided against him, whereupon he appealed. This appeal the Appellate Division has now dismissed.

New arrangements being completed by the American Commission for Relief in Belgium insure the despatch early in December of one ship of 3,000 tons capacity each day from various ports in this country.

The Supreme Court held, Nov. 30, that the "Jim Crow" car law of Oklahoma, which permits railroads to carry sleepers and dining and chair cars for whites without providing "equal" accommodations for colored travelers, is invalid because it violates the Fourteenth Amendment to the Federal Constitution. The decision means that railroads that go through Southern States will either have to discontinue separate coaches or run coaches for negro citizens and provide equal accommodations at stations and other resting places.

Forty-eight deaths from hunting accidents in Wisconsin, Michigan and Minnesota is the toll in these three States, according to reports received in Chicago, Nov. 30. Reports from correspondents show a death roll of 24 in Wisconsin, 13 in Michigan and 11 in Minnesota. The "big game" hunting season came to a close on the above date.

Chairman Frank P. Walsh of the Federal Commission on Industrial Relations announced, at Denver, Colo., Dec. 1, that the commission would on December 28 begin an investigation of the Rockefeller Foundation. Hearings will be held first in Washington and later in New York city. Walsh said that the investigation was decided upon because the foundation was pointed out by laboring people as one of the chief causes of social unrest. Many persons, he said, question the wisdom and legality of setting aside $100,000,000 to be kept intact and in private hands for 100 years. The commission began its inquiry into the Colorado strike causes, Dec. 2. Gov. Ammons, the first witness, was followed by George A. Carlson, Governor-elect, and John C. Osgood, president of the Victor American Fuel Company.

Mrs. Mathilda Francolini, who earned the title of "Real Estate Queen" a year ago, when the various companies she headed became embroiled with the law, was arrested here Dec. 3, on indictment charging forgery in the second degree. She was arraigned before Judge Mulqueen, who held her in $10,000 bail for trial. Mrs. Francolini induced a woman who owned property in Cedarhurst to sign a paper which she was told, was needed to effect a sale of the property, but which was really a mortgage for $2,500, Mrs. Francolini obtaining the money. The indictment and arrest came after a prolonged investigation into Mrs. Francolini's real estate dealings, and the examination of more than 150 complaints made to the District Attorney by persons who invested their money in her companies. She was the president of several companies, which were absorbed by the Annex Homes Company in September, 1913. This concern went into bankruptcy last September, with liabilities of $790,000 and no assets.

FARM AND GARDEN.—Satisfied that the ravages of the foot-and-mouth disease among cattle have been checked and that the epidemic is now under control, officials of the Bureau of Animal Industry, Nov. 27, determined to begin lifting the quarantine imposed on the cattle markets of various States. An order releasing certain counties in Wisconsin, Illinois and Iowa, which were placed under embargo because of the foot-and-mouth disease, consequently was issued by the Department of Agriculture. It became effective on November 30, and provides that cattle for immediate slaughter may be shipped from the counties named in interstate commerce. Cattle also may be received for feeding purposes, but not shipped out for feeding elsewhere.

The twentieth annual session of the Winter short courses in agriculture will be held at the University of Vermont and State Agricultural College beginning Monday, December 28th, and closing Friday, February 26th. It is intended to cover the study of creamery operations in a broad way and to teach the essential principles and practices of soil management, dairy and other feeding, stock breeding and judging, vegetable gardening, orcharding, forest management, etc. They are open to men and women 18 years of age or older, who have had a common school education. No charge is made for tuition to residents of Vermont. Incidental fees aggregating $10 are the only charge made. Text books cost about $5, working suits about $3. The entire cost of the nine weeks' session need not exceed $65. Parties interested should write for information to Professor A. A. Borland, Morrill Hall, University of Vermont, Burlington, Vermont.

The U. S. Weather Bureau states that a special service given to orchardists and raisers of tobacco, oranges, cranberries, and certain other crops has been rendered by means of frost warnings issued in Spring and Autumn. The growers are kept fully advised as to the dangers of frost and are warned of the necessity of resorting to measures of protection through artificial heating and smudging, or flooding the bogs in the case of cranberries. The establishment of a "Cattle Region Service," through which bulletins containing statements of weather conditions over the stock ranges of the Texas panhandle and adjacent regions are issued, constitutes a new feature of the bureau's work.

The Federation of Jewish Farmers of America held its annual meeting in New York, beginning Nov. 29. The sixth annual report shows that there are about 6,000 Jewish farmers in the United States, 1,000 of whom are in this State. All are prospering. There are 13 farmers' associations, with 63 branches in 11 States. Their aim is to help the Jewish farmer by coöperative methods. A report read by A. D. Wolf, of Centreville Station, secretary of the Coöperative Fire Insurance Company of Sullivan County and Adjacent Counties, showed a decrease of 25 per cent. in fire insurance rates since the organization of the cooperative association. The principal objection Jews have to becoming farmers, one of the delegates said, was the inadequate opportunities of educating their children in their own religion. Coöperation is advocated for transporting produce to local markets. It is planned to have a federation stand at the New York City open market. A paper by Governor Glynn on the "First Farmers' Saving and Loan Association" was read Dec. 1. Calvin J. Huson, Commissioner of Agriculture, John J. Dillon, State Food and Market Commissioner and Edwin F. Howell, directors of the Land Bank, addressed the convention.

Arrangements have been made to hold the second annual State Agricultural Convention in coöperation with the thirtieth annual meeting of the Granite State Dairymen's Association at St. Cecilia Hall, Manchester, N. H., February 10th and 11th, 1915. The first day's program will be under the auspices of the State Department of Agriculture and the second day will be conducted by the Dairymen's Association.

The Massachusetts Fruit Growers' Association will hold its annual convention, Jan. 13, 14, 1915, at Horticultural Hall, Worcester, Mass.; F. Howard Brown, secretary.

With the approval of Gov. Fielder and the State Committee on Tuberculosis Among Animals, the New Jersey State Board of Health, Dec. 1, directed the slaughter of 497 head of cattle affected with the foot-and-mouth disease in New Jersey. This action followed the discovery that under the wording of the act creating the commission on tuberculosis that body is authorized to coöperate with the Federal bureau of animal industry in checking the spread of any contagious or infectious disease. Heretofore it had been supposed generally that the commission was limited in the scope of its work to tuberculosis. The State Board of Health, Dec. 1, declared a quarantine in Salem County and recommended that all public vendues in the southern part of the State be put off for one month.

The quarantine against Canadian potatoes has now been raised. This was laid on Dec. 22 of last year, because a new disease had been found in Canada and the U. S. government determined to keep it out if possible. Now the Canadians may send into this country, potatoes grown from clean seed on land that has not produced a diseased crop. They must be inspected and certified by the government agents. These potatoes will only be admitted through the ports of Boston and New York where government inspectors are located. The quarantine of last year kept many Canadian potatoes out of the country and to that extent helped the market for American stock. It now seems likely that heavy shipments will follow from Canada.

THE EUROPEAN WAR.—Nov. 26 the British battleship Bulwark was destroyed by an explosion at the mouth of the Thames, with a loss of about 800. The cause is unknown.....Two British cargo steamers were destroyed off Havre, Nov. 26, by German submarines. .....A detailed statement issued by the British Board of Trade, Nov. 26, sets forth that after sixteen weeks of war 1,221 German steamers, representing 89.3 per cent. of Germany's mercantile marine, have been captured, detained or have sought refuge in port. In the same period 195 British ships have been removed similarly from the mercantile service, representing 2.9 per cent. of the British mercantile marine.....Nov. 30 it was officially announced that the Kaiser had gone to his army in Poland, where Russia claimed extensive gains, which were denied by Germany. Severe fighting continued near Lodz, where the Germans broke through the Russian lines..... The occupation of Belgrade, after four months of investment, was officially announced in Vienna, Dec. 2, together with the statement that the Servian army is cut off from Nish, Servia's temporary capital. It appears from the news that Servia's resistance is crumbling before vastly superior power, and that great losses in men and a lack of munitions have hastened disaster.....The Italian government is again protesting to Austria concerning drifting mines. A number of casualties have been caused by them along the Italian coast.....King George went to France, Nov. 30, and spent several days with the British troops at the front. British law has not permitted a sovereign to be active on the battlefield for about 170 years, the last king active in war being George II. .....Severe fighting continues in Flanders, with little advantage to either side. Hand to hand fighting of great ferocity has followed the artillery duels. Up to Dec. 3 the Germans had not advanced on the coast.....It was announced, Dec. 2, that Gen. De Wet was captured in South Africa.....With only one dissentient—Herr Liebknecht, Socialist—the German Reichstag voted, Dec. 2, a new war credit of 5,000,000,000 marks ($1,250,000,000).....It was officially announced, Nov. 30, that Germany had paid $256,000 to Luxemburg for damage to fields and crops and $65,000 for damage to streets and buildings.....An Amsterdam paper announced, Nov. 30, that the German Governor of the province of Brabant, which includes Brussels, has called a meeting of Brussels financiers and has told them that Belgium must pay $7,000,000 monthly for the maintenance of the German troops in addition to the war levy of $75,000,000 imposed as a fine "for violations of neutrality by Belgium and losses ensuing therefrom to Germany."....Nov. 20-23 British camel constabulary defeated a dervish force in Somaliland, which is a British protectorate on the northeast coast of Africa, bordering on the Gulf of Aden.

COMING FARMERS' MEETINGS.

New Jersey State Horticultural Society, annual meeting, State Experiment Station, New Brunswick, Dec. 8-10.

Connecticut Sheep Breeders' Association, annual meeting, Unity Hall, Hartford, Dec. 15.

New York State Breeders' Association, New York State Sheep Breeders' Association, New York State Dairymen's Association, annual meetings, Seneca Hotel, Rochester, N. Y., Dec. 16.

Farmers' Week, Pennsylvania State College, December 28, 1914 to January 8, 1915, State College, P. O., Penn.

Winter short courses, University of Vermont, Burlington, Dec. 28, 1915 to Febrnary 26, 1915.

New York State Fruit Growers' Association annual meeting, Rochester, N. Y., Jan. 6-7-8, 1915.

January 9th to 15th, inclusive, 1915 Mid-Winter Exposition, State Fair Grounds, Columbus, Ohio, Corn, Apple, Dairy and Poultry Shows combined.

Massachusetts Fruit Growers' Association annual convention, Horticultural Hall, Worcester, Mass., Jan. 13-14, 1915.

Coöperative Associations of the State of New York, second conference, Utica, January 13, 14, 15, 1915.

Virgina State Horticultural Society, nineteenth annual convention Winchester, Va., January 13-14, 1915.

Second annual meeting of the New Hampshire State Department of Agriculture and the thirtieth annual meeting of the Granite State Dairymen's Association, Manchester, N. H., Feb. 10 and 11, 1915. Fred Rasmussen, Secretary.

New York State Agricultural Society 75th annual convention, the Capitol, Albany, N. Y., Jan. 20-21.

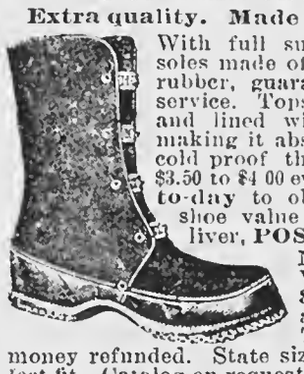
The Fire Fly
SINGLE CELL BATTERY LANTERN

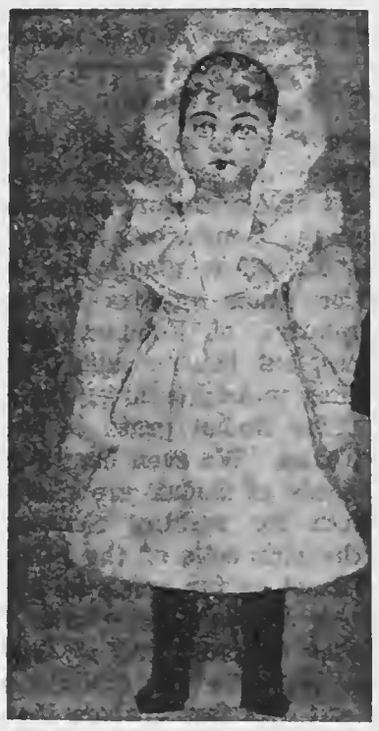
Projects Light Ray 300 Feet. Burns 1 Hour Per Day for 30 Days on any No. 6 Dry Battery. Most Light. Lightest Weight. Least Possible Rigging. Best Contact Device. Locks Positively On or Off. Hangs Well from Hand, Belt or Pocket. **Lowest Price** Attractive Proposition to Canvassers **$1.00 (without battery) Postpaid.**
HERBERT S. POTTER, 240 State St., Boston, Mass.

4-BUCKLE One Piece ARCTIC
FOR MEN AND WOMEN
Extra quality. Made all in ONE PIECE.



With full snow excluding tongue, soles made of best quality pure gum rubber, guaranteed to give lasting service. Tops thoroughly rubberized and lined with pure wool flannel, making it absolutely waterproof and cold proof throughout. Retails for $3.50 to $4.00 everywhere. **Send $2.29 to-day** to obtain the greatest overshoe value ever offered. We deliver, **POSTPAID**, to your home. **Men's Sizes, 5 to 13; Women's Sizes, 3 to 8.** Every pair sold with an absolute GUARANTEE of satisfaction or money refunded. State size of shoe to insure perfect fit. Catalog on request. **A. WEINBERGER & CO., 112-113 South St., New York. Dept. X.**

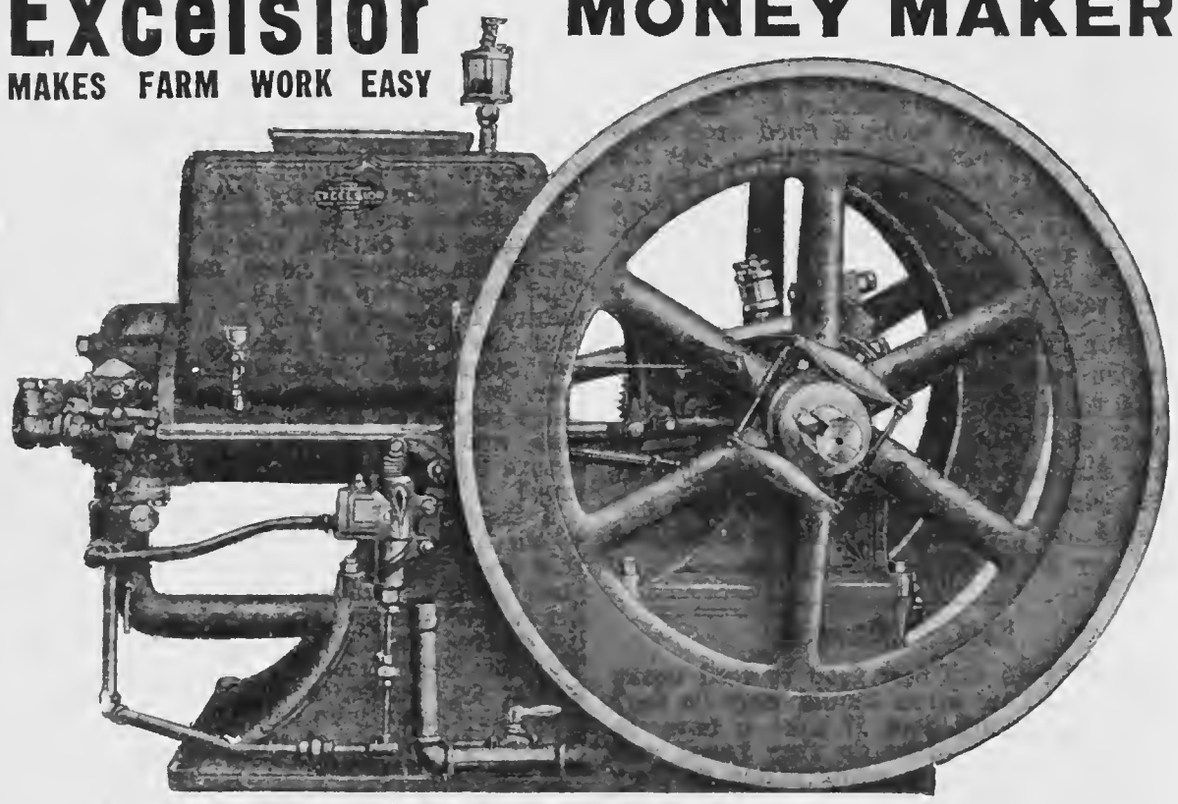
For One New Yearly Subscription, or Ten 10-Week Trial Subscriptions, or Three (3) Renewal Subscriptions (one of the three may be a renewal of your own subscription).



This "American Maid" non-breakable Rag Doll. It is 14 inches high, patented compressed fabric face, stuffed with pure, clean cotton. Pretty dress; indestructible and sanitary.
The Rural New-Yorker, 333 West 30th St., N. Y.

THIS Excelsior MAKES FARM WORK EASY

YOU NEED THIS MONEY MAKER



You need the Excelsior engine doing work on your farm. Every day you go without it you are losing money. It is the one dependable power, the Johnny on the spot that is always ready for work when you want it. No delay starting in the morning. Your men do not hang around doing nothing while you are waiting for the engine to start. If we were to write you the flattering things many of our customers say about the Excelsior you would think we were stretching the truth. One man says: "You should change the name Excelsior to the **ALWAYS READY** or the **WILLING WORKER.**" Another says: "I have owned five different makes, but the Excelsior is the best of all." Another says: "I did not know an engine could be so good." Thousands say: "They work perfectly, run like a clock, etc." We do not ask you to take any man's word for what our engine will do. You can buy an Excelsior engine without the payment of a single penny in advance. Set it to work on your hardest work. If you agree with all of our customers that it is the best engine you ever saw and the biggest labor saver, keep it; if not, ship it back. You are the judge and jury. If you will tell us the size farm you have, we will make you a special proposition. Act quickly.

R. CONSOLIDATED GAS & GASOLINE ENGINE CO., 202 Fulton St., New York City.

Construction and Repairs

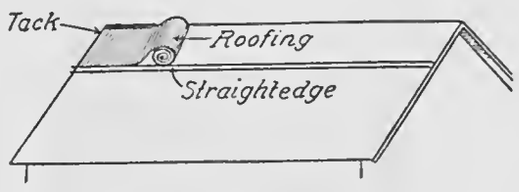
Birch for Rustic Work.

I INTEND to build a rustic fence, also a Summer house. I have some birch trees growing here which I intend to use. Would you tell me when and how I should cut these birch trees so the timber will be ready for use, also what seasoning is necessary? E. K.
Botsford, Conn.

Material for rustic work should be cut when dormant, as it is not likely to be damaged by bark worms. If cut when the sap is up, it is invariably attacked by borers, and in many instances the small wood will be literally eaten up in a year or two. This is particularly true with woods that contain rather a sweet sap, such as hickory, birch, etc. The material requires no seasoning before using; it may be used immediately. In fact it is a distinct advantage to do so, as it is much more easily worked while green and not quite so likely to be split by nails at the joinings. If it is not convenient to use the material while green, it should be stored under cover until needed. K.

How to Lay Roofing.

BEGIN at the top, and strip down the old shingles about three feet, pull the nails and sweep. Measure down the desired distance and lay a straight edge; unroll the roofing inside down. Start straight and tack the upper corner of roofing, and work across. Nail the upper edge according to directions found in roll. Move down the staging, strip down as before, and relay the straight edge, letting the upper edge of the roofing lap



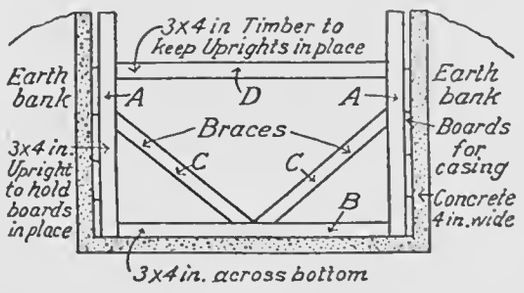
on the first layer until across, then raise the edges, letting the one fall under the other, working back to the beginning.

Before moving the staging, nail on the saddle board. In ripping off the old shingles as above, not much dirt gets through the roof, as the roof is covered about all the time. There should be a double course of shingles at the eaves, or one can shingle higher. By using the straight edge, the roofing is kept from sagging. If the roofing bothers in laying it is because the rolls have leaned instead of standing on end; therefore the roofing will not lie as well nor last as long. J. B. BRYANT.
Maine.

Cistern Construction.

ON page 1237 E. J. W. has an article on a water-proof cistern. Will he state how he arranged the reinforeing bars and give the size? I understand by his article that he added the hydrated lime, but I have a letter from a cement company advising 12 per cent. to replace the same proportion of cement.
Maine. F. C. C.

F. C. C. inquires regarding several omitted features in cistern construction, and states that an authority writes him that 12 per cent. hydrate lime should be used to replace that quantity of cement. I wrote, as previously mentioned, a large



cement company, and their engineer recommended 10 pounds hydrate lime added to each batch of concrete containing one bag cement. This adds so slightly to the cost of the mixture that it is almost negligible, and in our case it certainly produced the results we were after, as cistern is three years in use now. No inside finish of any kind has ever been necessary, and absolutely no water ever seeps through. Our soil is very heavy, and subsoil is a heavy clay, so we did not find any necessity for using reinforcing rods. If soil is sandy or very light and porous in texture reinforcing may be necessary, or at least a heavier wall should be used even up to eight inches if cistern is 10 to 12 feet or more in depth. On two sides our concrete extended two feet above ground, but was afterwards banked up to near top. We placed at corners ⅝-inch round rods bent at angle about 10 and 12 inches apart, and several lighter rods along side, allowing ends to overlap a foot or more. We did not use any vertical rods. If your cistern can be banked up solid to top and your soil is firm you do not need any reinforcing whatever.

The picture shows casing for cistern. After bottom has become slightly solid, place timbers 3x4 inches, *a. a. b., c. c. d.,* in position indicated on each of four sides. The boards 12 inches wide can then be set into place as concrete is filled in on sides. These boards require no nailing as the concrete holds them in place. Be careful to make the framework strong, as sloppy stone and sand concrete exerts a very strong pressure on forms. ELMER J. WEAVER.

Repairing a Leaky Cistern.

SOME of your readers may have a leaky cistern, and I will tell how we repaired ours that had given us trouble for 35 years. Several attempts were made to stop the leak during that time. The water came in at one side right at the bottom, two or three pails daily in a dry time. The cistern had a good, solid dish-shaped bottom, which we covered with stones about three inches in diameter leveling them up with smaller ones and coarse gravel.

Put a piece of pipe eight inches long between the stones just off the old bottom; this should be threaded on upper end and large enough to take suction pipe of pump inside and a little space to spare. Connect the pump with suction inside. Now put on a good heavy coat of cement over the new bottom, made of two parts sand to one part cement, mixed quite thick so it will not run into the spaces between the stones, as these should be kept open for air and water. The space between the large pipe and the suction pipe will let the air out as the water comes in, and if the pump is used occasionally there will be no pressure against the cement while it is hardening, and therefore no air or water will be forced through the cement before it hardens to perpetuate the leak. After the cement is hard, take out the suction pipe, screw a cap on the pipe bedded in the bottom, cut off the suction pipe to correspond to the diminished depth, and the job is done. Of course the first water will be affected by the cement. If the cistern leaked at the side I would bore down on the outside where the water came in, as deep as cistern, and chip a small hole through wall to lead the water to the bottom and proceed as before after repairing the old leak. GEORGE CREHORE.
Ohio.

The Iron-pan Ice Makers.

THE Kansas Agricultural College reviews the old plan of making ice in an iron pan:

"The ice plant is made of galvanized iron and consists of a double tank with an inner tank about 10 feet long, two feet wide, and 12 inches deep. The top of the tank should be slightly wider than the bottom. The inner tank should be divided into six compartments by means of galvanized iron strips. This double tank should be placed near an outdoor pump where the compartments can be easily filled with water. Being exposed on all sides, the water will freeze in from one to three hours. A bucketful of hot water poured into the space between the two tanks will loosen the cakes so that they may be removed. One freezing will give five cakes of ice, each weighing 120 pounds. Fourteen freezings will yield four tons of pure ice, or enough to last an average family for a year. The cakes of ice can be packed away in sawdust in the icehouse or cellar as they are frozen."

During the past 25 years we have had many letters about this plan of ice making. It is possible to freeze the cakes of ice in such a device and where there is no pond it may prove satisfactory. Most of our correspondents seem to regard it as more or less of a plaything.

Saving Wastes in California.

A FEW years ago California was regarded as the land of large ideas. Californians would not have thought of trying to save what Eastern people considered waste. Times are changing, however, and in California as well as elsewhere the little things must be saved and the corners must be cut. For a great many years the piles of sheep manure which accumulated around the old sheep ranches were left untouched, as it did not seem worth while to remove this plant food. There came a time when the price of plant food in the East rose to a point where it paid to grind and ship this sheep manure just as clearly as it paid to mine and ship nitrate of soda from the west coast of South America; thus the waste product took on value. Again, when irrigation was first started in California, there was water enough for all, and few people have heeded to its waste. When the water began to be scarce efforts were made to save it, and whole lines of irrigating ditches are now lined with pitch, clay or concrete to save the waste of water by seepage. One after another of these waste products was utilized. Now comes Bulletin No. 244 of the California Experiment Station on the "Utilization of Waste Oranges." Travelers come back from the west coast and tell us of seeing the ground under the orange trees covered thick with fruit, only a small proportion of the superior fruit being boxed and sent to the market. Now, a chemist has been at work devising a use for this waste fruit, turning it into orange juice, orange wine and orange vinegar, and in this way adding to the value of the fruit crop by making the waste product available. The bulletin gives a very good description of the way these products are handled in order to fit them for the market. This same thing seems to be going on, and vast quantities of food products formerly wasted because they could not be sold in their natural form, are now being worked over and developed so as to give them value.

Developing a Market Day.

WE farmers of this town are talking of getting up a market day, which we hope will give us a chance to dispose of our farm produce and live stock at a fair profit. At the present time we have very poor success trying to dispose of our stock and produce, having no market. The nearest towns are North Adams, Mass., and Brattleboro, Vt., each town being 20 miles away and mountainous roads. We have a railroad 26 miles long, ending in this town; it starts from Hoosac tunnel on Boston and Maine R. R. and the express and freight rates are enormously high, so it is almost impossible to ship goods and make a profit. Can you give us a little information on the farmers' market day, as I understand it has been tried very successfully in other places? The town of Wilmington, Vermont, has a population of 1400 and the village about 300. We depend on our dairy cows and maple syrup for our cash returns and we are trying to raise apples for market, also with rather poor success so far. This Fall we are feeding our apples to stock as we cannot sell them at any price.
Vermont. G. T. C.

R. N.-Y.—This is a case for general discussion and experience. There is no set rule for developing a market day—the conditions and circumstances of the locality must be considered. Here is a section off the main railroad lines and in a country community. There are probably readers of THE R. N.-Y. who have helped develop just such a situation. Will they tell us how they did it?

SMOKEHOUSE ADVICE WANTED.—I am about to build a new smokehouse, and am in the market for ideas along that line. We kill about 20 or 30 hogs, Spring and Fall, and smoke the hams, bacons and shoulders. I have lots of stone and brick on the place.
Maryland. W. W. BRADLEY.

"ENGLISH mutton chops," read the man with the menu. "German fried potatoes, Russian caviar, French peas. Hum! Waiter, I want to be strictly neutral." "Yessir." "Give me a Spanish omelet."—Louisville Courier-Journal.

Cold?

THE warmth and easy fit of Hansen's Gloves keep your hands cosy and blood circulating, and the strong horsehide protects perfectly.

Hansen's Gloves

With or Without Lining

This glove has plenty of style, with fit and the soft smoothness of the *cut* seam.

Write for Free Glove Book

Describes many of the 500 styles—mittens too—for every occupation. All giving *most value* for *least cost.* Get Hansen's Gloves from your dealer. If he is not supplied, write us. Anyway, write for book.

O. C. Hansen Mfg. Co.
136K. Detroit St.
Milwaukee, Wisconsin

LET US TAN YOUR HIDE.

Cattle or Horse hide, Calf, Dog, Deer or any kind of skin with hair or fur on. **We tan and finish them right;** make them into coats (for men and women), robes, rugs or gloves when ordered.

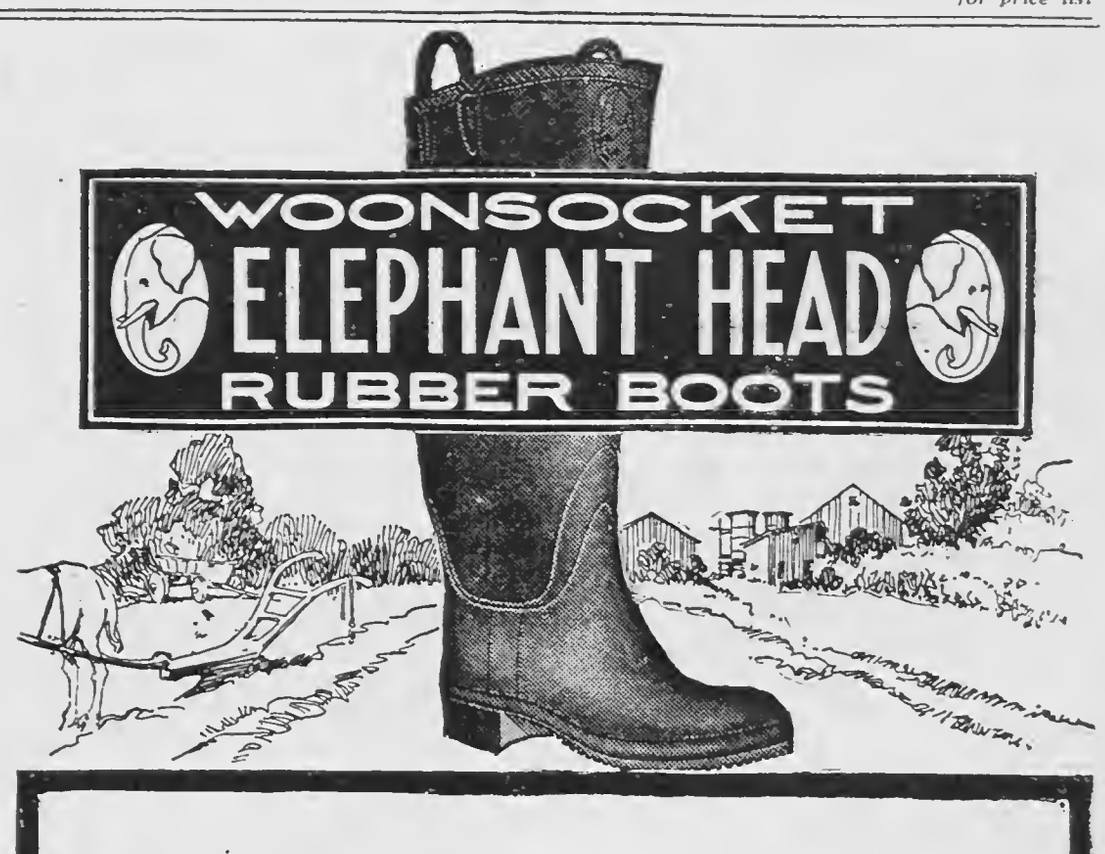
Your fur goods will cost you less than to buy them, and be worth more. **Our illustrated catalog** gives a lot of information which every stock raiser should have, but we never send out this valuable book except upon request.

It tells how to take off and care for hides; how and when **we pay the freight both ways;** about our safe dyeing process which is a tremendous advantage to the customer, especially on **horse hides and calf skins;** about the fur goods and game trophies we sell, taxidermy, etc. If you want a copy send us your correct address.

The Crosby Frisian Fur Company,
571 Lyell Ave., Rochester, N. Y.

RAW FURS

G. I. FOX, 279 Seventh Ave. N. Y. A square deal, liberal assortment, top prices. *Write for price list*



Buy These Rubber Boots and Be Sure—

1st. Be sure of long wear. ELEPHANT HEAD RUBBER BOOTS are made of pure, high grade rubber and tough selected duck reinforced at every seam and joint.

2nd. Be sure of comfort. ELEPHANT HEAD RUBBER BOOTS are lined with soft wool net and are made to fit comfortably.

3rd. Be sure of square treatment in the store where you buy your footwear. Only the best dealers are permitted to sell them.

All the better dealers sell ELEPHANT HEAD RUBBER BOOTS. You can depend on anything you buy in the stores that have them.

WOONSOCKET RUBBER CO., Woonsocket, R. I.

Hope Farm Notes

I PRINT the following correspondence to show how several people may all look at the same thing and report it differently. Four blind men went to see an elephant. One got hold of his trunk, another handled his leg, and another his side. One was ready to swear the elephant was like a rope, another said he was like a tree, and the third knew he was like a wall. I did think I had made it clear why I entered those "scrubs" in the egg-laying contest, and why they are to be bred. I wish to show, if I can, that by breeding utility stock with a pedigree to such common stock you can increase the egg-laying capacity. Of course you cannot know there has been any improvement unless you can compare actual performance. Yet here we have the following:

I have been greatly interested in the laying contests, especially so in the one just closed. But for the life of me I cannot understand why the Hope Farm man ever entered these mongrels, and now to make matters worse, he is to re-enter them in the coming contest and to *breed from them!* Can it be possible that he is trying to prove to the American farmer, that an ordinary "scrub" hen will lay as many eggs as a purebred hen? Trying to prove that a flock of scrubs will lay as many eggs as a flock of hens that have been bred for generation after generation, for a heavy egg yield? If so is he not doing the purebred hen a great injustice? Is it a fair deal to the men who have spent a lifetime, practically trap-nesting and breeding for heavy egg production? Take Mr. Barron for instance. I believe he claims to have taken 20 years to get his birds where they are today. Would the Hope Farm man take an ordinary dairy cow, and put her in competition with a purebred Holstein, with a great milk record, and think the grade cow would give as much milk as the purebred Holstein? I'll admit that according to the reports of the contest just closed, the "scrubs" did lay more eggs than many of the blue bloods. But that doesn't prove anything. What pen *won* the contest, what pen took the second, third, fourth, fifth prize, etc.? Were they scrubs? Oh no. If you want to prove anything to the American farmer why not take one of those purebred pens that laid fewer eggs than the scrubs, and mate them with a cockerel of their same breed, purchased from one of the owners of a winning pen, and in so doing show the American farmer what really can be done by careful selection and breeding, to make the great American pen "shell out" more eggs?

A. L. VREELAND.

Well sir, I thought I had explained at least a dozen times about all this. I picked up seven very poor specimens—worse than what I see running about on many farms. My plan was to see just what these hens would lay and then see what their daughters, by a high-class cockerel would lay. I would certainly test a poor scrub cow against a fine Holstein. Then I would like to test her daughter by a brother of that fine Holstein. In what better way can we test the value of pure blood? Why does not Mr. Vreeland get into the egg-laying contest with his pureblood stock and prove that they are superior to the scrubs? The fact is that the time has come when hen men want a performance rather than a promise. Just read the following:

That egg-laying contest was a very good thing, not only for those engaged therein, but the public in general, especially that portion that considers "the hens," "scrubs," or whatever you may choose to call them. Although they did not do as much as expected they deported themselves sufficiently to show the public and the hen editors in particular that pedigree is not utility; that much of this fancy strain business is nonsense, that it is the individual and not the "papers" that do the actual business. Perhaps this matter has impressed me more than most others from a sad fact. Years ago my father and myself bred up a flock of hens by a slow and steady process until we had a flock of good utility fowls; good layers, matured well, made good weight, were uniform and hardy. At that time a certain hen fancier in Massachusetts and another in New Jersey came into the limelight and were heralded as the topnotchers, and like many another breeder of fowls, and other live stock we lost our heads with their "get-rich-quick" birds, and invested. We bought pedigree and failure. The following Fall we had a lot of things, some of which made great scores but were minus constitution, some were over-grown, others were crooked-back and twisted-breasted, and the flock dropped from a record of 219 to 160, and some of the physical weaknesses were never eliminated. Therefore with your Reds, my advice is beware of "the card." Use your own good judgment, selecting the good average bird, with a steady eye for a particular type, always remembering it has taken two thousand years to make a very slight improvement even in the human race.

G. L. GORDON.

I have received dozens of letters from people who say they have damaged their flocks by introducing blood from show room or blue ribbon strains. No man in his right mind pays long prices for cattle to improve his herd just because the owner says they are "purebred." The buyer wants to know what performance there is in the pedigree. It is coming to be the same thing with hens.

My "scrubs" beat 20 pens at the egg-laying contest, and if they had been trained to start off as others did they would have been halfway to the head. I have no thought of trying to prove that a scrub hen is better than a purebred hen, but I do expect to show that many of the purebred hens are merely purebred scrubs—barely paying their way as layers, and incapable of improving a farmer's flock! I do not know of any more useful work than a fair demonstration of this.

My scrubs were entered the second year to see if the poor layers would not come back and pay as two-year-olds. I think they will, but I want to find out. I also expect to breed them to a fine utility cockerel with a certified pedigree and enter 10 of their daughters by this cross next year. For contrast I will also breed them to a "dunghill" or to the son of some purebred that we know is a poor layer, and also enter 10 of his daughters from the same hens against the others. Now will Mr. Vreeland suggest any more practical plan for finding whether "pure blood" will improve a flock of farm poultry?

As for my pen of Reds, I am to mate them with the son of a hen that has a certified record of 246 eggs in 301 consecutive days. He may not be of just the color and shape which the show room judges would select, but I use him on the performance of his mother, and if I am not greatly mistaken the hen men of the near future will buy their breeding stock on this principle of performance just as dairymen would buy a herd bull. I think these poultrymen who have spent their lives developing a strain of poultry ought to get right out into an egg-laying contest and show us.

I could pile up proof mountains high to show that hen men are waking up to this proposition of performance in the pedigree. Here is another man who watched the scrubs and saw the point which Mr. Vreeland missed:

I was much interested over the scrubs' egg record. I have some ribbons and prizes from poultry shows to my credit, but several years ago I decided to breed for eggs instead of shape and feathers, and this will account for my sympathy for the "scrubs." E. J. B.

I can readily understand why the fanciers and blue ribbon men have consistently opposed these egg-laying contests. After a few years of these records and of breeding from these winners, the value of utility stock will be made so clear that we shall wonder why we lost so many years in getting going. These Hope Farm scrubs are worth barely $10, but I think they will do their share in putting the true valuation upon tail feathers!

KILLING RABBITS.—The papers have had much to say lately about a boy in New Jersey who shot a rabbit out of season and was sent to jail for doing so. All through our country the rabbits do great injury to fruits and vegetables. They have ruined great blocks of young trees for us. I have heard many questions about the rights of a resident of New Jersey to protect his property when these pests appear. In order to know just where we stand, I wrote the State Fish and Game Commissioners and they tell me that the following section of the law "will give relief."

2. (As amended February 28, 1912.) Nothing in this act shall be so construed as to prevent farmers and fruit growers from trapping rabbits in box traps during the entire year; provided, however, that such trapping shall be done on the property owned or leased for the raising of fruit, vegetables or other produce by the person so trapping; and provided, that the person so trapping shall first have made an affidavit before a justice of the peace that rabbits have injured fruit, vegetables or other produce on his or her premises, and shall have immediately sent the same to the president of the Fish and Game Commission, who, upon the receipt of the said affidavit, shall, in his discretion, issue to said person a permit to so trap, and the person so trapping shall keep the rabbits alive, and notify the Fish and Game Warden of the country, who shall liberate said rabbits in such parts of the State as may be directed by the Board of Fish and Game Commissioners; provided, further, that no person or persons shall be permitted to barter or sell any rabbits so trapped.

There is a bunch of red tape for you, but it seems to be under our laws the only way to handle Mr. Rabbit out of season and escape fine or jail!

TAXES.—Here they are again—one of the sure things of life. This form of Christmas present is never appreciated by the property owner. I will print the tax rate on our farm property and also in the county town in order that others may compare notes.

	Town Property	Farm Property
County tax.....	$ .46	$ .46
County poor.....	.01	.01
State school.....	.27	.27
Borough	1.12	1.00
Library tax.....	.05	....
Special school....	.97	.34
	$2.88	$2.08

I also pay a poll tax of one dollar and a dog tax of 75 cents. The "Borough" tax includes the cost of our local government, roads, etc. My property is now assessed for nearly three times what I paid for it—the increase being largely due to new buildings. Our poor surely do not cost us much. In New Jersey we have no State taxes except for schools, but you will see that our local governments make up for lost time in local assessments. These figures are not printed as any complaint, but for the sake of comparison.

H. W. C.

Forest Planting.

HAVING been a forester I am interested in the Hope Farm man's recent remarks on the planting of trees, and quite agree with some of them. It would have pleased me better if he had said White pine instead of hemlock and spruce, and it is not yet too late to start the planting. In 1903 I sent home some seedlings of White pine which had had one season's growth. These stood two years in the nursery, and in 1905 were planted in an old field where chestnut and Black walnut had been planted four to the rod each way about ten years before. The pines were planted where the other trees had died, or made no growth (some of them were less than six inches tall after 10 years' growth). At present these pines average about 15 feet tall, and are growing in height about tthree feet a year. Farmers in this State can get better trees than we set out by applying to the Conservation Commission at Albany and the price is actual cost.

A. C. W.

Wayne County, N. Y.

Dynamite Drainage.

REGARDING those wet spots referred to on page 1260, one-half stick of 25% dynamite three feet six inches below surface will give relief to wet spots troubling you. The hole can be either pinched or bored with long auger. It should be very well tamped after charge is placed. I have cured hundreds of wet spots by this treatment. Drainage once given, will not have to be repeated.

INCREASE THE VALUE OF YOUR FARM with Pulverized Rock Phosphate, HORSE HEAD brand. Mix 2 lbs. per head per day and increase the value of your manure 75%. Write us for delivered car load price.

HASEROT LIME & PHOSPHATE CO., - CLEVELAND, O.

ONE DOLLAR buys 150 envelopes and letterheads. Cards, tags, labels, either, 125, 50c.; 300, 90c.; 500, $1.40; 1,000, $2.40. We prepay express. Chatham Courier Co., Chatham, N. Y.

SKUNK We pay top prices for Skunk, Mink Muskrat, and all raw Furs. Price list free. M. J. JEWETT & SONS. REDWOOD, N. Y. :-: DEPT. 29.

Save $1 to $2.50 PER TON on Lime

Ground limestone at the quarry costs from $1 to $1.50 per ton. Freight and hauling makes it cost from $1.50 to $3 delivered on your farm. If you have lime rock available, it's like throwing away money to buy limestone at these prices! For, with a JEFFREY LIME-PULVER on your farm, after quarrying the rock, you can grind it for 50c per ton. You can save from $1 to $2.50 per ton. In a short time the machine has paid for itself. Your farm is free from rock—richer—more productive. You can grow the clover and alfalfa that before refused to thrive. You have lime in a form that's better than burnt lime.

Grinds 2 to 3 Tons Per Hour

The Jeffrey Lime-Pulver will take the big rocks—any size up to 4 inches thick and 11 inches long—and grind them to a powder at the rate of from 2 to 3 tons per hour. It's both a crusher and a pulverizer. No need to have two machines—one to crush and one to pulverize. The Lime-Pulver takes the big rocks and grinds them to a fineness that will go through your spreader without the slightest trouble—no clinkers to get in and break it up. You can grind the rock coarser if you desire. But fine grinding is of utmost importance.

Grinds Rock for Road Work, Corn Tobacco Stems, Bone, Etc.

The Lime-Pulver is a dual purpose machine. It will grind rock for road work—2 to 3 tons per hour. Grinds corn on the cob, tobacco stems and bone. Made in the famous Jeffrey shops, of materials almost wear-proof. Ball-bearing pulverizer—pulverizing hammers of Manganese steel. Mounted on wheels and as easily moved as a wagon. Sold on a money-back guarantee. If you have lime rock available and do not own a Lime-Pulver, you pay for it over and over again without ever really owning one, if you have lime rock, you can make big profits selling ground limestone to neighbors. Write today for full particulars, price and our free booklet on Lime.

THE TEXAS BELL TOMATO.

SOME years ago a person in Austin, Texas, sent me a paper of tomato seed marked Texas Belle, as a remarkably disease-resisting tomato. In a recent article in a Texas paper Mr. F. T. Ramsey says that the name is Texas Bell, as it was produced by selection by Mrs. Texas Bell of Gonzales County. I grew the tomatoes in North Carolina in soil badly infested with the Southern bacterial blight, and never saw a rotten fruit nor a diseased vine, and the plants went through till frost carrying a load of tomatoes all the time. Since then I have grown them here in Maryland with similar results.

This is a very small tomato of biscuit shape, evidently the result of crossing the small round tomato with a larger one. Its chief value is in its wonderful resistance to all the diseases that attack the tomato, and hence of great value in the South, where the blight is so destructive to tomatoes. The keeping quality of the fruit after it is ripe is another great advantage. One Summer in Raleigh, N. C., I left a lot of the ripe fruits on a bench in an empty greenhouse, and went off for a month's trip at farmers' institutes. On my return I expected to find all the tomatoes decayed and ready to clean out the seed. But to my surprise, while many of them were shrivelled and dried up there were many also perfectly sound and smooth, and not a rotten one.

It seems to me that here is a chance for good work in the breeding of a disease-resistant tomato of a larger size and marketable character, and it is a work that the Southern stations especially might take up. In its present shape the Texas Bell is not a good salable tomato for the Northern markets, though its immense productiveness would make it of value for the making of catsup. Nothing I have ever grown in the shape of a tomato will make a larger number of fruits per plant. The last time I grew them two years ago, having plenty of large tomatoes, the few Texas Bell were let alone, and the fruit was literally in heaps on the ground, and never a rotten tomato was seen. This season I intend to get more seed and grow a few plants for crossing with some larger and more solid tomato to try to produce a larger and more solid tomato with the same resistance to all the rots that affect the tomato. This is about the only improvement we can now hope for in tomatoes, for so far as the character of the fruit is concerned we have about reached the top notch in tomatoes. With a disease resistant tomato of equal quality with the best we now have, there would be an immense gain to growers. The eating quality of the Texas Bell is as good as any, and for cooking they are all right. Few will run much over two inches in diameter: W. F. MASSEY.

Crooked Asparagus; Yellow Eggplants.

WHAT is the cause of asparagus coming up crooked, even growing so under the ground before it shoots up. 2. What is the cause of eggplant turning yellow after being set out.

Bethel, Conn. D. F. C.

1. It would appear that you have some plants of the species Streptopus, mixed in with the variety of Officinalis. The natural inclination of Officinalis is to grow erect and straight; occasionally a stalk will come somewhat twisted or wavy, but such growth is usually caused by some obstruction in the soil, such as stones or other hard substance that the stalk is compelled to go around, which will cause slight distortion or crooked growth of the stalk. The species Streptopus, however, seldom comes straight, the name defines its nature, which is to twist or turn. It is no uncommon thing for this species to produce distorted stalks which are as a rule abruptly bent in the middle, or arched shape, the tops of the stalk returning to the ground. This species will produce mostly crooked stalks, no matter how loose and friable this soil may be.

2. The discoloring of the leaves of eggplant or any other plant, removed from the seed bed, flat or pot, particularly if they have had the protection of glass or protecting cloth, may be attributed to two principal causes, the disturbance of the roots and the change of temperature caused by the removal to the open ground. If the growth is soft, such as will be produced in good soil in a high temperature under glass, any disturbance of the root system or sudden change to a lower temperature or both, will always result in a check of top growth, drooping and finally the turning yellow of the leaves which will drop, a new shoot pushing out at the axil of the leaf when growth has been re-established. In pot-grown plants this condition is not present to so great an extent as in flat or boxed plants, as little root disturbance takes place when the plants are transplanted to the open ground, the change of temperature being about the only disturbing factor, which will cause more or less of the leaves to turn yellow. When field growth has taken place it is natural for the plants to lose their main stalk leaves, branches taking their place. K.

Transplanting Clove Pinks and Peonies.

WHAT is the best time to transplant clove pinks? I have a clump of them and want to put them into a border. 2. When will be the best time to move peonies and what precaution is necessary? S. A. B.

Vineland, N. J.

1. Transplant the pinks very early in the Spring, as soon as the frost is out of the ground. They should be moved before they begin to make new growth. As their favorite situation is in warm soil, free from surface ice, they begin to grow quite early. A protection of snow is very congenial to them, but they always suffer if in a place where ice can form over the crowns.

2. Peonies may be planted in Fall or in early Spring, before growth is made It is generally considered that the best time is from the middle of September to the middle of October, which gives the roots a chance to take hold before the ground freezes. The crowns should be set about two inches below the surface. A deep, rich, moist soil is desirable; the peony is a gross feeder, and abundant moisture is especially necessary during the period of bud formation. Fresh unrotted manure is undesirable, and it is considered good practice to enrich the ground thoroughly the season before planting. After planting a light mulch of well-rotted manure may be given in November, and forked under lightly the following Spring. Liquid manure, given about every 10 days, is desirable during the blooming period.

Treatment of House Plants.

FLOWERS, like people, require fresh air. Ideal conditions of temperature and ventilation for human beings will be found satisfactory for flowers, says M. F. Ahearn, associate professor of horticulture in the Kansas State Agricultural College. It won't hurt plants to have a bath occasionally to remove the dust from the leaves and open up the pores. This is best done by placing the plants in the sink or a tub and spraying the leaves with water. A damp sponge can be used for this purpose. If the leaves on your flowers get yellow and drop off, it is quite possible that you have been overwatering the plant or possibly have been drowning it. Sometimes plants need watering every day, and again once in two days is enough. No exact rule can be given. If you rap your knuckles sharply against the pot and it gives forth a hollow or ringing sound, the plant needs watering. Always water from the top. Use enough water to moisten the soil clear to the bottom of the pot. If any water runs through into the saucer or jardiniere, empty it. This water, if allowed to remain there, will cut off the roots' supply of air. In Winter the plants should not be repotted. The best time to repot is in the Spring. In Winter the roots of many plants lie dormant and the roots should never be disturbed during this period. One of the greatest enemies of plants grown indoors is coal gas. Illuminating gas is nearly as bad. The slightest trace of gas will retard the growth of the new leaves.

"MOTHER," asked Tommy, "is it correct to say you 'water a horse' when he is thirsty?" "Yes, my dear," said his mother. "Well, then," said Tommy, picking up a saucer, "I'm going to milk the cat."—Ladies' Home Journal.

"For the Land's Sake, use Bowker's Fertilizers; they enrich the earth and those who till it."—*Adv.*

New KEROSENE LIGHT BEATS ELECTRIC OR GASOLINE

10 Days FREE—Send No Money

We don't ask you to pay us a cent until you have used this wonderful modern light in your own home ten days, then you may return it at our expense if not perfectly satisfied. You can't possibly lose a cent. We want to prove to you that it makes an ordinary oil lamp look like a candle; beats electric, gasoline or acetylene. Lights and is put out like old oil lamp. Tests at 14 leading Universities show that it

Burns 50 Hours on One Gallon

common coal oil (kerosene), no odor, smoke or noise, simple, clean, won't explode. Three million people already enjoying this powerful, white, steady light, nearest to sunlight. Guaranteed.

$1,000.00 Reward

will be given to the person who shows us an oil lamp equal to the new **Aladdin** in every way (details of offer given in our circular). Would we dare make such a challenge if there were the slightest doubt as to the merits of the **Aladdin? GET ONE FREE.** We want **one user in each locality** to whom we can refer customers. To that person we have a special introductory offer to make, under which one lamp is **given free.** Write quick for our 10-Day Absolutely Free Trial Proposition and learn how to get **one free.**

MEN WITH RIGS MAKE $100 TO $300 Per Month Delivering

the ALADDIN on our easy plan. No previous experience necessary. Practically every farm home and small town home will buy after trying. One farmer who had never sold anything in his life before writes: "I sold 51 lamps the first seven days." Another says: "I disposed of 34 lamps out of 31 calls." Thousands who are coining money endorse the Aladdin just as strongly.

No Money Required

We furnish capital to reliable men to get started. Ask for our distributor's plan, and learn how to make big money in unoccupied territory.

MANTLE LAMP COMPANY. 670 Aladdin Building, Chicago, Ill.
Largest Manufacturers and Distributors of Kerosene Mantle Lamps in the World

Healthy Trees Perfect Apples
when you spray with
"SCALECIDE"
—the spray that's endorsed the country over as "The one great dormant spray." Mixed 1 to 15, it kills every scale it reaches or you get your money back. Guarantee with every package. It's easily prepared, non-corrosive and non-clogging. 1bbl. equals 3bbls. lime sulphur. Destroys eggs, larvae and fungi in dormant state. Simple, safe, economical. Send for free booklet, "Scalecide, the Tree Saver." Write today, to Dept. N.
B. G. PRATT CO.
50 Church St., New York City

SAN JOSE SCALE REMEDIES
KIL-O-SCALE, LIME SULPHUR SOLUTION and ORCHARD BRAND Spray material are the most reliable spray remedies for sale. Ready for use by simply mixing the water. Write for special circulars and catalogue on spraying machinery.

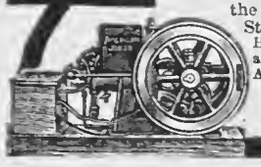
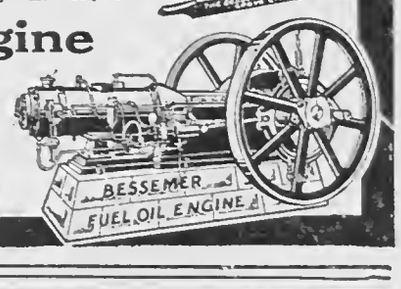
4 H. P. $64.95


We have about 1000 engines on hand, intended for foreign shipment. This business is now cut off owing to the war. We must turn the engines into cash. So we cut the prices down to practically cost. Stock includes all sizes from 1 to 12 H.P. Motors are of high grade materials and construction. 2 year guarantee. A postal brings you details and prices.
AMERICAN ENGINE CO.
603 Boston St., Detroit, Mich.

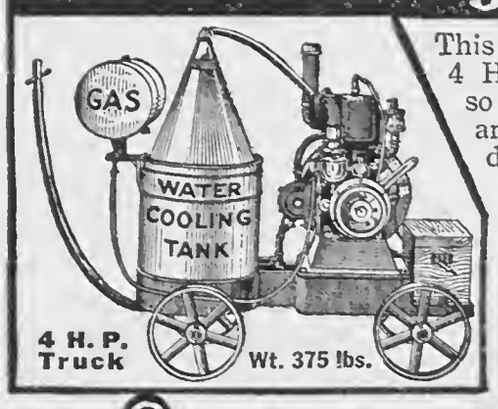
FREE TRIAL 30 DAYS BESSEMER NON KEROSENE CRANKING ENGINE

"The Masterpiece of the Largest Manufacturers of 2-Cycle Engines in the World"
"Pays for itself in fuel saved!" That is the proud achievement of the Bessemer Kerosene Engine—and that's what interests you! Built to give years of steady service on the lowest operating cost, that's why the Bessemer is displacing other types of engines everywhere. Non-cranking, simple, only three moving parts—a boy or woman can run it. Thousands of Bessemer Kerosene Engines are giving daily service on farms all over the world. 2 to 10 H. P.—30 days free trial. Immediate shipment. Write for Catalog "K." If you require a larger engine, use the
Bessemer Fuel Oil Engine
Lower picture shows the famous Bessemer Fuel Oil Engine. Widely used in irrigation, flour mills, factories, electric light plants, etc. Runs on cheap fuel and crude oils. No batteries or magnetos required; ignition is automatic after starting. 15 to 155 H. P. Special Catalog "O" free.



THE BESSEMER GAS ENGINE COMPANY
123 Lincoln Ave. Grove City, Pa.

Cushman Light Weight Truck



This is the light-weight, quick-action 4 H. P. Truck Outfit that has proved so handy for farm work. **A boy can pull it** around from job to job, yet it easily handles all work up to 4 or 4½ H. P. Pump circulation to water tank on front of truck **prevents overheating,** even on all-day run. Cushman Engines are not cheap engines, but they are **cheap in the long run.** They are built to run without trouble, and are the most useful engines made
For All Farm Work
And For the Binder
Very light weight and steady running permits Cushman Engines to be attached to other machines, such as harvesters and balers, as well as doing all regular stationary jobs. 4 H. P. alone **weighs only 190 lbs.;** 2-cylinder 8 H. P. only 320 lbs. **Throttle governed;** economical of fuel. 4-Cycle. **4 to 20 H. P.** Runs at any speed; speed changed while running.
C. M. Scott, Pawnee City, Nebr., says: "I bought a 4 H. P. Cushman and think it is the **finest engine I ever saw run.** Am grinding shelled corn—can grind 30 bushels per hour with 6-inch buhr grinder. Have seen a great many other engines, but the Cushman has them beat at every turn."
ASK FOR FREE ENGINE BOOK
CUSHMAN MOTOR WORKS
847 North 21st Street, Lincoln, Nebraska
For Spraying
Cushman 4 H. P. can be used on any sprayer—belt, gear or chain drive. Runs on side hills as well as on level. Clutch pulley permits stopping pump without stopping engine.

SUBSCRIPTION: ONE DOLLAR A YEAR

To foreign countries in the Universal Postal Union, $2.01, equal to 8s. 6d., or 8½ marks, or 10½ francs. Remit in money order, express order, personal check or bank draft.

Entered at New York Post Office as Second Class Matter.

Advertising rates, 75 cents per agate line—7 words. Referenees required for advertisers unknown to us; and eash must aeeompany transient orders.

"A SQUARE DEAL"

We believe that every advertisement in this paper is baeked by a responsible person. We use every possible preeaution and admit the advertising of reliable houses only. But to make doubly sure, we will make good any loss to paid subscribers sustained by trusting any deliberate swindler, Irresponsible advertisers or misleading advertisements in our eolumns, and any such swindler will be publiely exposed. We are also often ealled upon to adjust differenees or mistakes between our subseribers and honest, responsible houses, whether advertisers or not. We willingly use our good offiees to this end, but sueh eases should not be confused with dishonest transaetions. We protect subscribers against rogues, but we will not be responsible for the debts of honest bankrupts sanetioned by the eourts. Notiee of the complaint must be sent to us within one month of the time of the transaetion, and to identify it, you should mention THE RURAL NEW-YORKER when writing the advertiser.

HOW do you like this for a motto? *"Never sell anything so poor that you would not buy!"*

*

SINCE the article on electric lighting from water power was printed we have had many questions covering details. They will all be carefully answered. Next week in the monthly Woman and Home magazine there will be a good article on the use of electricity for cooking, heating and household power. We shall do our best to induce country people to harness the water which has so long gone through its lazy course down hill.

*

ONE of the things hard to explain is why seekers after farm wisdom do not have greater faith in local authorities. Week after week we receive questions from the very towns in which our college nd experiment stations are located. Some of these questions are of such a character that only a resident of the home section can answer them. In many cases, in order to be sure, we go to the experiment station within a few miles of the inquirer's home for the facts. Now what is wrong? Do the people want to prove the station's answer or does the station enjoy the reputation of the average prophet?

*

I HAVE an old farm—"an ill-shaped thing, but mine own"—from which I derive much pleasure and now and then a rabbit. Please tell me how to make it pay without work. I don't like work. J. M.

Here is an honest back-to-the-lander. Most of them say they are willing to work long and hard. This man admits that work tires him and he wants pay—without labor. The enthusiastic scientist told the hard-headed farmer that in the future plant food would be so concentrated that he could carry enough to fertilize an acre in his vest pocket. "Well," says the farmer, "when you do that *you will carry the crop from that acre in the other vest pocket!*" When a farm pays you a profit without labor on your part some one else will do the work. We know of cases where farms have been fenced in and rented out as pasture. If there is timber on it this timber can be sold. We know of men who rent hill property to campers. The greatest money returns from a dollar's worth of labor that we have found came from planting apple trees in naturally moist grass land sod, piling the cut grass around them, pruning slightly and keeping them clean of insects and disease.

*

OUR good friend, J. H. Hale, recently made the trip to California and while there addressed the fruit growers at their convention. Hale rightly received an ovation. He carried the wit and wisdom and mellow philosophy of New England—a human nutmeg of the right sort of wood. Among other things Hale carried a pocketful of New England Baldwin apples—some of them from a tree a century old. You know how those Pacific coast people brag about their fruit, yet this is what Parker Earle says about Hale's Baldwins:

"If gray old Connecticut, worn and exhausted by 300 years of farming, can grow such apples as these, right at the doors of the consumers, then let Oregon and Washington look out!"

"Grey old Connecticut!" You spell the word wrong. Cut out your "y" and substitute "a-t," and you have a truer word *great! "Worn and exhausted soil!"* Why, man, did you not know that some of the most productive farming in the world is done in the Connecticut Valley? Did you know that the 10-year average yield of corn in all New England was 39.3 bushels at an average price of 83 cents. This average on the Pacific coast is only 29½ bushels at 70 cents. The average for Illinois is 35½ bushels at 54 cents. "Worn and exhausted" Connecticut stands at the head of the country in average corn yields, with 46 bushels. Did you also know that last year four New England States and New York and Pennsylvania produced 15,912,000 bushels of those beautiful Baldwin apples, and that they have only just begun to know how to do it? Our children will live to see the day when the apple orchards on those hills of gray New England will give larger annual returns than the orchards and vineyards of California. Half a century ago New England could not dream of the possibilities of the Pacific coast. To-day California cannot dream of the possibilities of the upper Atlantic watershed.

*

THE starting of the new Food and Market Department of New York State is one of the most hopeful things that has ever happened to both producers and consumers. It is the direct outcome of the long exposition of the 35-cent dollar. For many years consumers in towns and cities have been held up and forced to pay extortionate prices for their food, while farmers have been systematically robbed and forced to accept a mere pittance with no voice in fixing the price. These evils have long been recognized, and for years we have pointed them out. Now the talk and the thought has crystallized into action. The new department is a fact, and starts at once on a sure foundation to work out a remedy for those market troubles. It faces a large proposition. There must be such an elimination of wasteful and extravagant distribution that the producer will receive more for his goods, while the cost to the consumer is reduced. Both these things must follow if the problem is to be worked out, for the consumer and the producer have interests in common. They must understand their mutual interests and work together.

No one can expect instant relief from the evils of our present system. They have been growing for years—it will take time to organize even plans for changing them. From the start, however, farmers will have a representative in the New York markets. He will develop trade in farm products and look after the interests of shippers. Later it is hoped that farm produce may be sold through this representative at auction or otherwise, with the power of the new department used to see that the money for the goods is promptly paid. The work of this department will be planned wisely and promptly. It needs your help as a producer or a consumer in its efforts to obtain a square deal for both classes. We must develop a strong retail demand for the products of New York farms. Both consumers and producers must help in this. The former must learn to feel a pride in using goods "made in New York." The producer must also take pride in packing and grading his goods so as to suit this trade. This branding and grading is absolutely essential if we are to build up reputation and demand for New York State products. With such brands the consumer may be educated to demand them. The new department will furnish information and help in this grading and packing. We are now in a position to begin to add cent by cent to the 35-cent dollar. The department needs the coöperation of all people who wish to help settle the food and market problems. Help yourself by helping to make it successful.

*

LAST year was the first year I ever owned fruit trees, and, of course, I, being an amateur, did not know just what to do for aphides, as they appeared on peach, plum and apple, etc. Looking up some books on the subject I found three which said to use arsenate of lead, and all agreed that in any strength used in water, would not injure foliage. So I put about 1½ tablespoonfuls in a quart of water and proceeded to rid the trees of aphides. *It did.* I killed one peach and very likely one Baldwin apple and about ruined two plums. O. B.

New York.

Is it possible that any reputable books on entomology advise a strong solution of poison for plant lice? This is the most remarkable advice we have heard of. The plant lice are sucking insects, and are to be killed by oils or other "contact" sprays which reach them from the outside of their bodies. Such a strong poisonous spray would blast young foliage like the hand of death! This may be a case of "take heed how ye hear," for it is true that readers sometimes jump at conclusions. The author who would directly advise such spraying of trees in foliage ought not to be left at large. It is poison for the leaf eaters, but fats or oils for the leaf suckers.

*

HERE is a case which you may well consider. Two farmers offered homemade sausage for sale. These men did hard outdoor work in the cold, and preferred to have a large amount of fat in the sausage. They made it for sale just as they used it at home. There was a good demand for this sausage from people who lived in town. They did not work at hard labor outdoors, and the sausage was too fat to suit them. They wrote and offered kindly criticism—telling what they wanted. One farmer considered such criticism offensive. The sausage suited his family, therefore it was all right—he would not change it. The townspeople stopped buying it. The other man wanted to learn. He sent and bought several pounds of a brand of sausage which city people like, and saw that they wanted more lean meat. He studied it out and gave his customers what they wanted and to-day he cannot begin to fill his orders. This is a small thing, but it stands for a great principle in direct dealing with the consumer. It is your business to give him what he wants. The buyer will decide the quality—not the seller. Unless the buyer can have this privilege he will not deal direct with the producer.

*

NOW here is a word to dairymen. How would you like to make a suitable Christmas present to the dairy business? Suppose you and every other man who makes a living milking cows were to walk right into the grocery store and speak this little piece so that the storekeeper had to understand it!

"I believe in spending my money at home, and building up home trade, but I will not trade with a man who is taking away my chance of making a living. Cut out the oleo and I will trade with you. Otherwise I shall trade elsewhere."

Now would a dairyman be justified in taking such a stand? If he did, and this increased the sale of pure butter, would not more milk be required to make this extra butter? Would not the withdrawal of this milk from the city supply give you a better chance to obtain a fairer price for your milk? Is there any answer?

*

ONE of our readers attended the great potato growers' convention in Wisconsin. When he got home he wrote us as follows:

These conventions of farmers are becoming very common in our State, but there is one very serious fault with them, and that is this: It is the progressive aggressive farmers who attend, the men who are trying individually to do a little better than the ordinary, while the self-conceited, indifferent man who most of all needs the help of these conventions, stays at home and finds fault with the conditions, the weather, the "party in power," etc. Thus it "was, is, and always will be world without end."

Now the question to ask is this: Is it in any way the fault of the organizers of these conventions that the class of farmers mentioned does not attend them? We have often had this question up before. It is the biggest thing in farm education to-day. How can you get out into the highways and byways and "compel them to come in?"

*

FROM the time when first the scientists began to tell us of the wonders of radium we felt sure that some one would come along to apply "radio-activity" to fertilizers. This has finally come in the crushed ores from which radium has been extracted. This crushed ore, used in pot experiments, seems to stimulate plant growth, but raising one plant in a pot is a very different thing from planting an acre. Figuring on the one pot is like arguing that because one hen under constant care makes a profit of $3, therefore 1,000 hens are sure to pay $3,000. There is less radium in this ore advised as a fertilizer than is actually present in an acre of average soil! There is also another substance known as uranium in this ore, and the effect of this substance upon plant life is not yet understood. Our advice is to let these "radio-active" manures alone and confine our activity inside the radius of known chemical knowledge. Let the chemists experiment with Uncle Sam's money. Keep your coin for surer things.

BREVITIES.

SPREAD the truth! Can anyone spread it out too thin?

ANOTHER college novelty is a free correspondence course in concrete making by the West Virginia College.

NOW comes the old demand for smaller coins—two and three-cent pieces. Making exact change means economy.

THE latest thing in "short courses" is a cream tester's course at the South Dakota Agricultural College, lasting four days.

THERE has been a heavy purchase of seed wheat in the South. The crop may be seeded up to January in the lower Gulf States.

WHEN you load a wagon see that the load is evenly distributed. Too much of the load resting on either front or back wheels or to one side will increase the draft.

TIMOTHY is called an exhaustive crop, yet at the North Dakota Station wheat following Timothy was increased over wheat following wheat. One great value of a rotation is the change of soil habits which different crops bring.

NOW they claim in Wisconsin that the annual dairy products of that State are worth more than all imported raw silk or all the combined imports of raw and manufactured wool, or of all the tin, all the iron and steel and all the fertilizers combined as imports. The Wisconsin cow is some animal.

THE FOOD AND MARKETS DEPARTMENT.

A Statement of Its Purposes.

PART I.

THE IDEAL.—The purpose of the Department of Foods and Markets is to find a profitable market for the products of the farms of the State of New York, and at the same time to devise such an economic system of distribution of farm food products that, through the saving, the farmer may receive more and the consumer pay less.

PLANNING THE WORK.—It is proposed to accomplish these results by eliminating waste and extravagance; and by organizing an economic system for the distribution of farm food products to replace the extravagant and wasteful system heretofore in use. The new system begins at the farm. The department will keep the farmer advised as to the demand for different kinds and grades of products, and thus direct him in the production of goods that promise ready sale and best prices. He will be instructed in the proper grading and packing of his products; and he will be assisted in organizing local coöperative associations by which he can develop and supply his local market. The department will keep him advised as to the demand from day to day of metropolitan markets, and of prevailing prices in these markets. This will enable the farmer to ship his surplus products to centers where there is a ready demand and where best prices prevail.

LOCAL ORGANIZATIONS.—It is proposed to organize a local farmers' coöperative association in the territory adjacent to each of the cities and villages throughout the State, and in each city and village itself to provide a closed building to which the farmer may deliver his produce in bulk, just as his milk is now delivered to a creamery; or as his tomatoes are delivered to a cannery. This centre building will serve as a grading and packing house; it will serve as a local market for the city or village in which it is situated; and as a shipping house for the surplus that must find a distant market. If possible it should be located in the centre of the town to accommodate the people; and on a line of railroad so as to ship economically in car lots. When practical, the grading of produce should be done at the farm, but in any event the goods will be subject to inspection on delivery to the local warehouse.

THE LOCAL MARKET.—It is not intended to disturb any local conditions; nor is it necessary to do so. If the housewives go to the local market for their supplies, they should always have the selection of grades of fresh produce at a reasonable price; and the local dealers should be supplied at a price below this to afford him a reasonable profit on goods to supply those housewives who prefer to pay the extra price for convenient buying and home delivery. It will be the aim to keep the local markets supplied with goods of such high quality and commensurate prices that no goods of the same variety could be profitably shipped in from other sections. Local consumption is the best market for the products of the neighboring farms. Practical experience has demonstrated that under a proper system growers can sell direct to consumers at 75 per cent. of the prices ordinarily charged the consumer in retail markets, and at the same time the producer realizes a profit of 30 per cent. above his returns from wholesale markets. It is the ambition of the department to make this direct trade and saving general.

MARKET MANAGEMENT.—These local markets may also receive from other sections shipments of such products as are not produced in the immediate neighborhood for distribution to the local dealers or families of the town. The market will require the service of one competent manager, and such other help as may be required from time to time. This management may be the employers of the coöperative association; and under the control of its board of directors; or if thought advisable, the department may, under the law, license and bond a man to handle the business, and fix the percentage he would be allowed to charge for his services.

STORAGE FACILITIES.—In many sections the volume and quality of products will warrant the erection of cold storage facilities and canning factories, or evaporating plants. These facilities will preserve products that are a little over-ripe for safe shipment. They will absorb surplus products in time of overproduction, and they will utilize many articles of excellent food value that in the raw state could not be shipped at a profit, and are in consequence allowed to rot on the ground.

SETTLING RETURNS.—The returns to the producer are a mere matter of accounting. Produce will be weighed on delivery; and the farmer will receive a memorandum of his delivery and he will be credited for the same on the books of the association, and when the prices prevailing for the day are determined, the credit will be carried out in dollars and cents. The department will furnish the association with price quotations from the principal domestic and foreign markets daily. Settlements will be made at fixed intervals of a week or month; and if funds are required in the meantime any bank will be glad to supply it to an organization doing this kind of business.

SOME ASSOCIATIONS have already been formed to assemble and ship produce. With the increase of such organizations, the development of local markets, and the systematic handling of shipments in general markets greater results must be attained.

DIRECT BUYING.—The department will encourage direct trade of individual farmers with individual consumers where it can be profitably undertaken. It is probable that the department may find a way to furnish information and establish relations that will facilitate this trade between such individual producer and consumer as may be in a position to profit by it.

MEAT PRODUCTION.—The scarcity of meat and the ever-increasing price for that article of food indicate that the eastern farmer can again raise meat producing animals at a profit. Neighborhood associations for the breeding and sale of meat producing animals would greatly help in the development of this industry. They operate very successfully in some of the Western States, and in Europe, particularly in Denmark. The industry was practically driven out of the State by the competition of the Western packers; but they are no longer able to supply the demand. To revive the industry in the State we must find a ready outlet for the product. Here again we get a lesson from Europe. Paris has its abattoirs where any farmer in France may send his fat animals for slaughter by a public official. A regular charge per head is made for the service; and the meat is cared for until sold, and return made to the owner. The department has authority to care for the meat and sell it, and return to the producer. It will probably find a way to provide for the slaughter as soon as the industry attains proportions to justify it.

THE FARMER'S REPRESENTATIVE.—The individual farmer as well as the farm associations will always have a representative in the metropolitan market and in due time in the other important cities of the State. It will be the duty of the Department to keep constantly informed of the conditions of the markets in the large cities of the county and of the foreign demand. This information together with the prices realized on last sales will be made public to the farmers of the State, and special information will be furnished by wire when required. This information should direct the produce to the centres of greatest demand as indicated by the price offered and the available supply. It will enable the farmer to avoid shipments to markets that are already over-supplied and save disappointment and loss.

J. J. D.

Handling Fish.

HERE is a load of haddock as handled on the T wharf at Boston. Large numbers of fishing vessels tie up to this wharf, after which the slippery contents of the holds are hauled up in great baskets, which are dumped into boxes on the scales. After

FISH ON A BOSTON WHARF.

weighing, two men with pitchforks quickly toss the fish into a truck or hand cart, which is then hauled to packinghouse or store. The single fish shown in the truck on right side of picture, was a horse mackerel weighing about 700 pounds. This was handled with a hook like those truckmen use on packing boxes. Fishing off the "banks" in Winter is a cold, disagreeable job, yet those accustomed to it do not appear to mind the discomforts.

The New York Agricultural Society.

THE program for the seventy-fifth annual convention of the New York State Agricultural Society, to be held at Albany January 20-21, 1915, is being made up already, men of national repute having accepted invitations to address the conference. The Housewives' League promise a large attendance of their membership, and the banquet on Thursday evening promises to be an attractive feature. New York farmers and their wives should make this convention a feature of their annual recreation.

Meeting of Co-operative Associations.

LAST week the conference of coöperative associations was in error announced to be held in Ithaca, on January 13, 14, and 15, 1915. The dates are correct, but the place of meeting is Utica, N. Y. Considerable interest is manifested in this meeting. The number of associations has increased since the last conference in August, and considerable progress has been made in development of the business of the associations. A large attendance is expected, but remember that the place of meeting is Utica.

A New Scheme in Trading Stamps.

THE use of trading stamps as a means of advertising has been in vogue for some years. By this system the dealer offers to serve out stamps in proportion to the amount of goods purchased, and when a certain amount has been secured these may be returned and some article obtained as an equivalent for the stamps offered. Usually these agreements are kept, but occasionally the company furnishing the stamps in some distant city fails to make good its agreement with the merchant and the merchant is slow to compensate the holder of a partial set of stamps. Recently we have been treated to a new idea in the way of stamp dealing. By the old system the merchant purchased the stamps and passed them out to his customers as they did the trading. In the new system, which is being worked on farmers exclusively, I think, the farmer is urged to take the stamps and use them when paying for goods purchased, the claim being that the merchant will deduct five per cent. on the bill of goods, taking stamps for the discount instead of cash. So far as this is concerned there is no criticism on the deal in particular if all parties are fully informed regarding it when entered upon. The plan may be a legitimate method of advertising, whatever may be said of it as an economic proposition for the purchaser of the goods.

Now as for the new plan, it seems to have its defects. The canvasser comes along and says that the merchants in town desire to present the farmer with a fine book for keeping his accounts, and at the same time furnish him with information how to best grow various crops, such as Alfalfa, and other productions. He then shows the book, which seems to contain a complete set of blanks similar to those which the State Department of Agriculture got out a few years ago and furnished free to such farmers as would use them. It also contains reprint of certain bulletins from the stations or schools on the growing of crops, all of which are free for the asking. The agent says that his company is coöperating with the railroad, the agricultural department and the schools of agriculture as well as with the merchants in town, all of whom desire to help the farmer. He asks the farmer to sign the contract that he will accept the book from his merchant when it is ready for distribution. He urges the generosity of the merchant in making such a donation, and if the farmer hesitates he assumes an injured tone, because of hesitation in accepting the gift, when it is purely a gift and does not cost a cent.

The real facts are that the contract is an agreement to purchase the book for six dollars and also to receive a small book of trading stamps to the amount of six dollars which the farmer can use when paying for his purchases at the store of the merchant in town, these are to be accepted by the merchant for five per cent. of the purchase at any time, and if all the conditions are carried out the farmer gets back his six dollars when he has traded to the amount of $130. I have traced this to some extent, and have found one merchant who says he is ready to take the stamps as stated. All the others say they have never heard of the scheme or did not agree to go in it. It is fair to say that some of the agents have stated to some of the farmers that the cost is six dollars and the rebate is as stated, but other agents, at other times, have failed to make the correct explanation. There is nothing to prevent the dealer from charging an extra amount for his goods when a part of the price is to be allowed in stamps. Some orders for books have been secured without any explanation further than that first given, that there is nothing for the farmer to pay and that it is a present from the local merchant. It is but a scheme where one ought not to get caught, for he should famliiarize himself with the contract before signing it, but some really good business farmers have signed without reading its provisions. This is the farmer's fault, but it does not excuse the agent nor his methods. It is doubtful if he is giving full value for the six dollars anyway, and if he is it is his duty to state fairly the conditions of the deal.

H. H. LYON.

GRAIN NOTES BY EXPERTS.

BROOMHALL reports European visible supply of wheat as 70,504,000 bushels, an increase of 2,360,000 over previous week.

Corn Trade News states that wheat in the United Kingdom is starting well. In France, seeding except in the war zone has made good progress, but weather is unfavorable, and thrashing returns from the old crop disappointing. Seeding in Russia started well and planted area now covered with snow. Conditions in Austria-Hungary bad, farm work neglected and food supplies high, spot wheat selling recently in Austria at $2.40 per bushel.

Stocks of principal grains in store in this country are in thousands of bushels.

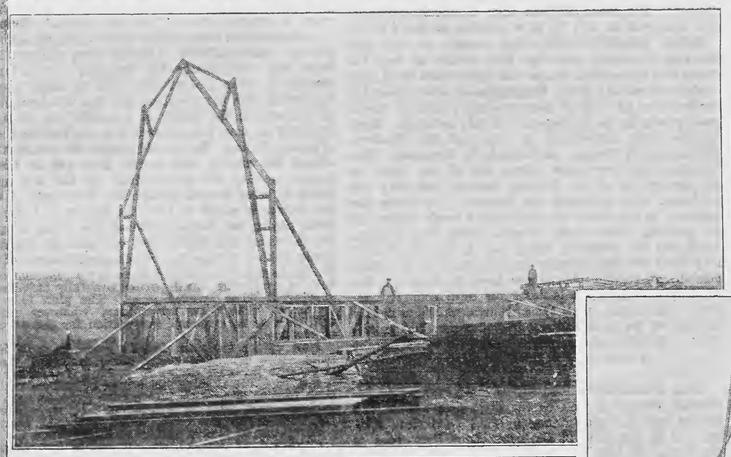
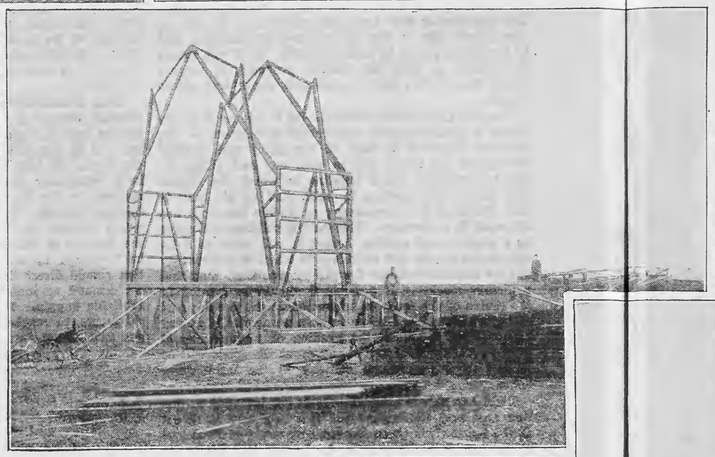
IN the recent Woman's Magazine Mrs. Eddy described the library work of the State Educational Department at Albany. A large number of our readers have already applied to the Department for the travelling libraries.





No matter who does your building, do not forget that

James Barn Plan Service

makes it all easy. This service will help you in selecting a proper location for the barn—with reference to drainage, sunlight, distance from other buildings and from the main road, etc.

It will guide you safely in determining the proper size to build for your present use and how to accommodate the larger herd you expect to own some day.

It will tell you how to face the cows—how to arrange the stalls and gutters—what proportions the building should have—placing of windows, ventilating system, etc.

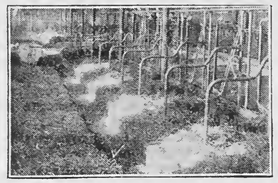
JAMES Barn Plan Service gives the information you need regarding height of walls, location and character of posts, laying of floors and construction of frame.

It gives valuable silo information, and many other facts that any dairy farmer needs when about to build a new barn or remodel the old one.

This JAMES Barn Plan Service Is Free

It is the work of our well-equipped Architectural Department, which we maintain for the benefit of our customers and others interested in good barns.

The services of this department are at your command right now—*free*—whether you expect to build soon or a few years from now.



Please get in touch with us at once. Don't wait until you are ready for the barn—until you need it in a hurry—but enjoy the advantages of our service now and let us help you in every way we can. In getting this service you will have the advice and assistance of W. D. James, who is nationally known as an authority on the designing and equipping of dairy barns.

He was born and raised on a farm—knows dairy conditions in every state—knows just what the dairyman needs in order to get the biggest results at smallest cost and with least trouble.

JAMES Sanitary Barn Equipment

The men back of JAMES Barn Plan Service are the designers and makers of the celebrated JAMES Sanitary Barn Equipment—which includes Stalls, Stanchions, Pens for Cows, Calves and Bulls, Manure and Feed Carriers, Barn Ventilating System, Watering Buckets and other supplies for good barns.

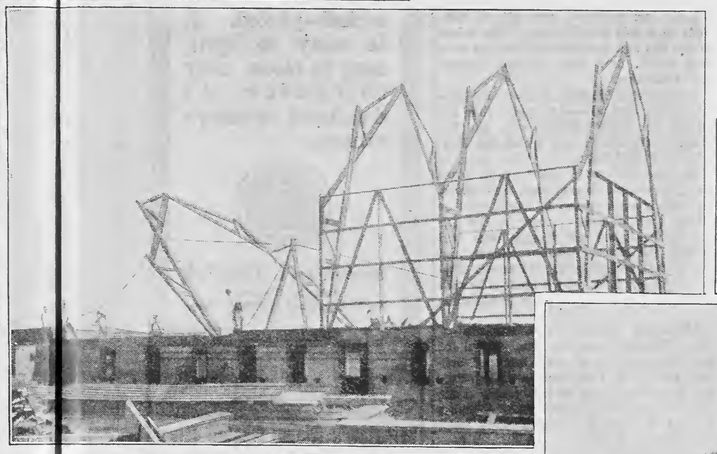
A JAMES planned barn, fitted with JAMES equipment, makes the ideal combination. But no matter whether you are ready to think about equipment or not, let us hear from you in the matter of barn building or remodeling. Tell us when you expect to begin work—how many cows you want to take care of—and the JAMES Barn Plan Service will begin going to you right away. This will give you time to think the matter over—to study what we send you. It will *start* you right, and you need have no fears regarding *success* and *profits* if you accept the help that we are anxious to give you. When you need legal help you go to a good lawyer. When sick, you call in a skilled physician. Why not adopt the same principle when going into the proposition that means nearly *everything* to you from the standpoint of efficiency and profit? If you employ an architect, the JAMES Barn Plan Service will help him. The same is true if your carpenter puts up the barn without an architect's help.

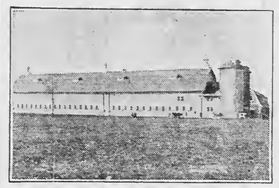
The Sure Way to Have a Good Barn

is to have it designed and equipped by experts who have had so many *barn successes* that they can't go wrong in helping you.

NO MAN can afford to be careless or indifferent in planning his new barn or remodeling the old one. A barn is too important a part of the dairy farmer's work to be given any less than the most *careful* attention throughout the process of building and fitting it for use. Instead of returning you a *profit*—as a *good* barn will—a barn that is not built right or that is incorrectly planned will probably lose money for the owner every day.

It's mighty hard to correct a mistake in a dairy barn that is supposed to provide the comfort, ventilation, light and convenience required. The one safe way is to *avoid* mistakes by putting the job in the hands of men who *know how.*

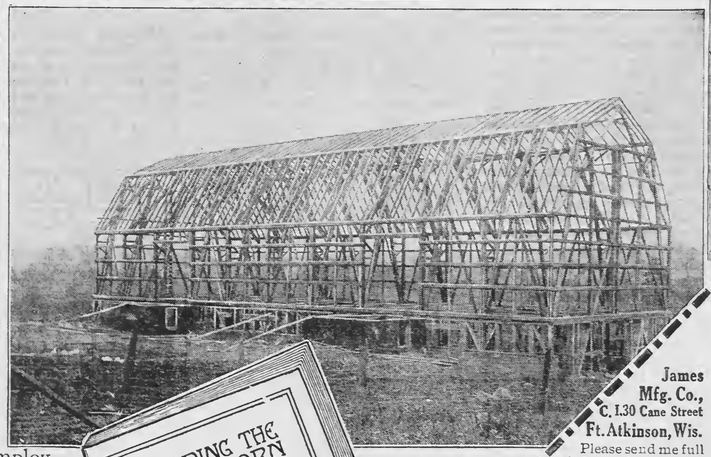




The James Manufacturing Company offers a Barn Plan Service that will help any dairy farmer—any contractor or builder—any architect—in the important work of getting the work *started* right and carrying it on to successful completion.

A barn planned the JAMES WAY will make money for the owner every day it is used. It will save time, labor and feed—increase the comfort of the cows and therefore increase their milk production—keep the cows healthier because of proper light and good ventilation—and make all the barn work easier.

You will be proud of a JAMES barn because of its good looks. It will add to the value of your farm. A list of improvements that includes a JAMES barn will always bring an extra price when the farm is traded or sold. A JAMES barn will not only make more money for you, make the work easier, and add to the value of the farm, but it will also add to the value of your herd. The cows show off better—and they *are* better, in every way. And please remember that a *profitable* barn—one that your neighbors will admire—costs no more than one that is filled with mistakes. It's just a case of getting the advice of men who *know* and applying that advice to your gain.



Snd Attached Coupon Today—NOW

Don't delay sending for this service. It costs you nothing—you will thank us later on for having urged you to write. *Do it today.*

Woman and the Home

From Day to Day

THE SHEPHERDS.

I.

IT was the shepherds of the fold
First heard the wondrous news,
What time upon the wintry wold
They watched their lambs and ewes.
It was the simple shepherd folk
First heard His angels sing,
When from the deeps of midnight broke
Resplendent plume and wing,
And hill and vale to music woke—
"All hail to Christ the King!"

II.

It was the lowly and the poor
That heard the tidings first,
When on the eyes of swain and boor
God's splendid angels burst.
It was the simple shepherds sped
To seek the Holy Child,
Who found Him in His manger bed
Beside His Mother mild,
While Joseph bent in awe his head
And on the Saviour smiled.

III.

Still, would ye seek His place of birth,
Go search in hut and cot!
Not with the proud or great of earth
He casts His kingly lot.
But 'mid the poor the Saviour seek;
There cradled low He lies.
He hideth still among earth's weak
From undiscerning eyes.
Yea, veileth still His Godhead meek
In simple human guise.

—P. J. Coleman in *The Columbiad.*

*

SOME of our friends, moved by the world-wide penury and distress now existing, tell us that they cannot conscientiously make any Christmas gifts this year. They feel that all they can spare must be devoted to the relief of actual distress, being distributed in what we call charity. There are foolish people whose Christmas giving is purely vanity and ostentation, but a great proportion of us do give, in spite of all that is said to the contrary, because we hope thereby to give happiness to those we love—it is our concrete example of "good will toward men." Those who give from vanity and greed are surely not likely to deny themselves for the needy, and even if they give up their Christmas presents it is not at all probable that they will be shorn of superfluities for the benefit of real sufferers at home or abroad.

As for the rest of us, perhaps we have already scraped together some offering of purest charity for the homeless women, the perishing children, who are the aftermath of pitiless war. We would all like to give more. What would it mean, to cut off our modest Christmas giving? Perhaps there are several young girls, to whom some sheer hand-embroidered handkerchiefs come as a touch of luxury in a drab workaday life. Well, they must do without this year—a thousand other women think the same, and across the Atlantic, a few hardworking girls in the Green Isle must do without an extra pound of tea, or jar of marmalade, that would have gladdened some needy one whose Yuletide cheer is stinted far below what we consider necessity in bountiful America. Again, a regiment of conscientious mothers decide that their little boys and girls must be denied certain longed-for Teddy bears and Billy possums and other friendly beasts that never came out of a menagerie. Trade falls off, and some forlorn little woman here in New York stands in line waiting for the charity order that will provide milk for the fretting baby, and shoes for the youngster who cannot go to school until his poor chilblained feet are taken off the bare pavement.

Some friend who knows all about Adam Smith and all those other powerful intellects who pile up figures may break in right here with a statement that personal extravagance cannot provide healthful trade; that luxuries, whether indulged in by rich or poor, merely divert money from commodities on which national prosperity is founded. This may be true of absolute senseless luxury, whether it means too many jewels for the rich, or too many moving picture shows for the poor. But the sudden cutting off of normal expenditure, unless real need compels it, means hard times for a great many industrious people.

This is going to be a thoughtful Christmas for many of us. We are the most prosperous nation in the world—yet poverty waits round the corner for many a one. Many of us are united by ties of blood or sympathy to the nations now ravaged by war. There never was a time when hope and cheer was more needed by a weary world. If we fail to brighten our own little corner of it—to make home the best place on earth, and family love and courage the best thing in it—how can we ask the world at large to listen once more to the songs of the Nativity, with its assurance of peace on earth, good will to men?

The Rural Patterns.

When ordering patterns give number of pattern and size desired. Price of each pattern, 10 cents.

8468, Dress with plaited tunic for misses or small women. For the 16 year size, the blouse and tunic will require 7½ yards of material 27, 5¾ yards 36,

4¾ yards 44 inches wide, with 1¾ yards of lining material 36 for upper part of skirt, 1¼ yards 27, three-quarters yard 36 or 44, for lower part of skirt and trimming. The width of the skirt at the lower edge is one yard and 24 inches. The pattern 8468 is cut in sizes for 16 and 18 years.

8385, Blouse with vest effect. Cut in sizes 34 to 40 bust measure. Size 38 requires 2½ yards of 36 inch material, with five-eighths yard 36 inch wide for vests, collar and cuffs. 8310, Plain

blouse. Cut in sizes 34 to 42 bust measure. Size 38 requires 2⅜ yards of 36 inch material. 8255, Semi-princesse dress for misses and small women, 14, 16 and 18 years. Size 16 requires 4½ yards of 36 inch material, with one-half yard 27 for collar and cuffs. 7736, Seven-gored skirt. Cut in sizes 22 to 32 waist measure. Size 28 requires 3¾ yards of 36 or 44 inch material. 8457, Three-piece skirt. Cut in sizes 24 to 32 waist measure. Size 28 requires 2⅝ yards of 44 inch material.

Seen in New York Shops.

A NEW military blouse has a shallow little yoke forming shoulder straps, a braid binding, and buttons with braid buttonholes. It has a high turnover stock and set-in sleeves gathered into turn-back cuffs. It is made in sand color chiffon broadcloth, and white or flesh washable satin.

Among the neck ruffs offered are some made of loops of wool yarn, white, black or brown. The loops come close together, and are quite suggestive of feathers; apparently they are made like the borders of some old-fashioned wool mats. They are finished at the ends with loops of satin ribbon. They cost about 75 cents to $1.25. In buying a neck ruff of marabou, be very careful about selecting black; we have never met with any that is "fast color." There may be such, but it is outside our experience; all that we have met with "crocks" badly, so that it soils light fabrics, gloves or the wearer's neck or hands, and saleswomen in good shops tell us it cannot be guaranteed. The natural marabou, dark brown, being nature's own dyeing, is absolutely "fast." For a black ruff maline, chiffon or ostrich feathers are always dependable, and the nice ones this season always have a lining of white.

Among Christmas gifts for men were neat round boxes, each containing one silk crocheted tie, one handkerchief with a deep hem to match the tie, a pair of cuff links and a stickpin of rolled gold. The articles separately are 25 cents each, but the set combined was offered complete in a sale for 50 cents. The colors in the ties and handkerchief borders were dark green, dark blue, brown, crimson and heliotrope.

Very pretty Turkish slippers for bedroom wear cost 50 cents a pair; they are of soft kid, with a double sole, and are made in Constantinople, which the Russians now call Tsargrad. They come in pink, blue, both pale and a bright royal blue, heliotrope, fawn, black and white. The toe is embroidered in tinsel, gold or silver, with a large pompon at the instep. They look as though they had walked out of the Arabian Nights, and would delight any girl. Bathroom slippers of terry cloth, just a stout sole with a toe-piece, are also 50 cents in all sizes.

MOLASSES CANDY.—Two cupfuls of New Orleans molasses, one cupful of granulated sugar, a small lump of butter; boil until it hardens in cold water, add a tablespoonful of vinegar, a scant half teaspoonful of bicarbonate of soda; pour into shallow buttered pans until cool enough to pull.

CHANDLEE & CHANDLEE, Patent Atty's
Established 16 Years
957 F. Street, Washington, D. C.

In the Warm Heart of the West.

PART II.

"I don't suppose there is a turkey within a thousand miles," Mrs. Lonesome averred, a little wave of discouragement sweeping over her.

"No, there isn't, but there are other things just as good. There are prairie chickens, grouse, wild ducks and jack rabbits everywhere, and with a spare rib or two we can make out," declared Mrs. Sweet.

Each family was allotted to bring for the Christmas feast just that which was most convenient to bring, and the feast lacked nothing in quantity nor quality, although some of the seemingly essential Christmas things were lacking. There were pumpkin pies made without eggs, baked fresh on Christmas morning; there was Scotch short bread wonderful for richness and quality, a great cornmeal loaf was steamed over night on Mrs. Patterson's kitchen range, potatoes cooked to flakiness and beaten to a cream and frothy whiteness were furnished by Mrs. Jamison, while various meats, cakes, puddings, etc., came flooding in from all directions. Each one had been allotted to bring a single viand. Instead of that, each brought several, and each one had let herself out to the full limit, to supply some one thing in which she especially excelled. The cost of the feast for each was really no more than a reasonable dinner for her whole family would have been, and the joy of being together, of having the spirit of belonging, was more than all else.

But this is getting ahead of things. The Christmas tree, wonderful in proportions, was decked out in an array never before dreamed of, in any human philosophy. Real candles blazed and spluttered amidst the festive branches of the tree, and the very fact of the alum-crystallized tumbleweeds was an insurance against fire, for alum will not burn to a blaze, anywhere. To be sure only a part of the wonderful tumbleweeds, which were literally small trees in themselves, were crystallized, because the alum didn't hold out, but the candles were located in amongst the crystals, and if they were few, they lit that magical tree to beauty, in the eyes of all beholders. The other tumbleweeds were taken frost damp and dipped in flour, and they presented the appearance of hoar frost itself, caught and kept in spite of blazing fires. The supply of gifts was such that the tree could hardly hold a minor share of them, and the piles beneath the tree were astounding in size, in shape and in the mystical wonder they held. Strings of popcorn were of course draped about the tree, paper flowers glowed where they would do the most good, and one skilful worker had taken some blue clay which had been thrown up by well workers, and molded this into a very good angel shape indeed. It was a marvel of skill, all declared, and when this had been dried and rolled in flour, with a gilt star in a crown, it was placed in the very top of the unique Christmas tree, where it spread its white wings in blessing to all.

The gifts were homely, it is true, but never a "duty" gift held a hundredth part of the delight those simple home-made things did. Children rejoiced in new garments made from old. Little Timmy Smith was immediately dressed in the new trousers supplied by Mrs. Sweet, and sundry and divers other children gloried in the outgrown garments of sundry and divers other children. The old garments had been refurnished and made to look as spick and span as could be. Some were stiff with starch and ironed to immaculateness, while others were pressed into soft folds, that held a weight of love unspeakable. One inventive genius had colored beans and strung them into marvelous necklaces, and hardly a woman or girl there who was not beaded to beauty on that glowing Christmas Eve, out underneath the stars of the low hanging heaven of the plains! The Mother-to-be was furnished forth with a complete outfit, subtracted from things left over, from the stores of the Mothers-who-had-been.

It was, altogether the homeliest Christmas that ever could have been, and yet it was the most joyful, for even the ones who were not "congenial," who were "grouchy," who were "beyond the pale," were gathered into the lovewarmth of the West, and the Child born to that community, the Child of Love, lives on through all the changing years, and time and space has never separated the hearts joined in that holy bond of union forged by the harsh hand of hardship and loss, welded by the hammer of a Fate which had separated them from their own kin, on the anvil of the Christmas thought in the heart of one woman of the plains.

Today the Christmas trees are shipped in by carloads, and the poorest may have a home tree, while cummunity Christmas trees bloom in beauty in the public squares in the plains cities, that all may share the Christmas spirit. Today the churches with light and music, with sparkle of tinsel, and glamor of Christmas goodies, are open to all who will rest for a Christmas hour beneath their arches. Hands have hardened on the plains, eyes have dimmed, and many lives have gone on to a further and better growth beyond the pale of earthly hopes, but the warmth of the West, the heart of the Plains, still broods over all, for "Unto us a Child is born," which has saved us from ourselves!

ROSE SEELYE-MILLER.

To Keep Cider Sweet.

APROPOS of cider keeping, perhaps a little experience will be helpful. Two years ago, the writer visited a farm where cider was plenty. When I left the place a can of so-called boiled cider was given me for use in mince pies. Various things prevented the use of this cider, until it had been kept two years. On opening the can, it was found to be perfectly sweet and tasted almost like fresh cider. The way this was preserved was merely to boil it down one-half, and can it hot as any fruit is canned. For drinking it is fine, and may be reduced as much as it was boiled down if desired. This cider preserved this way is not at all like the old-fashioned boiled cider, which was boiled until like a syrup, in fact the heavier boiled cider is much better for mince pies and such things, but the cider boiled down half with no preservatives added makes a delicious drink, which seems to keep almost indefinitely. The cider must be used before the slightest fermentation takes place, as a little fermentation is apt to prevent the keeping qualities, but cider fresh from the mill can be kept this way.

R. S. M.

Chutney Sauce.

WILL you kindly repeat formula for apple catsup given in your columns a short while ago? MRS. C. L. L.

We gave a recipe for grape catsup recently, but do not recall any recipe for apple catsup, nor are we able to find this in our cook books. Chutney contains apples; this is an old but highly esteemed English recipe, adapted from an Indian formula; it is much appreciated by those who like a hot relish, as it is very peppery:

Chutney.—Eight ounces of tart apples, peeled and cored, eight ounces of peeled tomatoes, eight ounces brown sugar, eight ounces salt, four ounces powdered ginger, four ounces red peppers, two ounces shallots (or onion), two ounces garlic. Pound all together in a mortar (or pass through a chopper set to cut fine) and then put all the materials together in a jar with 2½ pints good vinegar. Place the jar in a warm place, covered, for one month, stirring with a wooden spoon twice every day. At the end of the time pass the chutney through a sieve, and bottle, when it is ready for use. The intense heat of the peppers grows milder with keeping, and the chutney improves and becomes richer in flavor.

EVERTON TOFFEE.—Put one pound of powdered sugar and one teacupful of cold water into a saucepan; when the sugar is dissolved add a quarter of a pound of butter beaten to a cream. Keep stirring the mixture over the fire until it hardens when a little is dropped upon a buttered dish. Just before the toffee is done add a half teaspoonful of lemon flavoring, and pour into a shallow buttered pan to cool. This is a popular English candy.

Cook your whole meal at one time in the

Live Stock and Dairy

MODEL DAIRY BARN.

FIGS. 630 and 631 show a New York State barn which is considered by the farmers in the neighborhood as an ideal one for a 120-acre farm. As shown by the lay-out, it has stanchions for 34 cows with two box stalls which can be used for calves, or cows when calving, The stable is equipped with modern swing stanchions and water buckets between every two cows. The rows of cows face each other, which is the most convenient arrangement for feeding; the manure carrier runs on track behind each row of cows and is dumped directly into the manure spreader in barnyard.

It will be noted that the feed room is most conveniently located for feeding both horses and cows. The silo opens into the alley at the other end of barn and the hay comes from above directly in front of the cows. A block and tackle is used to hoist the feed into the bins above the feed room.

This main barn has cement floors throughout, the cement floor being planked over for the horse stalls only. This plan of barn with variations to suit individual requirements might well be taken as a model by those having building problems to solve. W. D.

Breeders Have Greater Weight than Breed.

"WHICH breed is best?" This question was put to Holstein, Jersey, Guernsey, Ayrshire, and Brown Swiss men at the National Dairy Show. A stock answer which came from unprejudiced men was: "They are all good." One Holstein man declared: "It is little difference whether you keep Holsteins or Jerseys, Guernseys or Ayrshires, or Swiss as far as the man himself is concerned, but the man who tries to keep one breed when his market demands the product of another breed, is in a situation which may run the milk producer aground in the dairy business. A man must be in harmony with public sentiment, and in our town it was for Jersey milk. No other milk would be considered in the local trade, but we now have several good Holstein herds of wide reputation for breeding in the city limits, and by breeding for butterfat, we have turned sentiment in favor of our breed. It took time, and the advertising of our herds, sales of our stock and our annual sales, were indirect advertising which turned people our way. Our city papers gave our pure-bred activities frequent mention and our milk has become equally popular with that of the Island cattle. A man with less money starting in the dairy business should secure cows noted for richness of cream, if this is demanded in his locality, and if any particularly breed is favored he should make that his choice. He cannot afford to attempt to divert public sentiment in favor of his chosen breed."

Another prominent dairyman said: "I would take a rough cow census. If the locality in which I would engage in the business might be a center in which great cows of a certain breed were developed, and sires of note were produced, that would be the breed I would keep, even though I might have some prejudice in favor of some other breed. If I found that Guernseys were popular cows in the community, and that people were developing them as grade herds I would go with the crowd. There is nothing in it for the man who stands alone championing a breed altogether different from that one adopted by his community. Holstein buyers will ignore his Island stock, while they pick up car lots among his neighbors. The lonely breeder is out of the game when it comes to hold a live stock sale of the predominant breed in his locality. If he should attempt to keep Guernseys in a Holstein center, he would be losing a vast amount of valuable advertising which his locality has acquired for its favorites."

From another source came the suggestion: "The progressive policy of the breed in which I might be interested, would have some weight in my choosing or rejecting it. I would consider the possibility of whether or not the breed is backed by aggressive officers and members, and I would carefully consider the activities of the breed association in popularizing the animals I had under consideration." W. J.

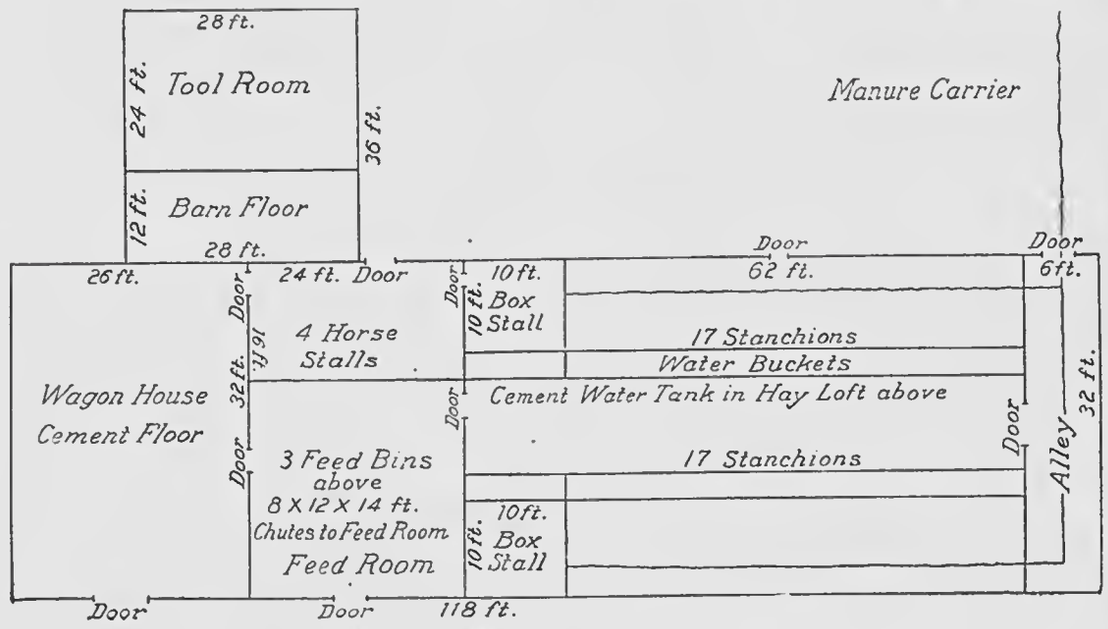
FEEDING PROBLEMS.

Ration for Heifers.

I WOULD like a feeding ration made from rough hay worth $10 a ton, oil meal and cottonseed meal $1.65 per cwt., hominy $1.40, corn $1.60. leaving out the corn if you can or using instead of hominy and would like to know difference if good Timothy is used at $15 a ton or even bought Alfalfa at $21 to $22. This is for heifers. F. W. K.

Ohio.

For a grain ration to use with the rough hay give a mixture of three parts



GROUND PLAN OF MODEL DAIRY BARN. FIG. 630.

by weight of hominy feed, two parts bran and two parts oil meal. I do not know just exactly what your rough hay is, but if it consists of wild grasses cut in good condition it is probably cheaper than Timothy at $15 per ton. If the Alfalfa is of good quality and well cured it is probably about an even thing whether you use Alfalfa or the rough hay at the prices quoted. In feeding Alfalfa leave out the oil meal from the grain ration. Feed three to five pounds of grain daily. C. L. M.

Ration for Butter Making.

WILL you balance a ration for dairy cows, grade Holsteins? I am feeding, for roughage, about 10 pounds corn stover at morning, 10 pounds hay (mixed Timothy) noon, one bushel corn silage at night. For grain I have corn and cob meal, oats, barley and buckwheat; can buy nearly any commercial feedstuff in this locality. I am making butter. C. E. W.

A good grain ration to feed with the above roughage would be four pounds cottonseed meal or oil meal, two pounds corn and cob meal, and one pound each of ground oats and barley. C. L. M.

Ration for Dairy.

WILL you give me a balanced ration for cows? I have oat and pea hay, but it was very rainy at the time it was ready to be cut, and it is matured more than desirable. I have about 15 tons of good mixed hay, about 140 tons of silage, not matured and cared lightly; the ears were in the dough when put in the silo. I pay the following prices per 100 pounds: Ground oats $1.90; meal $1.90; bran $1.50; union feed $1.90; middlings $1.55; mixed feed $1.65; cottonseed $1.80; gluten $1.75; oil meal $1.90; hominy $1.80. I can also get dried brewers' grain or distillers' grain at about these prices. These cows are all grade Guernseys weighing from 800 to 1,000 pounds. I have been feeding a mixture of bran, middlings, gluten, hominy, oil meal, cottonseed and union feed; this has worked well with soiling, but since I began to feed silage and oats or hay they have shrunk. F. P. W.

Connecticut.

Your trouble is not unusual at this time of year when it is necessary to change from soiling crops onto a Winter ration containing less succulence and more indigestible fiber. The grain ration which you are feeding your cows should produce good results, but there is not much milk in over-ripe hay and silage made from poorly-eared corn. To make the best silage the corn should be well eared and just beginning to glaze. When put into the silo in this condition and properly packed it furnishes one of the best Winter feeds for milk production. It has been found, however, that by the addition of about four pounds of dried beet pulp, soaked with all the water it will absorb at least eight hours before feeding, and mixed with the grain ration just before feeding time, the milk flow can be materially increased. Whether it will pay to go to the extra expense or not must be determined by each person individually as circumstances and conditions may seem to warrant. Under ordinary conditions, if it pays to feed a cow at all it pays to feed her well, and if by adding the beet pulp you can decrease the amounts of some of the other equally expensive feeds somewhat it is reasonable to expect that this change would prove to be profitable. C. S. G.

Many of our readers appear interested in building pit silos. As we all know, a pit silo is a hole in the ground plastered or bricked up and then filled with chopped corn or other crops, the same as any other silo. In some parts of the country these pits are quite satisfactory, but the ground has to be dry, with a low water level, in order to make them worth while. The North Dakota Farmers' Institute No. 3 for March, 1914, has issued a very good bulletin on this pit silo. There are plenty of pictures and a very sensible statement of conditions. It is published at Fargo, N. D., and is an interesting pamphlet for those who want to know about the subject.

250,000 Cows Milked This Way Daily

Here is the Milker that will milk your cows at the rate of 20 to 25 an hour with the aid of one man—and do the work satisfactory.

The Hinman Milker

will cost you only $50 a unit including the vacuum pump; a 3-unit outfit, $225 complete aside from power. This price is made possible by our being able to build 100 machines a day.

The *Hinman* has been in daily use for over six years and today is used by many of the best known dairymen in the U. S. and Canada. 15,000 *Hinman Milkers* are now earning for their owners from 50% to 150% yearly on their original investment.

A 5-unit outfit requires only 1 H. P. to operate it. The up-keep of each unit averages about $1.50 per year. All parts are interchangeable and can be secured at any of our branch houses. Our service is complete. Let us mail you our free book **"Making More Money With the *Hinman Milker*."**

Large Guernsey Record.

THE Guernsey breed not only has the greatest butterfat producing cow in the world, based on a yearly official record basis, but the general trend of the records of all cows running for the Advanced Register continues upward. On the last list of 25 cows, to finish a yearly record, there appear 10 cows whose records show a butterfat production of over 500 pounds. Only two of the cows show less than 400 pounds of fat, the lowest record being 333.67, a two-year-old heifer with first calf. Of the 10 records of over 500 pounds of fat, one is 825.90 pounds of fat, another 770.38 pounds of fat another 746.56 pounds of fat; three were between 600 and 700 pounds of fat and five between 500 and 600 pounds of fat. These records are not picked or sorted in any way, but represent the last 25 cows to complete records regardless of age or size of the record, and is an indication of the trend in the Advanced Register work of the Guernsey breed. WM. H. CALDWELL, SEC'Y.

The Lady Hog.

AN advertisement like the following has been appearing in the Sunday papers:

BUY A LADY HOG!
LET HER WORK FOR YOU!

We will care for, feed and breed her for half the profits. You will make big money on her children, grandchildren and great-grandchildren.

$5 OR MORE STARTS YOU!
WE RAISE YOU HOGS ON OUR RANCHES.

The proposition seems to be for you to put up $5. That is the one sure thing about it. The next surest thing is that you are most likely to lose the $5 and the lady hog as well. Too bad that the boomers have taken up Mrs. Brood Sow. She is a lady, and has rooted out many a farm mortgage and grunted many a boy and girl through college. She needs good society and personal care to do this. Boomers and blowhards and exploiters ought to let her alone.

Never Use a Scrub Boar.

THE difference measured in dollars and cents is the difference between profitable and unprofitable pork production. Here is an example. There are two sows on the farm. One is a race horse type of nondescript ancestry. The other is a grade Chester White sow. The second animal is quite typical of the breed, is an easy keeper and a good mother. The first sow was taken to a purebred Chester White boar, the second sow, the better one, to a nondescript boar, inferior in size, and although the owner said it had some grade breeding, its progeny challenges the statement. There are three weeks difference in the ages of the litters. Six pigs from each litter are now on the farm. The older litter is about 11 weeks old. Each litter is now eating the same amount of feed, the older is uniform in size, typical of breed, and easy keepers. They evidence prepotency in the sire. The younger pigs are small, seem to be at a standstill, will weigh one-third less than the older ones, and are making unsatisfactory and unprofitable growth. At the present time there is at least $12 difference in value of the pigs, and $10 can be charged to the poor boar. The difference in the two litters matured would more than maintain a purebred sire on the farm a year. It also shows the value of the purebred sire over the scrub, and in this case the purebred sire cannot be figured at half the drove; it is more nearly 90%. J.

Hot Water and Dressed Hogs.

I NOTE that the cold water cure for scalding hogs has begun the rounds for another season. The writer has attended hog dressings for over 50 years and has yet to see the time that the water was too hot, provided the men were not afraid to move that were on the job, but I have often heard of its being set when in fact it was frozen on, for it is possible to draw a hog from a hot tub onto a platform made of icy plank and move so slowly that the hair will set when a little well directed motion would have left two-thirds of the hair in the tub and a well-dressed hog on the hooks. Therefore my advice is, do not be afraid your water will be too hot, don't be afraid, but willing to work, and don't chase the cider barrel after you get the hog in the tub, but stay on the job and work is the advice of one who has dressed nine hogs before breakfast, with a helper. GEO. L. GORDON.

Potatoes for Hogs.

COULD you tell me the value of potatoes at 35 cents per bushel compared with cornmeal at $1.65 per 100 pounds for feed to hogs weighing 150 pounds? What are potatoes worth for feed for small pigs six or eight weeks old? T. T.

New York.

The feeding value of roots, potatoes, etc., is not large, except for their value as succulence. Potatoes contain approximately 21 per cent. of dry matter, of which the greater part is starch. One hundred pounds of potatoes contain about one pound of digestible protein and 16 pounds of carbohydrates. The same amount of corn contains eight pounds digestible protein and 76 pounds carbohydrates or about eight times the digestible nutrients of potatoes. This would make potatoes worth 21 cents per hundred pounds, as compared with corn at $1.65 per cwt., or possibly 15 cents per bushel. However, as an entire ration, a hog could not consume enough potatoes, on account of their bulk and water content, to make a very rapid growth. Young pigs would not thrive on potatoes unless they were cooked, and then half of their ration should consist of concentrates. Four parts middlings and one part each of cornmeal and oil meal makes a good mixture for young pigs. Cooked potatoes are said to be worth four to five cents a bushel more than raw ones for hogs. A few potatoes, to feed in connection with cornmeal, would be worth much more than the value of their nutrients, because of their aid to digestion. Cornmeal alone is a pretty heavy feed, and if fed for a long time is apt to get a hog's digestion out of order. A bulky feed like potatoes, however, keeps the bowel movement free and the digestion and appetite good.

The same rules apply to the feeding of potatoes and roots to cattle and other stock. As an aid to digestion to stock having only dry roughage a small quantity is quite valuable, though the nutrients they contain may not in themselves be worth the price. As a sole ration they would be altogether too sloppy for horses, cattle or sheep, as well as deficient in nutrients. C. L. M.

Sheep and Belgian Hares.

E. R. S.'s idea, page 1338, of curing mutton is not practical, as anyone living where live sheep are obtainable can get a fresh supply at any time. As for the small farmer or villager keeping a few head, impossible. They must have a large range that is expensively fenced, or competent herders with well-trained dogs; while the eastern owner with a small flock, must ever keep in mind, the well-known sign, "Beware of the dog." The Belgian hare was "boomed" about 16 years ago by unscrupulous persons who made money by spreading broadcast untrue records of the hares' achievements. They then sold for a big price, mongrel rabbits; many of them diseased. The result has keen a "black eye" for the Belgian hare, which the animal does not deserve. But since the price of meat has been soaring, hundreds of people with the "safety first" idea are purchasing breeding stock and I can say, with five years' experience, that another meat animal added to the farm or village home, which will produce such excellent meat as quickly and as cheaply as the Belgian hare, should not be overlooked by anyone, with the few simple requisites at hand for keeping them. P. F. WOODWORTH.

Massachusetts.

IT is reported that a few days ago eight rabbits and 14 guinea pigs were stolen from the Pasteur Laboratories in New York City. These animals were kept for experiment purposes, for testing the effects of various diseases, such as cancer, tuberculosis, or hydrophobia. The rabbits and pigs were stolen and sold to saloon keepers, in exchange for liquor. Happily, as it turned out, none of these animals have been inoculated with the germs of hydrophobia, although they might have easily been, and in this way the disease might have been scattered through the city.

CUSTOMER: "Have you any more of that butter like I got from you last week?" Grocer: "Yes, madam." Customer: "Then give me a pound of another kind."—Boston Evening Transcript.

Dept. Y, Cortland, N. Y. *Bell Phone 14-F. 5.*

DON'T TAKE CHANCES WITH FOOT AND MOUTH DISEASE

Cortland County is clean and hasn't had even a suspicious case. We furnish certificate of health and tuberculin test 300 high-grade Holsteins in our herd. Write for prices.

F. P. SAUNDERS & SON
Springdale Farm, - Cortland, N. Y.

Purebred Registered
HOLSTEIN CATTLE

Here's growth. In 1871 the pioneers of this association held a meeting attended by six people. This year 389 members were present, and 2,864 were represented by proxies. The total membership to May 1, 1914, was 6,500—an increase of 1,107 members (or 17 per cent.) during the year. Since 1909 the registration of Holstein cattle has almost tripled, their average value as shown by average prices at auction has increased nearly $100 per head. This remarkable showing has been made on the absolute demonstrated merit of the breed.

Immune Berkshires
both sexes, all ages, best of blood lines, good individuals. Our sale in August averaged higher than any sale held in the East this year. Breeding and quality did it. We have just purchased of Lucas and Gill, Huntland, Tenn., one of the best herds in the South. It includes their show herd that won first and Championship at Nashville, Tenn., this fall. Get your name in early for our February sale catalogue.
White Horse Farms, Paoli, Chester County, Pa.

THE "HOT-AIR ARTIST" TALKS.

THERE is one thing we have missed this Summer, and as Winter is approaching we miss it more. That is the effusions from your Madison County, N. Y., hot-air artist. Is he dead, or only sleeping? G. L. G.
Connecticut.

"Hot-air artist!" Now I wonder if our friend knew what a compliment he was paying me when he gave me that name? When I was a very small boy I went to the town fair with my grandfather, and saw a balloon go up for the first time.

"What makes it go up, Grandpa?"

"Hot air. Just plain hot air, my boy. You see when air gets hot, it expands and becomes lighter. So the cool, heavy air crowds under it, and pushes it up. If it were not for hot air we could not live, for the air that we breathe out is impure and if it all stayed down near the earth, after a while it would get so impure that we would be poisoned. But, fortunately, it is warm when we expel it, and it goes up out of the way."

So hot air produces circulation, and if there is any one thing that a newspaper needs, that is it. But, to be serious, "hot air" is not so harmful in a discussion. It sometimes starts the circulation of thought, and then passes harmlessly up out of the way. I have not been sleeping all of the past Summer and Fall, and during some of my waking moments, I have put another cow through an official test. And, by the way, I believe that there would be a great many more cows with good official records if their owners were awake when the cow was ready to be tested.

I believe that an erroneous impression exists (hot air if you please) that a cow must go through an elaborate course of preparation before she can make a creditable test. My cow ran in the pasture right up to calving, and I believe that she was healthier, and therefore got fatter than she would have done if shut up in the stable. "You can't feed fat into milk." (More hot air.) I think we will all agree that when a cow is in good flesh we cannot increase the fat in her milk by feeding. But there is not the slightest doubt that a fat cow will give richer milk than she will if she be poor.

This particular cow (a Holstein) never was a very deep milker, and if I did not use the Babcock tester, I should never have suspected that she would make over three pounds of butter in a day. I was surprised to find that a sample of her milk tested 4.8% fat, and began inquiring as to who was testing in the vicinity. I finally got her in at a place six miles from home, leading her there in the morning, when she was milked out at noon and immediately started on test. Now, here is where your big docile Holstein puts it over the Jersey. Instead of trying to bellow her head off and work herself into nervous prostration because she was away from home, Miss Holstein says: "Why, there seems to be plenty to eat right here. And here is a bucket of water right handy; might as well get busy." So this cow started right out giving 57 pounds of milk a day, testing on an average of 4.6%. How about that old "hot-air" gag that a cow must be kept absolutely quiet, and that only her regular attendant must go near her?

Then, again, this cow was not blanketed and sweated to make her temperature go up, and her fat go out in the milk. On the contrary, the stable was kept so cool that the man in charge complained of the cold.

I think that John Gould of Ohio was father of that extra choice bit of "hot air" that "A cow gets all the exercise she needs chewing her cud." Yet these cows were turned out for exercise every morning, and an attendant kept them continuously moving about the yard.

The cow finally gave 395 pounds of milk testing 22.85 lbs. butter in seven days. Not a big test, but a whole lot better than no record. If she had remained at home, if I could have fed and milked her right along, and I had known just exactly what and how much to feed her, she would, in all probability, have made a better record. But, really, I don't believe that she would have done so much better as some would have us believe.

Now after the "hot air" has risen and blown away from this "effusion" I hope the impression will remain that any man of ordinary judgment can keep a herd of purebred cattle and get good records on a fair share of them if he will not sleep all Summer. J. GRANT MORSE.

Cistern for Barn,

I HAVE 30 head of young stock and think we will have to build a cistern at the barn. About how big should it be, so when filled it would supply them for a couple of months anyway? Would you build round or square? About the inside, does stonework have to be laid and cemented, or could a wooden form be used and cement poured in directly against the earth? What proportion cement and sand, and how much cement would it require? My stock range from yearlings to 2½ years old. How would a cistern be finished over the top for absolute safety, and would it have to be larger on the top than bottom?
Carmel, N. Y. O. V. S.

A cow requires about 12 gallons of water daily, young stock proportionately less. With these figures as a basis, the approximate size of a cistern required to supply a given number of head may be estimated. The frequency with which the supply can be replenished from rains, or other sources, will need to be taken into account and no exact figures can be given. Cisterns may be either round or square, the former shape being somewhat preferable. In either case, an interior form of wood is built and the sides of the excavation are depended upon for the outer form, except in those cases where the soil is of such loose nature that it will not stand. No stone wall is needed where the cistern is built of concrete, and a good proportion for this latter is one part cement, two parts sand and four parts clean gravel or crushed stone; the mixture to be of such consistency as to pour readily. The interior should be finished with a one to two coat of cement mortar. Walls should be at least eight inches thick and, in large cisterns, reinforced with wire or iron rods. Round cisterns may have a cone-shaped top, if desired, the cone to be built over a form of wet sand, and either form of cistern may be covered with a six-inch concrete slab built over a temporary floor of planks so arranged as to cover the cistern and to be removable from the inside, access being gained through a man-hole left in the cover. This concrete cover should be reinforced with heavy wire netting, such as wire fencing, or with iron rods or bars. To ascertain the amount of cement required for the cistern walls and cover, figure out the number of cubic yards in them and allow one and a half barrels of cement to each cubic yard when mixed in the proportions above given. M. B. D.

AILING ANIMALS.

Lameness.

I HAVE a horse that is lame in his shoulder, evidently of long standing. He has been confined most of the time for four months and treated with various liniments but without improvement. In walking he does not bring this foot as far forward as he does the other. What can I do for him? G. H. T.
Connecticut.

We cannot diagnose a mysterious case of lameness without making an examination, but it is quite possible that the shoulder is not the seat of the lameness. If the horse thrusts the foot forward when standing at rest the foot is the seat of the lameness, and we should clip off the hair and blister the coronet (hoofhead) with a cantharidine blister applied two or three times, if necessary, at intervals of two or three weeks. If the horse stands down square on his foot when at rest the shoulder more likely is the seat of the lameness, and you might clip the hair from the shoulder muscles and shoulder joint and blister there.

Garget.

CAN you help me in any way to find out the cause for condition of my cows? They have garget when they are about dry. When they are absolutely dry their udders will swell and give a few spoonfuls of ropy milk. Last Winter they gave a good supply of milk. I made as high as 275 quarts in a day from 15 cows. I fed a well-balanced ration with corn stalks and hay. The past Summer they were fed a small quantity of feed and on pasture, as flow of milk would stop. I gradually stopped feeding. One of these cows has just calved with a fine large calf, and only gives a few quarts of milk; last year gave at least 25 quarts a day. A. P. B.

The cows were not properly "dried off." Milk continued to form after you stopped milking and the milk soured, clotted and caused the swelling or garget. When you wish to dry off a cow put her on a spare pasture and do not give any other feed. Milk her once a day at first and then every other day, leaving a little milk each time, but milking out clean at the slightest sign of inflammation. If the milk persists rub the udder twice daily with a mixture of equal parts of camphorated oil and fluid extract of belladonna leaves. The cow that is not milking well now should not again be bred, as she has had garget.

Stocked Legs.

I HAVE a driving mare 12 years old, weight 1075 pounds, that gets swollen legs around fetlocks. What shall I do for her? For the last month she has sweated more than usual when driven. Seems to be a little out of condition. Coat does not seem right. I feed oats and mixed hay. G. D. S.
New York.

Indigestion apparently is present in the case you describe, as the mare sweats and has an unhealthy coat of hair, as well as the tendency to stocking of the legs when stabled. It is probable that you are feeding too heavily for the amount of work she does. Let her occupy a box stall when in the stable and bed with shavings or sawdust, if she eats straw litter. Do not let her stand a day idle in the stable. Reduce the feed and avoid new oats and new hay. Rub the legs dry each time she comes into the stable; then bandage from feet to knees and hocks. Allow free access to rock salt. Do not give any medicine. If the sweating continues clip the hair from her belly and from the legs above knees and hocks.

Fistula,

DOES fistula leave any injurious after effect on a horse, after being healed up? I am considering buying a five-year-old mare, which has had this trouble, but is otherwise sound. O. H. M.
Delaware.

If the fistula is perfectly healed and the part is not in any way sensitive when handled and not distorted so that it will interfere with proper fitting of the collar, the mare may be bought. A considerable reduction in price should be made on account of the blemish. If the mare has but recently recovered you will have to be more careful in your examination than if she has been well for a long time.

Pin Worms.

I HAVE two young horses troubled with pin worms. What is the treatment? S. J. S.
New York.

These worms inhabit the rectum, and are only injurious by causing irritation which induces tail rubbing. They may be destroyed by injecting two or three quarts of soapy warm water containing a cupful of strong tobacco decoction made by steeping tobacco leaves or stems in boiling water or use a decoction of one ounce of quassia chips to the quart of hot water. Give the injection at night and repeat three times at intervals of two days.

Feeding a Foal.

I HAVE a colt 5½ months old, weaned it two weeks ago. I now feed the colt one quart of wheat bran and three-quarters of a quart of oats dampened, three times a day, mornings and evenings. I did not turn him out much the past two weeks, but will turn him out more as soon as he gets more used to being alone. I noticed that he gets against the wall in the box stall and rubs his tail. What can I do to stop that? A. K.
New York.

Twice a day let the colt take all he cares to clean up of a mixture of equal parts of wheat bran and crushed oats, and gradually substitute whole oats. One has of course first to accustom a foal to such feed. He may also have sweet skim milk to drink, if you have it to spare; but watch that it does not cause scouring. Let him run out doors as much as possible and have free access to the best of hay, as well as grass. Feed carrots as a part ration in Winter and in cold weather he may have a little corn. Let the colt lick rock salt at will. Wash the root of the tail with salt water twice a week. If he continues to rub worms are the probable cause and we should mix in the feed twice daily for a week one heaping teaspoonful of a mixture of two parts salt and one part each of sulphur and dried sulphate of iron, then skip 10 days and repeat.

Colic.

WHAT is a good reliable colic remedy? The animal affected is a good work mare, but keeps thin. We raised our own corn for feed and have plenty of fodder. We also raised a lot of fodder for her, planted the corn after we dug our early potatoes. F. M.
New Jersey.

There are several kinds of colic, and no single remedy is suitable for all. On general principles it usually is safe to give two ounces of turpentine and one ounce of laudanum shaken up in a pint of raw linseed oil. In wind colic omit the laudanum and add a dram of fluid extract of nux vomica. It often is found necessary to tap a bloated horse by means of a trocar and canula.
A. S. A.

Poultry Questions.

I HAVE raised 50 pullets out of a flock of 100 chicks, White Wyandottes, which are just six months old. About what age should they begin to lay? How should chicks be fed to begin to lay early? I also wanted to raise around 1,000 pullets for laying this coming season; can you give me any information as to breeds, feed and housing, and where I could sell the roosters for broilers, alive if possible. Give me the amount of feed for each hen and the different things to feed at each meal. L. C. R.
Connecticut.

Wyandottes that have been well reared should begin laying at about five months of age though some of the more precocious ones will get an earlier start. To encourage early laying one should begin as soon as the chicks are hatched and feed and care for them in such way that they will make rapid and uninterrupted progress to maturity. To this end, a variety of broken and ground grains should be used and meat or skim-milk, or both, should be fed in generous amounts. Feeding which merely keeps chicks growing produces Spring layers. If you wish to raise 1,000 good pullets you should plan to set about 8,000 eggs. With a 50 to 60 per cent. hatch, something less than a 50 per cent mortality rate, and a pullet production of about one-half the total number of chicks, you could reasonably expect 1,000 desirable pullets in the Fall. The feeding and care of both sexes will be the same until the cockerels have reached a weight of from one and half to two pounds; they may then be sold as broilers through any commission house handling poultry products. To give full details of breeding, feeding, housing and marketing would require a good sized volume. You will find all these things discussed in these columns during the season and any questions that you wish to ask will be gladly answered. For your present flock a mash should be provided and the one used in the laying contest at the Storrs Experiment Station may be recommended. This is 200 pounds wheat bran, 100 pounds cornmeal, 100 pounds gluten feed, 100 pounds ground oats, 75 pounds wheat middlings, 30 pounds meat scrap, 30 pounds fish scrap and 25 pounds of low-grade flour. This is kept constantly before the fowls in open hoppers, being mixed and fed dry. Mixed whole grains are also fed in the litter and the Cornell formula is a good one; 60 pounds corn, 60 pounds wheat, 30 pounds oats and 30 pounds buckwheat. The whole grains are usually fed twice daily, giving about a handful to each fowl. No exact amount can be specified and it is not necessary to follow any formula exactly in mixing. The above are given as good examples of grain combinations, however. In addition, hens should have green food of some kind and grit, crushed oyster shells and perhaps charcoal should be available. An ample supply of water is essential. M. B. D.

Respiratory Trouble.

I AM losing my fowls; can you tell me what the trouble is, and how I can relieve it? The first symptom that I notice is that they gape like little chickens when they have the gapes, and gradually grow worse until their breathing is very difficult and causes a peculiar sound. They have red combs and look perfectly healthy. I examined their throats and there is no inflammation or soreness, but the windpipe is wide open and does not seem to close when they breathe.
Virginia. H. M. V.

There are certain forms of fungi which flourish in warm, damp, weather upon decaying vegetable matter and which are capable, when transferred to the mucous membranes of fowls, of establishing themselves there. These fungus growths may be found in various places along the respiratory tract, sometimes forming circular patches at the opening of the windpipe and choking the fowl very much as gape-worms do in that affection. It may be these patches which you see at the opening of the windpipes in the fowls which you have examined; if so, see if you can remove them by the gentle use of a sliver of wood or toothpick. The treatment is rather preventive than curative. The fowls should have dry quarters, free from musty, moldy, straw or other litter upon which these fungi live and from which they may be inhaled by the birds. If the fungi have found lodgement within the air passages, I know of no practicable measures for their removal. Strong, vigorous fowls are probably much better able to resist these infections than are those of less vitality.
M. B. D.

Open-front Henhouse.

I HAVE had an old chicken house remodeled. The house I speak of has three large windows in it. I am a believer in fresh air for chickens, the same as for human beings and therefore have had the windows removed and the opening covered with chicken wire. The house is equipped with drop boards with perches on top and nests underneath, to which the hen gains access through jumping up in the back. The thermometer often drops below zero in Rockland County, where I live. Friends are laughing at my plan and discouraging me, saying the hens will have frozen feet and will not lay all Winter. A curtain has been put over the perches for the Winter and a drop curtain outside over the opening where the windows were. My stock consists of 70 Plymouth Rocks, all March and April pullets. My intention was to house them all together as soon as the severe weather comes, placing hay and dried leaves for litter with plenty of scratch food. In the morning I feed them with hot mash of middlings, sometimes with scraps, then about 4 P. M. plain oats, or oats soaked in hot water. Is this enough food for chickens housed for the Winter? Will you give me a good mixture for a scratch food and let me know if cracked oyster shells are necessary? E. C. S.
Nanuet, N. Y.

If your remodeled house is wind-tight on all sides but the one with the windows, and is not so long that drafts are formed by the wind blowing through from one window to another, as it probably is not, your plan is a good one, and you will undoubtedly find that your fowls are far healthier and happier than those that your friends confine to tight houses. Be careful that the curtain over the perches does not make the space behind it too nearly airtight and you will probably have very few occasions to drop those over the outside openings. Feeding twice daily is sufficient but it is perhaps better to divide the grain into two feedings, morning and night, so as to induce more exercise while the fowls are hunting for it. If a moist mash is used, my preference would be to make the mid-day meal of it. A good grain ration, as recommended by the Cornell Station, is composed of 60 pounds wheat; 60 pounds corn; 30 pounds oats and 30 pounds buckwheat. Crushed oyster shells are needed unless an ample supply of lime from some other source is provided. M. B. D.

AILING ANIMALS.

Indigestion.

I HAVE a five-year-old colt, run down and very thin, does not seem to gain very fast. I am feeding four quarts three times a day of wheat bran and hominy, one-third wheat bran. Can you tell me what to feed to fatten her?
L. W. B.

Have the teeth attended to by a veterinarian, as it is possible that milk-tooth crowns have not come away and are preventing perfect mastication of feed. Such crowns should be removed and sharp points filed down. It is a mistake to feed ground feed. Feed whole oats and one-ninth part of wheat bran along with best mixed hay. As worms may be present give the filly one ounce of turpentine shaken up in a pint of raw linseed oil, after starving her for 10 hours. Twenty-four hours after the oil mixture has been administered mix in the feed night and morning for a week one tablespoonful of a mixture of equal parts of sulphate of iron, salt and sulphur; then skip 10 days and repeat.

Depraved Appetite.

WHAT is the trouble with my horse? He is a large horse and we feed him well, but if he has no hay to eat steadily all the time he starts to chew off the wood of his manger, and also pieces off any part of the stall he can reach. He chews on all the wood within reach. Is this some sickness? M. E. M.
New York.

The horse is doing too little work and eating too much feed. Work or exercise him daily and never let him stand for a single day idle in the stable. Allow him a roomy box stall when in the stable. Cover exposed manger and partition edges with tin or zinc. Allow free access to rock salt. If he eats his bedding use planing mill shavings or sawdust. Watch for worms in the manure. If they are seen, or if there is a fur of scaly substance around the anus, or streaks of mucus there, give him worm powders in his feed night and morning for a week, then skip 10 days and repeat. Let the powders consist of equal parts of dried sulphate of iron, sulphur and salt and the dose one tablespoonful.

Feeding Sweet Corn; Stumbling Horse.

OWING to the scarcity and low price of horse (field) corn and the abundance and low price of ripe sweet corn, many farmers hereabouts are feeding their horses on ears of sweet corn sprinkling same with salt. Is this a safe practice in your opinion? 2. One of my horses has developed a habit of stumbling and sometimes falling. At times his feet will simply slide from under him. He has been fed well and seems to be in pretty good physical condition. Someone has suggested a tonic. Is nux vomica a good tonic to build a horse up, and if so what is the usual dose when administered in form of powder? E. D. L. E.
New Jersey.

1. Immature sweet corn ears should form but a very small part of the ration for a horse. Fed in considerable quantities such feed will be likely to cause indigestion, or irritation of the skin. Fed suddenly it may cause severe colic. Corn is best fed in Winter, as it is a fat and heat former. Using sound, dry ear corn (field) as a part ration in Summer and Fall combine as follows: Whole oats, 10 parts; ear corn, six parts; wheat bran, three parts. A work horse will require of this one and one-fifth pounds to one and one-third pounds for each hundred pounds of body weight as a day's ration, according to the work he has to do. 2. Have the horse properly shod. Then work or abundantly exercise him every day. Feed plenty of sound, old whole oats. Prefer fluid extract of nux vomica to the powdered drug. Give one dram of it along with half an ounce of Fowler's solution of arsenic night and morning, after a few smaller preliminary doses have been given. Gradually discontinue the medicine as soon as it is not needed.

Weak Calf.

I HAVE a calf, half Jersey and half Holstein, three months old. For the past week she has been too weak to stand up to graze more than 15 minutes at a time, although she has a good appetite, looks healthy and shows no signs of sickness, only weakness. Since she has not been able to graze I have fed her on milk. I have had a veterinarian to treat this calf, but the results have not been satisfactory. Do you think worms are the cause and what would you suggest as a remedy? A. S. T.
Virginia.

The calf should have been well fed on milk and meals, instead of being allowed to graze. The paunch (rumen) of a young calf is not developed for the accommodation of much roughage, and it has to depend largely upon feed which can at once be cared for by the fourth stomach (abomasum) which is the true digestive stomach. The calf has practically been starved and may not recover. At once add to the milk, fed four times a day, a little blood meal and flaxseed jelly, and also allow the calf free access to a mixture of oatmeal, bran and flaxseed meal, or feed calf meal with the milk. A tablespoonful of emulsion of cod liver oil given twice daily would prove beneficial. Medicine is not needed.
A. S. A.

"MADAM, do you try to economize?" "I do." "This book will give you many valuable points. Only 50 cents." "I don't need any points. I'll just economize and save that 50 cents."—Credit Lost.

This Floor Outlasts The Barn

It's Made of Linwax Blocks

It keeps my cows and horses free from all the diseases and discomforts due to cold, hard, slippery concrete and unsanitary plank floors. It is forever guaranteed against rot and decay, chipping or scaling; slivering, splintering or disintegrating. It is sanitary, warm, restful, economical---warranted to outlast the building.

SANITARY LINWAX BARN FLOORING

is made of antiseptically treated hard wood---so tough and fine-grained that it will last practically forever. It is moisture and germ proofed and no germ can live near it. It disinfects.

Our Free Booklet explains how any farm hand can easily lay this floor, and tells other facts. Write for it today.

Linwax Manufacturing Co.

Cold Water for Bloated Cows.

ON page 1350, E. A. A. asks what he could have done for a calf that bloated. A few years ago my herd of cows came in from pasture one night all well, as far as anything I saw, when I put them in the stanchions. We had nicely started milking when I noticed that the cows near me were acting as if scared at something in front of them. The cows were in two rows facing each other. As I rose to see what the trouble was I heard a cow breathing hard and could see her as soon as I was on my feet with her head down, mouth open and tongue hanging out, while she struggled for breath and seemed about ready to fall. I unlatched the stanchion to let her out, but we couldn't move her. We looked her over and saw she was bloated. I called to my wife, who was out by the house and told her. She came out, looked at her and said: "I believe I would pour some cold water over her." We ran for water and poured pailful after pailful along the cow's back. In a little while she had closed her mouth and was breathing naturally; so we left her and went back to our milking. Pretty soon she backed out of the stanchion and walked out doors. When we finished milking we put her back in the barn, rubbed her partly dry, blanketed her and left her there over night. Next morning the bloat was gone and she was chewing her cud. After this one of our ewes had a lamb in cold weather, so we had to keep them in the barn. The lamb ate with its mother. It grew fast, was pretty greedy, ate more than was good for it and one day when I went out I found him bloated, lying on the floor evidently kicking his last. We gave him the cold water treatment same as we did the cow and it wasn't long before he was up eating again. Both these animals were too far gone to take medicine when found. They might perhaps have been relieved by tapping, but I hardly think it would have removed the cause like the cold water treatment. A. E. H.

Alfred, N. Y.

The Cow-tester Shows Up the Boarder in Iowa.

PETER Peterson of Iowa in four years increased the butter fat of each cow 134 pounds, at an annual expense of $1.50 the cow. Here is a concrete example of where the cow testing association pays. The fourth year of Mr. Peterson's membership in the association he had sufficient increase in butter fat production in his herd to warrant his paying for the service of the tester for the year. Mr. Peterson was not the only man who profited, there were 26 other men. The average annual production of the association when established was not far from 145 pounds the head. Mr. Peterson and his associates were hard to convince of the advisability of paying $1.50 the head for the testing work. He and his neighbors believed they could tell the good cows in their herd, and believed they had practiced eliminating the boarder, as they called the unproductive cow. However the tester showed some grand surprises. Deceptive cows heretofore had survived the block, while, probably, others had produced a bad impression and were sent to the butcher.

Mr. Peterson's brother is one of the members of the association, and he recently decided to sell his grades. His herd numbered 25 cows and 25 heifers, and the cows at the sale averaged $134 a head, which was from $40 to $50 over and above the average value of the mature stock at the time of his entering the association. A buyer of grade stock was at the sale from one of the prominent dairy sections of the State. He paid $90 the head for grade two-year-olds from the tested dams, which was $15 a head more than he was paying for same stock from untested grade herds. In all the second Mr. Peterson profited in his sale, by increase in value of animals, more than enough to pay the tester for two years, while his increased production would easily have paid the tester for the remaining two years of the testing period.

Another saving which about paid the tester for the year has been that in the coöperative buying of feed. Over $700 was saved during the past year, or nearly $1.50 a cow, the cost of testing the animals. The organization of a testing association is simple. Twenty-six men get together, elect officers, figure up the number of cows, arrange for tester, his salary, and charge against each cow her proportion of the expense. The tester spends a day with each farmer, tests the individual cows, and goes the next day to another member in the organization, making the rounds each month. He keeps records of the cows, computes costs, advises in the matter of feeding, and is a dairy expert devoting his entire services to making the cow show up profit or get out of the race. Minnesota has a cow-testing association of over 5,000 dairy cows, the largest in the world.

W. J.

Dynamite for Woodchucks.

I HAVE read an article in "Fruit Grower and Farmer" which says that Mr. Budd suggests a method simple enough, and has nothing to do with blowing the animal to atoms (gophers). He says—take about an inch and a half or two inches of a stick of 40% extra-dynamite and enclose in a bit of rag or several thicknesses of paper; tie this about the end of a fuse 12 or 14 inches long, but do not use a cap. Insert the charge in the hole of the rodent as deep as possible and with a piece of stick pack the dirt around the fuse, leaving an end of the fuse sticking out so that it will light easily. Light the fuse; there will be no explosion, the dynamite will simply burn, throwing out a dense heavy black smoke, filling the hole with poisonous fumes that will kill every animal within. I have not tried this for this purpose: the method looks good to me. Dynamite, when a match is applied, or better and safer, fired with a fuse (without cap) will burn like celluloid, with a fierce flame, and throwing out a heavy black smoke, which I know to be poisonous, and in a confined space, such as a blocked hole, would be very apt to kill anything confined in the area of the hole. I think this method of clearing woodchuck holes would be very effective and am going to give it a practical trial at the first opportunity. Of course it could not be used in a barn or house to eradicate the rats and mice, owing to the flame—but bisulphide can.

My experience is that bisulphide of carbon, put on a pad of absorbent cotton and then put in the hole, the hole being closed, will effectually dispose of Mr. Woodchuck. It is good, of course, for moles, rats, mice, muskrats, etc. I recall one instance particularly where a long stretch of dike has been freed of muskrat; there was great danger of the dike breaking. Dynamite, of course, could not have been used, but the bisulphide was and we entirely cleared them out. I have used this treatment many times, and got results every time.

Pennsylvania. H. S. J. BRADY.

SULPHURIZING WOODCHUCKS.—Some years ago I had good success killing woodchucks (in Summer) with the following: Equal parts gunpowder and sulphur mixed well and wrapped in paper packages of about a tablespoonful each, with about 12 inches of blasting fuse (a light fuse will answer) pushed into the package and all pushed into the burrow. Jam a sod in the mouth of the burrow and light the fuse. The light explosion will force the sulphur fumes through the burrow. I never knew it to fail to kill unless the fuse was too short and the charge blew the sod out. E. S. MILLER.

Long Island.

Nov. 23. Wheat $1.05; oats 45; corn 60 to 70; potatoes from the field 25 to 30; onions 25 to 35; apples scarce. Owing to the quarantine there is nothing selling in hay and live stock except what hogs the butchers buy at eight cents dressed. Before the quarantine, cows sold at sales for $50 to $150. Butterfat now 34; eggs 30. W. E. H.

Bryan, O.

Here are some of the prices we pay for produce here: New-laid eggs, 60; butter 45; apples, any kind, $2.25 a box; turkeys 40 cents a pound; wheat $2.75 per 100 pounds; oats and corn the same; potatoes $2 per 100 pounds. A bunch of about 400 head of cattle sold for $51 a head straight through, a cow and calf bringing $102. The war hasn't affected the price of horses here yet to any extent. D. C. M.

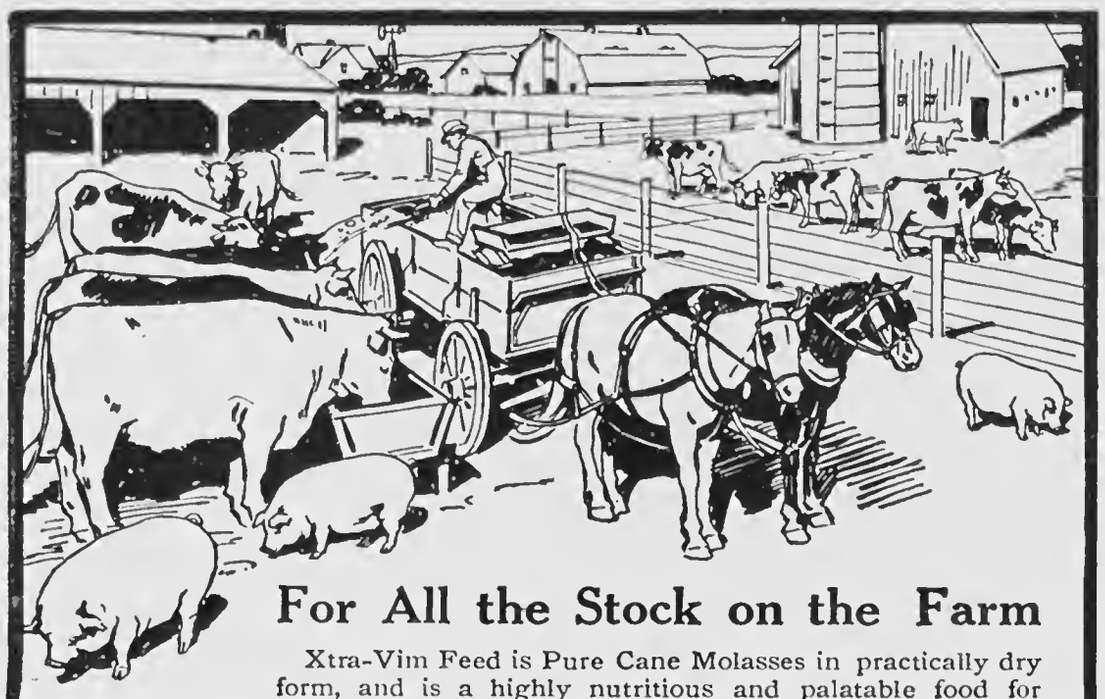
Tuscaua, Nev.

We have in this locality a cheese factory. It has given very poor satisfaction in general; the price of milk has run from $1.04 to $1.33 per cwt. It will average about $1.20 per cwt. Those prices are for 1914; here before it has paid well most of the time. Owing to the low price of milk there have been quite a number of cows for sale, but most of the farmers have disposed of their surplus stock at $40 to $50; springers and new milch cows are bringing $60 to $75. There is plenty of fodder. Hay and corn were a good crop. Silos have been well filled, but there is no grain crop this year, owing to the difficulty in harvesting and gathering the crop. After December 1 there will be some cows for sale, possibly a buyer could pick up a carload, and from indications the cows due to freshen in the Spring will bring about $50 according to age and condition. W. H. H.

Prattsburg, N. Y.

Nov. 23. Live stock, cattle, live, from 3 to 6 per pound; hogs 6 per pound; hogs, dressed, 7½; lambs, dressed, 12; sheep 8; poultry, hens, live, 10 a pound; Springs 12; ducks 11½; geese 12; turkeys, live 16 for fancy. Eggs, all colors, fresh, 30; dairy butter 30; creamery 36. Apples, No. 1, Baldwin, Spy, Kings, Greening and others $2 per barrel. No No. 2 wanted. Canning factories paid 50 cents per 100 pounds for hand picked No. 2 apples. Pears 50 and 75 per bushel. Crab apples 50 to $1.50 per bushel. Plums from 50 to 75 per bushel; grapes from 8 to 12 per fifth basket. Peaches plentiful and good, from 40 cents to $1 per bushel. Beets 60; carrots 50; cabbage 5 per head. turnips 35 and 40; onions 75; beets for stock use 30; carrots for stock 15. Farm crops: wheat $1.05; oats 45; corn 85; corn, new, 75. Beans, white, $1.30; kidney $2.25; hay, No. 1 Timothy, loose, $14; baled $16; mixed hay, loose $10 to $12 per ton; baled $12 to $14. Alfalfa not selling, farmers feeding same, what little there is. Straw baled $6.50 per ton; loose $4.50. Potatoes 30. Good cows sell here from $45 to $80 according to breeds. Horses from $80 to $200 per head; some sold for $500, matched teams. H. N.

Bangor, Mich.



For All the Stock on the Farm

Xtra-Vim Feed is Pure Cane Molasses in practically dry form, and is a highly nutritious and palatable food for horses, milch cows, fat cattle, hogs and poultry.

Xtra-Vim is a 100% value feed, not a condition powder. It is high in energy production and takes the place of an equal amount of less palatable feeds or grains selling at war prices. It is not a laxative, but it aids digestion, tones up the stomach and eradicates worms. Used as part of daily ration, it will improve the appearance, health and general condition of all the stock.

XTRA-VIM FEED

in 100-lb. bags is not sticky. It is as easily fed as bran, and has no more waste. It is a very economical feed and gives results which cannot be duplicated by any other means at anywhere near so low a cost.

Write for Feeding Booklet and Prices

You should try out Xtra-Vim Feed by giving it as part of the daily ration to some of your stock. If your feed store does not carry Xtra-Vim Feed, get our prices direct to you. It probably costs less than you think. Send today.

XTRAVIM MOLASSES FEED CO., 30 Broad Street, Boston, Mass.

LOWER YOUR FEED COST
with
OWL BRAND Cottonseed Meal
Full 41% protein guaranteed

Cottonseed meal is cheaper now than for years. Take advantage of the situation, and stock up. Animals need protein, feed a balanced ration. Good for Beef cattle, dairy cows, sheep, horses, mules, and even hogs when fed according to directions. Our booklet SCIENCE OF FEEDING free on request.

Canadian Wheat to Feed the World

160 ACRE FARMS IN WESTERN CANADA FREE

The war's fearful devastation of European crops has caused an unusual demand for grain from the American Continent. The people of the world must be fed and there is an unusual demand for Canadian wheat. Canada's invitation to every industrious American is therefore especially attractive. She wants farmers to make money and happy, prosperous homes for themselves while helping her to raise immense wheat crops.

You can get a Homestead of 160 acres FREE and

Other lands can be bought at remarkably low prices. Think of the money you can make with wheat at its present high prices, where for some time it is liable to continue. During many years Canadian wheat fields have averaged 20 bushels to the acre—many yields as high as 45 bushels to the acre. Wonderful crops also of **Oats, Barley and Flax.**

Mixed farming is fully as profitable an industry as grain raising. The excellent grasses full of nutrition are the only food required either for beef or dairy purposes. Good schools, markets convenient, climate excellent.

Military service is not compulsory in Canada, but there is an extra demand for farm labor to replace the many young men who have volunteered for the war. The Government this year is urging farmers to put extra acreage into grain. Write for literature and particulars as to reduced railway rates to Superintendent Immigration, Ottawa, Canada, or

J. S. CRAWFORD

Canadian Government Agent.

Running Qualities of Bulls.

"SCRUB bulls are good runners—they run the herd down." Found in the "Brevities" on page 1154.

That this statement is true can hardly be questioned. Time and again practical stock men have found that heifers sired by scrub bulls were noticeably inferior as to the quantity and quality of their product in comparison with like attributes of their dams. I have heard farmers contend that there were some scrub bulls that were worth more than many purebred animals, and while this is true in a few cases, it is not true in so large a number of cases as one may think. It is easy enough for one to think that he has a fine animal in his barn, then go to a fair and think his animal is better than any of those which are exhibited, but when it comes to a real comparison of the two animals, often there is none whatever.

The chief asset of the purebred bull is his ancestry. One must remember when buying bulls that a pedigree is nothing but family history—called genealogy when applied to the science of tracing human pedigrees. As a general thing, a superior scrub bull is a "happenstance," and only is found once in a while. In other words, his ancestry have not been selected at all, much less with any particular characteristic in mind. It often happens that in any particular family, there is often a very superior individual despite the fact that the common run of the family are decidedly below par. Common observation reveals to us that the offspring of this superior individual do not, as a rule, emulate the life of their parent, but rather tend to follow the general average of the family from which he sprang.

The purebred animals are the product of centuries of selection and culling, and is it then any wonder that they are able to transmit more of the desirable characteristics to their get than even a superior though scrub bull? Many of the strains in the various breeds have been selected and bred with a definite aim in mind for, some of them over a hundred years, and hence the heritage of one of these is much greater than that of the animal whose parentage has not been selected.

While it is often the case that a purebred bull is an inferior animal, yet it is the blood back of him that counts. We can say that the scrub bull has no blood back of him. For many decades the dairy breeds generally have been selected for milk capacity, and this has developed the tri-wedge conformation. It is true that a purebred bull of this conformation will put it on more of his calves and more distinctly than will a scrub that only happened to have this form.

Right at this point is where the records of production of ancestors become important. Two bulls may have family history traced back for the same number of years or generations but at that, the records of production are what do the testing. One animal has an ancestry of mediocre producers while the other's ancestry are nearly all high-quality animals. Unquestionably, the latter animal is far the more valuable. If a bull is worth keeping at all, he should be a good one. Of two bulls the same age and size, it costs practically the same amount to care for the poor one as for the good one and so about the only difference between a poor animal and a good one is the first cost. As to the difference in quality which two purebred bulls may actually impart to their offspring, we have the following quotation from Ohio Experiment Station Circular, No. 135, page 81:

One Holstein-Friesian bull used in the Ohio Experiment Station herd increased the average production of his seven daughters 1,299 pounds of milk and 40 pounds of butterfat per year above that of their dams. Forty pounds of fat per year for six years (average producing period) by each of seven cows would be 1,680 pounds of fat; 1,680 pounds at 30 cents per pound, equals $504. This animal cost $100 when a calf.

One Jersey used in the Station herd decreased the average production of his 11 daughters over 700 pounds of milk and over 45 pounds of butterfat per year below that of their dams. Forty-five pounds of fat per year for six years by each of 11 cows would be 2,970 pounds, which at 30 cents per pound would equal $891. The immediate difference in money value of these two bulls on these herds of less than 20 cows each was $1,395.00. Both bulls had an equally good chance to increase the production.

So it appears that there are such things as purebred scrubs. The bull should be tried out first and after he has proven his worth, then care for him in such a way that his hereditary characteristics are not impaired. The practice which some breeders follow of turning off their bulls from low-producing cows and selling them as breeders is lamentable. It is this very thing which is retarding progress in the dairy industry.

I. J. MATHEWS.

The Inheritance of Color in Horses.

BULLETIN 180 from the Kentucky Agricultural Experiment Station will be interesting alike to the practical horse breeder who desires to understand the scientific basis for the transmission of color and to the student of breeding who is interested in any investigations which may throw light upon its problems. The studies here described were undertaken with the idea of ascertaining whether or not color in horses is a "unit character" and so obedient to the Mendelian law of dominants and recessives among unit characters. It was believed that if color could be shown to be a true unit character the way might be opened to an understanding of the transmission of other more important characteristics. As a result of these studies, the author states that color has been shown to obey Mendel's laws and that through their application desired colors may be produced at will. The steps by which these conclusions were reached involve a technical understanding of the laws of Mendelism not usually possessed by the casual reader and not likely to interest him, but the conclusions, themselves, will attract the attention of all careful horse breeders.

The physical basis of heredity rests in small bodies, called chromosomes, within the germ cells of every animal, and every quality whether good or bad, appears to have its own chromosome. It is through the chance union of these chromosomes, or determiners, when the sexes are united that the quality which shall appear in the offspring is determined. Color is found to be a unit character, dependent, like other unit characters, upon the chance union of its chromosomes. It behaves like other Mendelian units, that is, it does not blend and lose its identity but, when recessive, disappears altogether though still retaining its determiners in the germ cells and, thus, its ability to reappear in some future generation. If the laws which govern the transmission of good and bad characters in the horse can be worked out as the author believes that those governing the transmission of color have been worked out, the breeding of horses can be put upon a more scientific basis and this preliminary study of transmission of color will have proved a valuable contribution to that end.

M. B. D.

Truth About Belgian Hares.

ON page 1338, E. R. S. asks about raising Belgian hares for meat once in a while. There is money in Belgian hares if handled right, and I do not think there is any danger of swamping the market, as they are always in demand. I have raised both Belgian hares and rabbits, but know the hares are more profitable than the smaller breeds. I have found them more profitable than poultry, easier to take care of, do not demand all high priced grain, will eat anything a sheep will. I would rather have a hare to eat any time than a chicken. Belgian hares can be raised for a family with very little cost, as they can be fed on potato parings, cabbage leaves and such things that are thrown away, with most families in town. They do not require expensive coops; a dry-goods box will do. They do not require an outside run. A box three feet square will do for a doe and her young until weaning time, although a larger pen is advisable when possible. A trio (two does and a buck) will supply a good-sized family with about all the meat they want, if cared for right. They can be bred six times a year, but it is not advisable to breed over four times. They will produce on an average about eight to a litter.

Waterloo, N. Y.

Advantages of Thick Cream.

"TIGHTEN up the separator screw." That is the advice a creamery sends out to its patrons, and for part of one year, one man was out a large part of his time tightening the separator cream screw. The following are the advantages: Cream keeps better when thick; does not sour as rapidly as when thin; there is a smaller quantity of cream to handle and cool; it can be cured for the factory more economically; more skim-milk remains at home; the capacity of creamery is increased without increasing its equipment, and when it is necessary to pasteurize cream much less is lost in the process when cream is thick. Further, the farmer saves in transportation charges. With such cream it is possible to produce better quality butter, with a possibility of better price per pound to the farmer for butterfat.

11 Year Old Boy Milks 55 Cows in 90 Minutes

Hugh Adair, Delhi, N. Y., writes:

"The Empire Mechanical Milker is a wonderful labor-saver. With two units, my 11 year old boy milked 55 cows *alone* all through haying. He was never more than an hour and thirty minutes. Have had no trouble with our cows' teats or udders since we have used the Empire. And my cows are giving more milk than if milked by hand." The

Empire Mechanical Milker

uses *natural* methods. Manipulates teats with *natural* air pressure. Doesn't use compressed air. Therefore, requires but *one* tank and *one* pipe line. Works the teats more *gently*—keeps even nervous cows contented. Works teats more uniformly—increases cows' milk yield. Capacity of double or two cow unit is 20 or 30 cows per hour. One man operates 1 or 2 double units. Write for complete information. Learn just how using an Empire assures quicker, better milking—purer milk—milk *free* from stable odors and impurities. Also get our offer on Empire Cream Separator, Empire Sta-Rite Engines and Empire Star Feed Mills.

There's a Big Difference in Silage

The succulence and palatability of perfect ensilage produces maximum results at a low feeding cost. No other feed contains as much "succulence value" as well preserved ensilage. It is the most economical feed for summer as well as for fall and winter. But there's as big a difference in silage as there is in silos. Build your silo of material that lasts for generations and keeps ensilage as fresh and succulent — all the year — as the day the corn was cut. Erect a

Natco Imperishable Silo

The silo that's made of vitrified hollow clay tile, whose glazed surfaces do not absorb the silage juices, and admit no air from without. No freezing. Reinforced by continuous steel bands. No swelling, shrinking, warping or cracking. No repairs, no painting no adjusting. Stops silo troubles forever. Write to nearest branch office for list of owners in your State, and for catalog "L."

"The Silo That Lasts For Generations"

The National Government and many State Governments have chosen HARDER SILOS

FOR 16 years the most famous "Quality Silos." Big sensational improvements this year make the Harder Silo better than ever. Of massive strength, anchored solid as an oak, perfect fitting doors, safe ladder, rigidly doweled staves, highest grade material and construction—perfect in every detail. More durable and profitable, less expensive than concrete and tile.

The Henyard.

Selling Cockerels as Roasters.

HAVING often read the statement that it was more profitable to keep cockerels until they reach roaster size, than it was to sell them as broilers, I determined this season to learn the facts for myself. Twenty-five White Rock cockerels, hatched April 25, were selected July 13, and then weighed 40 pounds, 11 ounces (an average of one pound, 10 ounces) and at 15 cents per pound live weight were worth $6.08. I would say here that in order to make an even 25 it was necessary to put in three birds that were somewhat smaller than the rest, thus reducing the average. These birds were put into a yard about 40x20 feet in an orchard, and a dry mash (one of the commercial growing feeds) kept before them, in addition to which they were given a mixture of cracked corn, wheat and oats morning and night. Green feed was given every day and a supply of fresh water was always within reach. The picture shown at Fig. 632 was taken the latter part of August.

All of the feed was carefully weighed and up to September 15 they had consumed 105 pounds dry mash, costing $2.36; 61 pounds cracked corn 95 cents; 77½ pounds wheat, $1.37, and 30 pounds oats 30 cents, a total of $4.98.

I then commenced to fatten them by taking away the dry mash and feeding them all they would eat, three times a day of the following fattening mash, mixed rather wet: 60 pounds cornmeal, 20 pounds middlings, 10 pounds linseed meal and 20 pounds beef scraps. This formula was recommended by the Maine Experiment Station, and I have used it for the past five years with very satisfactory results. During the last week, after they had eaten all the mash they were given all the cracked corn they would eat. During the following period they consumed 112 pounds of the fattening mash, costing $2.55, and 11 pounds cracked corn, costing 20 cents; total $2.75.

I sold them September 30; when they weighed 130 pounds (an average of 5 1-5 pounds) and at 15 cents per pound live weight brought me $19.50. The following summary shows the result of the experiment:

COST OF FEED.

105 lbs. dry mash	$2.36
61 lbs. cracked corn	.95
77½ lbs. wheat	1.37
30 lbs. oats	.30
112 lbs. fattening mash	2.55
11 lbs. cracked corn	.20
	$7.73
130 lbs. roasters at 15c per lb.	$19.50
Less cost of feed	7.73
Less value as broilers	$6.08
Gain	$5.69

This is a gain of nearly 23 cents per bird, which seems to me quite worth the extra labor. I think even better results could be obtained where it was possible to give the birds free range until time to fatten. WALTER A. ROBERTS.
Maine.

Standard Poultry Rations.

THERE are so many calls for feeding rations for hens that it seems wise to repeat what we have often given before. We shall keep this standing, or print it every two weeks through the season.

CORNELL RATION FOR LAYERS.

The following whole grain mixture is fed to the flock at Cornell University:

By Weight. Winter.		By Measure. Winter.	
60 lbs.	wheat	32 qts.	wheat
60 "	corn	36 "	corn
30 "	oats	30 "	oats
30 "	buckwheat	20 "	buckwheat

For a dry mash to be kept before the hens all the time this mixture is suggested:

By Weight.
Winter and Summer.

60 lbs.	corn meal
60 "	wheat middlings
30 "	wheat bran
10 "	Alfalfa meal
10 "	oil meal
50 "	beef scrap
1 "	salt

EGG CONTEST RATIONS.

At the egg contest at Storrs, Conn., the following grain mixture is fed:

Coarse wheat bran	200	pounds
Cornmeal	100	"
Gluten feed	100	"
Standard middlings	75	"
Fish scrap	30	"
Beef scrap	30	"
Low grade flour	25	"

There are little boxes holding grit, shells and charcoal which the hens take as they like. There is also provided a "scratch grain" made up as follows:

Cracked corn	60	pounds
Wheat	60	"
Heavy white oats	40	"
Barley	20	"
Kafir corn	10	"
Buckwheat	10	"
Coarse beef scrap	10	"

Better cut this out to be used for reference.

White Eggs; Selecting Pullets.

ON page 1914, Mr. George A. Cosgrove, remarks of Leghorns that: "In localities their white eggs command a small premium." Yesterday, in the New York market, the difference in price between the best brown and white eggs was 14 cents a dozen! This is a premium worth having. The best "hennery whites" were 57 cents and the "hennery browns" were 43. My recollection is that once or twice this season the difference has been as great as 17 cents a dozen. Guess I'll stick to hennery white!

By the way—I have a pen at Storrs this year. Three of the birds (Nos. 483, 486 and 487) are a cross between a full blood Tom Barron cockerel and hens of my own stock. No. 481 is a daughter of "Miracle Mary," my good old hen that THE R. N.-Y. mentioned last Winter. I'm afraid my pen won't be away up top because I am not sufficiently expert to select immature pullets that I believe will lay heavily later on. I had to be sure of my pullets; so I sent birds that I knew were laying. The 10 birds have probably laid 100 eggs already—so that will be their handicap. They laid seven eggs the day before they went to Storrs and only laid four eggs during the first eight days of the contest. I think they will strike their gait pretty soon—when they get used to the trap-nests and accustomed to their new environment. Whatever they do—good or bad—will be a lesson anyhow. GEO. BOWLES.
Connecticut.

A BUNCH OF COCKERELS FOR ROASTERS. FIG. 632.

R. N.-Y.—In Boston and some other cities the brown eggs command a premium nearly as large.

Ventilation for Henhouse.

COULD you assist me in solving my ventilation problem? I have a poultry house 12x15 feet, which is divided into two pens, with three-quarter partition. Three sides of the house are tarpapered, the front of house which faces the South has eight sashes 2x3 feet, arranged so the lower sash, which is one foot above cement floor, is glass, the upper are covered with burlap. The roost is seven feet back from window, and one foot below upper windows. My Leghorns all sneeze and have colds. Is it the fault of my ventilation? Have I too much glass or too much burlap for our Long Island climate? Would you make any change in arrangement of windows?
Long Island. B. K.

The only test for efficiency of ventilation in a poultry house is the condition of the air within it. This should be so dry at all times that moisture will not condense upon the walls and quickly render the litter damp and sticky. If you are keeping the sash in your house closed, the burlap very likely does not afford sufficient ventilation, and it would be better to keep the upper sash partly or entirely open at all times, save during a driving storm or, perhaps, upon an unusually severe Winter night. Dry air, even if very cold, is harmless to warmly clad fowls while warm, moist air is absolutely incompatible with health. I would advise placing the perches as far back from the front as possible and providing a drop curtain which can be lowered in front of them on extremely cold nights. The upper sash can then be left open at practically all times. While fowls should not be exposed to direct drafts particularly while upon their perches, the tendency is to give them too little, rather than too much, fresh air. When the ends and rear wall of a poultry house are made airtight, the front may be made very largely of wire poultry netting to the advantage of the occupants and owner. M. B. D.

Picking Ducks.

CAN someone give me any information as to the best way of picking ducks?

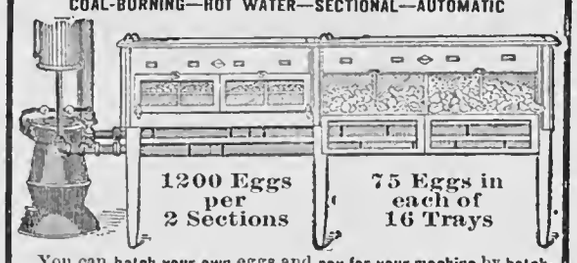
In dry picking, particularly in young ducks, it is difficult to clean-pick without tearing the flesh, and in getting off the very small fuzzy feathers, and I fear to scald them, as the hot water may give the carcass a greasy appearance.
New Jersey. A. H. K.

To dry-pick a duck suspend it by the legs and with a sharp knife cut across the back part of the roof of the mouth to sever the arteries. Then with a short club hit the top of the head sufficiently to stun the bird. Begin to pick immediately in order to get the feathers off before death contracts the muscles. Some pickers sit beside the box for the feathers and hold the neck between the right knee and the box to prevent scattering blood. A pail of water should always be near into which the hand can be occasionally dipped. The feathers stick to the wet hand and are removed much more easily. Hard rubbing with the wet hand will remove much of the down. Professional pickers have knives of good steel and razor sharpness with which to remove the pinfeathers and shave off the down that cannot be removed by hand. If possible visit a professional duck-picker. W. H. H.

ANOTHER HEN RECORD.—On page 1328, I find record from H. B. Smith, from 450 S. C. White Leghorns for one year. Below is my report for eight months for 35 S. C. White Leghorns two and three years old (about one-third three years). Total eggs 2,721, 227¾ dozen, average price, per dozen, 47 cents. Amount received from eggs $106.78; feed $41.51; eggs, per hen, 128; profit, per hen, $1.86. On August 11 of this year I sold the 35 hens and received $14.36, which is included in the amount received. No eggs were sold for hatching or used for this purpose. I feed the Storrs Agricultural Experiment Station formulas with all the cabbage they can eat the year round. My coops are open front with drop curtain. My hens are kept in beginning with the first cold spell until the middle of March. I am a commuter working in New York, and have about two hours each day with a half a day on Saturday to give to the poultry business. I keep no fancy show birds, but breed for the quantity only. I have all May-hatched pullets, numbering 40 which have started to lay. These pullets were handicapped in laying because nearly all had the chicken-pox, which I am glad to state was readily overcome. The reason I kept the three-year-old hens was for the simple reason that I have heard of others having hens considerable older which gave a profit to their owner. C. S. D.
Clifton, N. J.

The department of poultry husbandry at Cornell, is sending out members of the staff to give instructions to poultrymen in culling layers for Winter production and breeding stock. The trips are made in circuits, the arrangements being made in advance. The work is done without charge except for hotel and traveling expenses.

Hatch 2-Cent Eggs Into 15-Cent Baby Chicks
Work this business on a large scale for your own community and ship day-old chicks to other localities.
START WITH THIS 1200-EGG
Candee Incubator
COAL-BURNING—HOT WATER—SECTIONAL—AUTOMATIC



You can hatch your own eggs and pay for your machine by hatching eggs for others. The sale of day-old chicks brings big money.

A Steady Cash Income When Crops Are Quiet
This 1200-egg machine gives you four 300-egg compartments which can be started at different times and regulated separately by Automatic Thermostats. 16 different 75-egg trays, separated by wire, to keep eggs and chicks separate for different customers.

Double Regulation—Double Protection
An automatic regulator on the coal-burning heater and an Automatic Thermostat regulator in each compartment means double safety and insures steady, even heat that produces larger and stronger chicks. Costs a few cents a day for fuel. Takes a few minutes time. Anyone can operate it successfully. Comes all-built, ready to set up. As business grows, you simply add extra sections instead of changing incubators.
Be the one to start in your locality.
Write today for 140-page catalog describing in detail the success of hundreds of operators in all parts of the country. We supply cellar plans and details for operation of custom business.

THE EGG-LAYING CONTEST.

THE fourth week of the contest, ending Nov. 29, shows a gain of 132 eggs over last week, the total for the week being 1,171. Pen No. 60, Storrs Experimental pen of White Leghorns, laid the highest number, viz., 42; Edward Cam's White Wyandottes being second with 39. Hillview Poultry Farm's Rhode Island Reds laid 38. This distributes the honors for the week among three breeds. The White Leghorns from Windsweep Farm still have the largest total, 172, and their output this week of 35 eggs places them fourth for the week. Edward Cam's White Wyandottes are next in the total; they have laid 158; 12 pens have not laid an egg yet.

A few years ago the fanciers who won premiums at poultry shows were the only ones to obtain large prices for fowls, and naturally great stress was laid on perfection of markings on the feathers, on feathers on the middle toe of some breeds, on total absence of feathers on the legs of other breeds, on the shape of the comb, on the color of the ear-lobes, every one of these things being objects of earnest endeavor, yet none of them were of any real benefit. The egg laying contests have already made a great change in conditions. Now, a man who has bred his birds for egg production and demonstrated at the contests that he really has a strain of fowls that can and do outlay others, can get as much for his birds for breeders, or as much for eggs for hatching, as the fanciers only could get a few years ago, and the point of importance in all this is, that the whole country is benefited by it. The report for the week follows:

GEO. A. COSGROVE.

Poultry and Foot-and-mouth Disease.

IT seems that some of the poultry dealers have claimed that the increase in the price of poultry was due to foot-and-mouth disease. This claim is nonsense. The disease does not affect poultry at all and except upon farms where the disease is actually found the movement of poultry would not be interfered with. The Department of Agriculture makes this statement:

"It is true that when a case of foot-and-mouth disease is found upon a farm that farm is absolutely quarantined by the State or local authorities. No prodnce of any sort can leave it, the owner is not even permitted to drive his horses on the public highway, and in some cases his children are not allowed to go to school until the exposed stock have been done away with and the entire premises thoroughly disinfected. Since the disease, moreover, is readily communicated from farm to farm by cats, dogs, poultry, and human beings, the local authorities exercise their own discretion in determining what restrictions should be placed upon shipments of produce from the area in the immediate vicinity of the infected farm. These areas are so limited in extent, however, that the amount of poultry that may thus be prevented from reaching the market is an inappreciable percentage of the total supply."

Hens With Colds.

WE have a few young pullets of this year, with a new-built coop. Two of them are suffering from a heavy nose-running, both eyes swollen up. What disease is this and what remedy would you suggest? I have been using olive oil for the eyes and that seemed to open them up and also kerosene oil for the nose. They seem to be a little better. Can you suggest any other treatment? MRS. M. F. T.

New Jersey.

These pullets have evidently acquired "colds," or catarrhal inflammation of the nostrils and eyes and it is possible that true roup may be present. A disagreeable, markedly foetid, smell about the discharge from the nostrils and eyes would indicate the presence of the latter disease. In any event, they should be removed from the rest of the flock and kept in a dry, comfortable, place where they may be fed upon soft food and given only water to drink that has had a teaspoonful of permanganate of potash crystals added to each quart. Their heads may be frequently dipped into the same solution. It would be well to add the permanganate crystals to the drinking water of the healthy fowls also, and if there is any suspicion of roup, to clean up and whitewash their quarters and disinfect their utensils with boiling water. Any fowls afflicted with roup should be killed and their carcasses deeply buried. The symptoms of roup in its early stages and those of a hard cold are very similar but the evidently greater severity of the disease and the more offensive odor should distinguish true roup from even a hard cold. M. B. D.

"MISTER," said the professional beggar, "I've got two cents an' I need three more fer a cup o' coffee." "Sorry, I have nothing smaller than a $5 bill." "That's all right; I'll change it for yuh." —Philadelphia Evening Ledger.

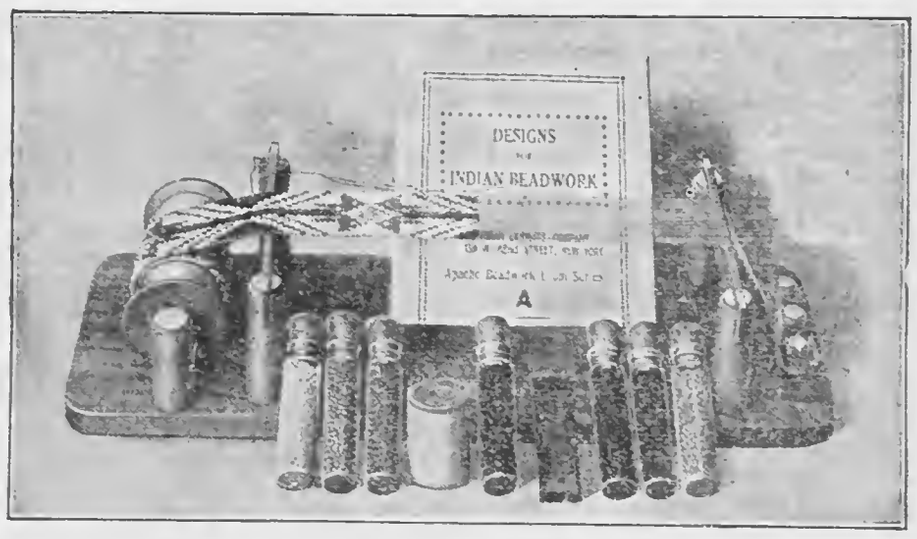
Indian Bead Work



NOTHING is more fascinating or more in vogue at this time than **Indian Bead Work articles.** We have procured an outfit for making these articles, which will be sent, delivery charges prepaid, for

ONE NEW YEARLY SUBSCRIPTION
OR
THREE YEARLY RENEWAL SUBSCRIPTIONS
(One of these may be the renewal of your own subscription for one year.)

This outfit consists of a Patented Loom for making articles, an instruction and design book, a spool of cotton, twelve H. Milward Sons' needles, seven bottles of colored beads—dark blue, green, light blue, black, red, yellow and white—a complete outfit to start the work.

Every woman knows and appreciates the value of these home-made articles.

Your neighbor needs *The Rural New-Yorker.* If he is not a reader get his subscription. If he is a subscriber get his renewal.

These articles will not be given with subscriptions—they are sent as rewards only (in place of cash) to our subscribers and friends who, acting as agents, send us subscriptions as indicated.

THE RURAL NEW-YORKER, 333 W. 30th St., NEW YORK CITY

PUBLISHER'S DESK

I AM asking my advertising agent to direct the publisher not to insert our advertisement again in any publication containing the advertisement of the Arnold Watch Company.

New York City. WM. H. INGERSOLL.

This refers to the Ingersoll dollar watch advertising. It is the kind of work that tells. If two dozen large national advertisers like Mr. Ingersoll would persistently follow his example fake advertising would disappear from large publications in three months. The publisher has the destiny of fake advertisers in his hands, and large responsible advertisers should use their influence to urge the publisher to his plain duty.

If your station happens to be what is called a *Non-Agency Station*, when ordering goods by freight or express request the shipper to notify you when shipment is made, so that you can be on the lookout for the goods, as the transportation companies assume no responsibility after goods are placed at the station, if there is a station, or beside the track if there is no receiving station. They claim their liability ceases when the goods leave their hands. We have had considerable trouble with complaints growing out of such circumstances, and a little precaution will protect the receiver of goods at such places.

I have your letter with voucher for $10 from the Long Island Railroad Company in payment for damages to goods shipped over their system. The speedy settlement surprised me, as the company, after a "thorough investigation," decided that $3 would pay for all damages. When this was refused they raised it to $5, and I refused that offer, as my claim was just and exactly what it would cost to repair damages. I turned it over to you and settled down for a long wait. Your letter comes as a surprise with this voucher for the full amount. I thank you for your efforts and the satisfactory ending of the case. T. P.

New York.

When we get all the evidence, and the claim is just, we can now get settlements in reasonable time. It hardly takes days where we used to take months.

I shipped eggs on April 28, May 4 and July 28, and the express company failed to deliver two cases. I have asked them to tell me who received them, but they have not done so. Will you take it up with Adams Express Company and see if you can get them to settle? W. W. C.

New York.

The above came to us in August. In November we received the following:

It is with great pleasure I am now able to inform you that through your persistent efforts, payment in full has been received for the two lost shipments of eggs. I feel sure it was your interest that secured the adjustment of this claim.

New York. W. W. C.

On July 8 I bought a pair of horses from William McGeary at the Atlas Stables at 154 East 27th Street, New York City. Mr. McGeary gave me a guarantee on the stationery of the Consolidated Ice Company, specifying that the horses were good workers in single and double harness, and if not as represented could be returned within a month and the money would be returned in full. In driving the horses home both of them broke down and showed evidence of having been doped a short distance from the city, and they were returned to Mr. McGeary at the stables from which they were bought. Mr. McGeary claims that he did not have the ready money and gave me a note for the purchase price. The note is past due and a lawyer in whose hands I placed it for collection has returned it as worthless. N. M.

New York.

The above experience is a typical experience of farmers who come to New York to buy horses and fall in the hands of the horse "gyps." The rule is, these "gyps" purchase the cheapest broken-down horses they can find, dope them up and feed them up until they make a good appearance, and then sell them at what appears to be a bargain price. These "gyps," who are typified by Wm. McGeary, will guarantee money back if not satisfactory, or make any other conditions necessary to make the sale. As their guarantee is worth nothing, they have nothing to lose in giving a written guarantee. Our information is that Mr. McGeary lives at 298 Stuyvesant Ave., Brooklyn, N. Y., in good style; supports an automobile, and lives in apparent ease and luxury. These horse jockeys are always shrewd enough to avoid criminal responsibility in one way or another. Mr. McGeary seems to have done so in this case by offering the note in settlement, and the same having been accepted by the purchaser of the horses, otherwise he would have been subject to prosecution by the District Attorney on the charge of fraud. The experience is valuable only as a warning.

What do you know about the Cavies Distributing Company, Kansas City, Mo.? They say they are members of the National Pet Stock Association, and sell breeding stock of guinea pigs with a guarantee to sell all I raise for me at not less than one dollar a pair. J. W. B.

New Jersey.

We have never known a responsible firm to guarantee to buy the entire products of breeding stock either animal or vegetable; but we have known many irresponsible and fake concerns that made such promises to sell the stock they wished to dispose of. One must bear in mind that a guarantee is good for nothing unless the concern making it is responsible for his contracts, and even then it often happens that it would cost more to enforce the contract than it is worth. Our advice is to forego all of these sure thing profits, where you are obliged to make the first remittance. If there is such a sure thing in the breeding of guinea pigs, why not let the company furnish the breeding stock, and you do the breeding? They could then take back the first products to pay for the stock and buy the balance. We venture to say you could give as good assurances of responsibility as the company can furnish.

I am enclosing you a card of D. B. Cornell Company, Great Barrington, Mass. Please let me know if this company is reliable. They charge a fee of $20 for listing. This leaves me the privilege of selling the farm by giving them 10 days' notice. I would like your opinion of this.

New York. SUBSCRIBER.

Farmers who take our advice will sign no blank contract whatever with real estate agents. If you want them to handle your property write them a letter saying what you want to do, and keep an exact copy of it. We would also advise never to pay an advance fee under any circumstances. It is time enough to pay a fee when the property has been sold and a contract signed with a responsible buyer who makes his first payment to you direct. Agents of the above concern have given receipts to return the fee if the sale was not made within one year; but the owner could not get the money back when the year expired. We have one such claim now.

I enclose a letter from Mr. Savage or his minions. Do you suppose I shall be compelled to pay this demand? Savage failed utterly to keep his part of the agreement, and pays no attention to my letters of explanation. I fed his food according to directions and not only received no benefit but lost my hogs besides. C. O. G.

Iowa.

The letter inclosed reads as follows:

We are just about to prepare our next publication listing for sale all accounts, notes and claims in our hands against delinquent debtors. This list is to be published in the local papers in the community wherein the debtor resides, in addition to being posted in the public places designated for the posting of legal sale notices.

A copy of the list will also be sent to the merchants and business concerns in your town and all surrounding towns besides those all over the country using our service.

The account you owe the International Stock Food Company is listed among other claims, and will have to be published along with the rest. We warned you of this proceeding in a former letter to give you a chance to protect yourself. We are sure you do not want your neighbors and friends to see your name among a list of delinquent debtors, and we are writing to give you an opportunity to pay this claim before this publication is issued and save yourself this notoriety.

We will wait ten days and we urge that you respond promptly and avoid the seriousness of this situation.

Yours very truly,

NORTHWESTERN COLLECTION & ADJUSTMENT CO.

Accompanying this letter was a list of alleged bad debts with the announcement that they would be offered for sale at public auction. We refrain from expressing our opinion of this literature. What our feelings might dictate would hardly look dignified in cold type. If Mr. Savage thinks to build up a trade with farmers on this kind of treatment then the future only can decide the wisdom of his policy.

J. J. D.

BOOK AGENT: Uncle, I'd like to sell you a new cyclopedia. Uncle Swayback: Wa-all, young feller, I'd like ter hev one, but I'm afraid I'm too old to ride the thing.—Melbourne Leader.

THANKSGIVING PRICES IN BOSTON MARKET.

BOSTON market was well supplied with fruit and vegetables, the demand this year not being much above the average demand each week along this line. Oranges, however, were short, contrary to expectation, as a good supply from Florida was expected to be on the market on or before this time. This year, however, these seem to ripen up slowly and most shipments received from there so far have been green. It is also between seasons for California stock to be in large supply, what there is of those bring about $5 per box. Floridas sold at $2.25, $3, $4 and $4.50 per box. Lemons are plenty and cheap for the season; California stock brought $4 per box, foreign stock $2.50 to $3.50. Grape fruit very plenty and cheap at $2 to $2.75 per box. Bananas also very reasonable at $3 for best yellows, others $2.50, $2.25, $1.50 and $1.25 per bunch. Reds $1.50 to $4.25. Cranberries still in large supply, and only fair demand keeps the price at the former low level, $3.50 to $4.50 per barrel and $1.50 to $1.75 per box. Pears fair both in supply and demand; Bosc $2.50 to $3.50 per box; Anjou $1.50 to $1.75; other kinds $2.50 to $3; Native and foreign nuts in good demand at reasonable prices. Naples 14 to 18 per pound; others from 11 to 15, except almonds, which bring around 20. Dates 7 and 8 cents per pound; figs 15.

Apple trade better, as demand is good and supply on hand of best fruit is not heavy and brings good prices. Most of the poor stock is now disposed of and common stock on hand is not much above the demand of same, both these classes are helped by good prices in English markets which are about $2 per barrel above this market and only about $1 per barrel is cost of transportation to same. Up to Nov. 21st the report says 1,028,412 barrels have been shipped against 956,095 for last year. In this market McIntosh sell at $3 to $4 per barrel; Snow, Wolf River and others $2 to $3; Baldwins $2 to $2.50; Greenings about $2; Native box fruit 50 for cooking stock up to $1.50 for fancy sorts; Western box fruit average about $2.

Potatoes not in heavy demand and with a fairly good stock on hand prices are dropping slightly; $1.10 per bag being yard price at this time. Sweets in good demand for certain trade and price is $3 and better per barrel, or $1.35 per basket. Onions doing much better for two reasons, some export trade is developing, and the common stock is now used up, making it necessary to sell from the storage stock for which holders and dealers expect some profit above cost. Connecticut Valley up to $1.50 per 100-lb. bag. Spanish $3.50 per crate; Native box stock, 75 to $1; cabbage, Savoy and drumhead, bring nearly or quite $1 per barrel; red stock 90 per box; cauliflower from California $1.50 per crate. Cucumbers $5.50, $3.50 and $2.50 per box. Celery prices did not change much, 75 and $1 per dozen is the price for white stock with Pascal and Boston Market $1.25 to $1.75. Lettuce 75 per box. Squash, Boston Marrow, 90 and $1 per barrel; turban and Hubbard $1 and $1.25 per hundred pounds. Hothouse tomatoes 20c per pound; Florida stock $2.50 per crate. Turnips 75 and $1 per box for white egg and purple top, rutabaga going at $1.25 per bag. Beets 75 and better per box; carrots 75 to 90; parsnips $1.25; radish 30 per dozen bunches; spinach 65 per box.

Very best butter is not plenty, yet the supply is expected to increase in a few weeks, and as other grades are in rather large supply the price is in buyer's favor, on the latter at from 29 to 32. The former brings 34½ for Western stock while nearby Northern stock brings 35 to 36½. Supply of cheese plenty for demand, with prices from 15½ to 17 on the various grades. Eggs are believed to have reached the top figure for the year, and sales of strictly fresh are rather larger than sales of storage stock at this time. Usually it works the other way and storage stock has a heavy sale at this season; price for latter is 27 to 36, with good grades working off at 40 to 50; best nearby fresh stock 55 to 59.

Turkeys were up in price equal to or better than last year's prices, especially at retail; about 35 per pound was a general price for not very fancy looking birds. Wholesale prices were 24, 25, 26 and 28. Sales of chickens were heavy this year because of turkey prices; these were sold at from 22 down to 15; ducks 18; geese 20. Best dressed beef 14½ per lb.; good 12; others 10 to 11; best lamb 15; good 12½ and 14; veal 16 and 17. Dressed hogs around 10.

Trade in horses is a little dull on all grades, especially on second and third quality horses, with which the market is flooded, and prices rule low in this class, $50 to $100 each are about the figure on them. Good second-hand stock is snapped up at good prices of $250 or thereabouts. The few green ones sold are not much or any above cost figures, and those who can will hold until later, or Spring when prices are expected to jump.

Hay prices hold at about the same level, $23 per ton for best; other grades $22, $20, $18 down to $15. Meal $1.57 per 100-lb. bag; oats 54 to 57 per bushel; cottonseed meal $30 per ton; gluten $33.50; linseed $35; bran $27.50 per ton; Alfalfa meal $24. A. E. P.

NISCO
"The TROUBLE-PROOF SPREADER"
is the choice of the business farmer who values spreader perfection. It positively will do more and better work in less time than any other machine. It took us 15 years to perfect this mechanical masterpiece which we know to be
100% EFFICIENT
Thoroughly pulverizes the manure, spreads it wider and more evenly than any other spreader. Easy to load, since sides are only 41 inches above ground. Bed is from 3 to 5 inches deeper than any other so-called "low down" spreader. Built for thorough work and lasting service.
FREE Circular in Colors and Descriptive Catalog
Gives reasons why "Nisco" and "New Idea" are the "Best Spreaders on Wheels." Shows why our machines are practically trouble-proof. Settle the spreader question for all times by writing us Today.

Products, Prices and Trade.

Wholesale Prices at New York,

Week Ending Dec. 4, 1914.

MILK.

The Borden milk schedule to producers for the six months beginning with October is as follows. This is per 100 pounds in the 26-cent zone. This is what is known as the "maximum" for milk testing 3.8 to 4.2 per cent. fat, and is 20 cents per 100 pounds above the "flat" rate.

	1914.
October	$2.00
November	2.10
December	2.10
January	2.05
February	1.95
March	1.90

Wholesale prices paid by New York dealers are running $2.01 and $1.91 for B and C. Hotel and restaurants using two to three cans per day are paying five to six cents per quart, single quart prices from bakeries and grocery stores, six to seven cents; delivered milk, nine to 10 cents.

BUTTER.

Prices are running about one cent below last week's figures. On lower grades the decline has been still more.

Creamery, extra, above 92 score, lb	33½	@	34
Extra, 92 score	32½	@	33
Good to Choice	28	@	32
Lower Grades	23	@	25
Storage	26	@	32
State Dairy, best	31	@	32
Common to Good	23	@	28
Ladles	20	@	22
Packing Stock	19	@	21
Process	22	@	26

Elgin, Ill., butter market 32 cents.
Philadelphia, western creamery, 34 cents.
Boston, western creamery, 33.
Chicago creamery, 24@32.

CHEESE.

The market is rather weak, although prices on top grades are held firmly. Stocks in local storages are more than 50,000 boxes in excess of last year.

Whole Milk, fresh, specials	16	@	16¼
Average fancy	15½	@	15¾
Under grades	12	@	14
Daisies, Wisconsin	14¾	@	15¼
Skims, specials	13	@	13½
Good to choice	11	@	12
Poor to fair	7	@	10

EGGS

Nearby white eggs continue scarce, occasional sales above 60 cents being noted. In medium and under grades the market is extremely weak. Fresh gathered stock sells from 25 to 40 cents, and storage mainly 25 to 27 cents.

White, choice to fancy, large	58	@	62

VEGETABLES.

Potato prices remain as for several weeks, mainly 50 to 60 cents per bushel wholesale. The quarantine on imports of Canadian potatoes to this country, established a year ago, because of disease, has been removed. For the present the Canadian stock will be admitted at only two points, New York and Boston, where Federal inspectors will examine all receipts.

GRAIN.

No special change in grain prices, except rye, which is unusually high. This of course applies only to rye free from onion. Nature has given the wild onion a strong grip on the rye crop, as the little sets on the top dry down to the size, appearance and nearly the weight of rye kernels. They readily go through any ordinary rye screen in the fanning mill, and very few are enough to spoil a batch of rye flour. Hence buyers are always on the lookout for onion in rye. The only way to get rid of this pest is to dig it out of the growing crop and burn it—not a serious job where there are only scattering bunches in the field.

For the 11 months ending with November, incorporations of $1,000,000, or upwards, each, totaled $789,497,500.

*

We have now 7,584 National banks, with capital of $1,074,074,675, and outstanding circulation of $1,111,999,076.

*

Savings banks were first opened in this country 98 years ago. There are now 10,766,936 depositors with a total of $4,727,403,950.

*

Wheat and flour exports from United States and Canada since July 1 amounted to 160,000,000 bushels; oats, 32,000,000, the latter being 26,000,000 more than for the same time last year.

*

A New York concern recently sent a load of furniture by motor truck to Albany, the total expense being $18 less than by rail shipment, and the goods delivered without scratches or damage ordinarily received in transportation. The running time for the round trip of 348 miles was 30 hours.

*

About three-fourths of the commercial onions in this country are grown in 16 States. The crop this year is figured at 21,600 cars, about one-third being put in storage.

*

This year's grain yields of the prairie provinces of Canada are:

	ACREAGE	YIELD
Wheat	11,125,975	140,261,000
Oats	6,226,571	144,437,000
Barley	1,967,791	35,763,000
Flax	1,004,513	5,738,000

*

Reports from 10 of the largest cabbage-producing States show a crop of 20,000 carloads, one-fourth being stored for Winter sale. This year's yield is about 2,000 carloads above last.

It is a great cry at all farm produce is low, and to a great extent it is. Apples are from 60 to 75 cents per barrel. Potatoes about $1 per barrel; fine veals are bringing 10 cents per pound; pork about 12; butter 36 to 33; turkeys from 22 to 25 live weight. Milk is about $2. Good grade cows run from $70 to $90. Horses are rather quiet. E. F.
Cambridge, N. Y.

Nov. 30. This is not much of a cow section; everything here is tobacco. However, there are some cows kept, selling from $75 to $100. At a recent auction held about five miles from here, cows sold from $80 to $118. Milk for the Hartford market is bringing the farmers 4½ cents per quart for the Winter. Everyone seems to have plenty of feed, especially hay and corn fodder. The foot-and-mouth disease is causing a lot of trouble and worry, but I think our Commissioner of Domestic Animals is doing all he can to stamp it out. There seem to be one or two new cases that are giving the commissioner and his deputies some worry in not being able to trace the source of infection. However, most of the cases have been traced to one carload of cows shipped to Hartford from Brighton, Mass., then sold out among the farmers. W. B. W.
Warehouse Point, Conn.

One Worm-sick Hog

Will Infect Your Entire Herd

Mr. Sidney R. Feil, President of the S. R. Feil Co., is a Registered Pharmacist, a graduate of the Cleveland School of Pharmacy and the National Institute of Pharmacy. He has been engaged in laboratory work for more than 25 years. For many years engaged in compounding veterinary remedies.

Take No Chances

A single worm-sick hog is liable to infect your whole herd. You know that wormy hogs have little vitality and so are easier victims of cholera and swine plague. That scrawny, worm-sick hog — the one with the rough coat, white eyes and harsh cough, is a positive danger to all the rest in your herd. Take no chances. **Feed SAL-VET;**—be assured your hogs are free from these dangerous pests and much less liable to fatal diseases. Let me feed them 60 days on SAL-VET at my risk—let me prove the value of this wonderful worm destroyer and conditioner. Let me prove that you can't afford to be without it. If it fails to do what I claim, it won't cost you a a cent. Thousands have found it so profitable to feed SAL-VET that they feel they cannot afford to be without it. The hog that is wormy usually eats more than it can digest, is ravenous, ill-natured—discontented and unthrifty. It is a profit-eater instead of a profit-maker.

$125 Profit in Four Weeks.

"Four weeks ago, just before I received my SAL-VET, I offered to sell my hogs for $25.00, but could not do so. Since feeding SAL-VET, they have passed many worms, some of them ten inches long, and they made such gains, that I would not sell them now for $150.00"—Dan. MacAloney, Tenney, Minn.

SAL-VET Saved His Hogs.

"Hogs all around me are dying with cholera. We have lost none yet, and all are doing well since feeding SAL-VET."—Frank Bally, Alto Vista, Iowa.

Rid Them of Worms.

"I had a bunch of twenty-eight hogs that coughed continually, and refused to eat. After feeding them SAL-VET a while, the coughing ceased entirely, they recovered their appetites, and grew rapidly."—J. Brennecke, Jackson, Mo.

Gives SAL-VET the Credit.

"Am still feeding SAL-VET to my hogs and sheep all the time. Last week, I was in Chicago with a carload of hogs which had had constant access to SAL-VET—they came within a nickel of the top."—Donald E. E. Asay, Mgr. Burr Oak Farm, Mt. Carroll, Ill.

SAL-VET Saved Their Sheep.

"About the first of September, 1912, our lambs commenced to die, and we lost about 20 head. Finally we went to an old sheep man, and asked him what to do. He said, 'I guess your lambs have stomach worms and you better feed them SAL-VET'; so we ordered one hundred pounds and started feeding it in bran and oats, and in a few days we were convinced that our friend had advised us right, as we found piles of dead worms where the lambs had been at night. We saved 74 head of lambs and could have saved all of them had we only fed SAL-VET sooner. Our lambs gained flesh very fast after they got rid of the worms and we sold 24 bucks at an average of 78 pounds each. SAL-VET is a wonderful remedy as a worm destroyer and tonic and we take pleasure in recommending it to all stock raisers."—Cutler & Hayes, Salem, Ills.

TRADE MARK

SAL-VET

REG. U.S. PAT. OFF.

The Great Worm Destroyer — **Live Stock Conditioner**

Is not a food; it is the medicated salt which contains no antimony—which rids all stock of worms—aids digestion—allowing animals to get the utmost good of rations fed, instead of having the feed absorbed by a myriad of stomach and intestinal worms. I want you to try SAL-VET on your own stock—in your own barn-yard at my risk—I want to prove to you that your hogs will gain faster on no more feed—look better, act better, and be in healthier condition, less liable to disease and sell better. Here is my offer:

Don't Send Any Money—Just the Coupon

Tell me how many head of hogs and other stock you have; I'll ship you enough SAL-VET to last them 60 days. Simply pay the freight on arrival—feed the SAL-VET according to directions. At the end of 60 days report results. If SAL-VET has not done all I claim, I'll cancel the charge—you won't owe me one cent. Here is a chance for you to see with your own eyes, without risking a cent, what this wonderful preparation will do; see it stop your losses from worms; see it save you money — save you feed and make money faster by shortening your feeding period.

Get a Big New Overland For the Big New Year

Nineteen fifteen is just a stone's throw away.

The most conservative estimates promise the biggest, best and most prosperous year you have ever had the pleasure and privilege of living through.

So now, as never before, you need a car.

And what is more—*you need an Overland.*

Here's why.

The Overland offers the greatest intrinsic value for the very least amount of actual money.

Regardless of price—it is one of the handsomest cars ever built. The beautiful full stream-line body is one of the most admired designs of the season.

Regardless of price—it is one of the most comfortable cars ever built. The long underslung rear springs make it ride with absolute ease and smoothness at all times. So do the large tonneau, deep and soft upholstery, and large tires.

Regardless of price—it is one of the most convenient cars ever built. It is electrically started and electrically lighted. All of the electric controls are conveniently located on the steering column. You can operate every button without changing your driving position.

Regardless of price—it is one of the most complete cars. There are demountable rims, with one extra, a high-tension magneto, built-in ventilating type windshield, mohair top and boot, magnetic speedometer and curtain box. In fact every modern improvement.

Then remember this—

The first cost is not only considerably less but so is the operating cost. In both directions you save money.

Also remember that every Overland is backed by a world wide service.

So by all means get an Overland—*and get it now.*

Then, and only then, you'll make 1915 just that much bigger, better and more delightful for your whole family.

Act today.

BRIEF SPECIFICATIONS

Motor 35 h. p.
New full stream-line body
Tonneau: longer and wider
Upholstery: deeper and softer

HEADQUARTERS FOR EASTERN ALFALFA,

Central New York Alive With It.

PART II.

INOCULATION; SWEET CLOVER.—Inoculation as an aid to obtaining a good stand of Alfalfa is seldom needed. Therefore but few growers have tested it. Ordinary methods of seeding seldom even partially fail, but there is an occasional exception. Two cases were heard of in which inoculation was tried, but not thoroughly, without success. One man was found who had paid $50 for chemicals which proved useless, but who continued the old methods until he got his fields well stocked with Alfalfa. One grower got a hill producing good crops, but failed to get a stand in the hollow at its foot until he plowed the whole and dragged some soil from the hill to the low ground. One place was seen in which persistent efforts to start Alfalfa have failed from causes entirely unknown. But in most cases failure to secure a good Alfalfa sod can be traced to the use of land containing weeds or quack grass, or to imperfect preparation of the soil to receive the seed. Sweet clover is not used to inoculate the land for Alfalfa. Its one useful purpose is as forage for bees. It is generally regarded as a weed.

SEED.—Most of the seed used here is obtained from seedsmen in Syracuse. Only one variety is sold. This has been grown for a long time, and gives satisfaction. Very little effort has been made to grow a seed crop. In the few instances regarding which definite information was obtained the returns were too small to allow a profit. It is reported that a man some 10 miles from Syracuse, who goes from place to place to thrash grain, sometimes thrashes Alfalfa, but efforts to get into communication with him, or to find anyone for whom he has thrashed Alfalfa, have failed. The general opinion of Alfalfa growers seem to be that a hay crop will pay much better than a seed crop. It is not certain that the maturing of the seed would not weaken the plants. It is also doubtful whether seed produced here would be as good as that which is grown in the drier climate of some of the Western States.

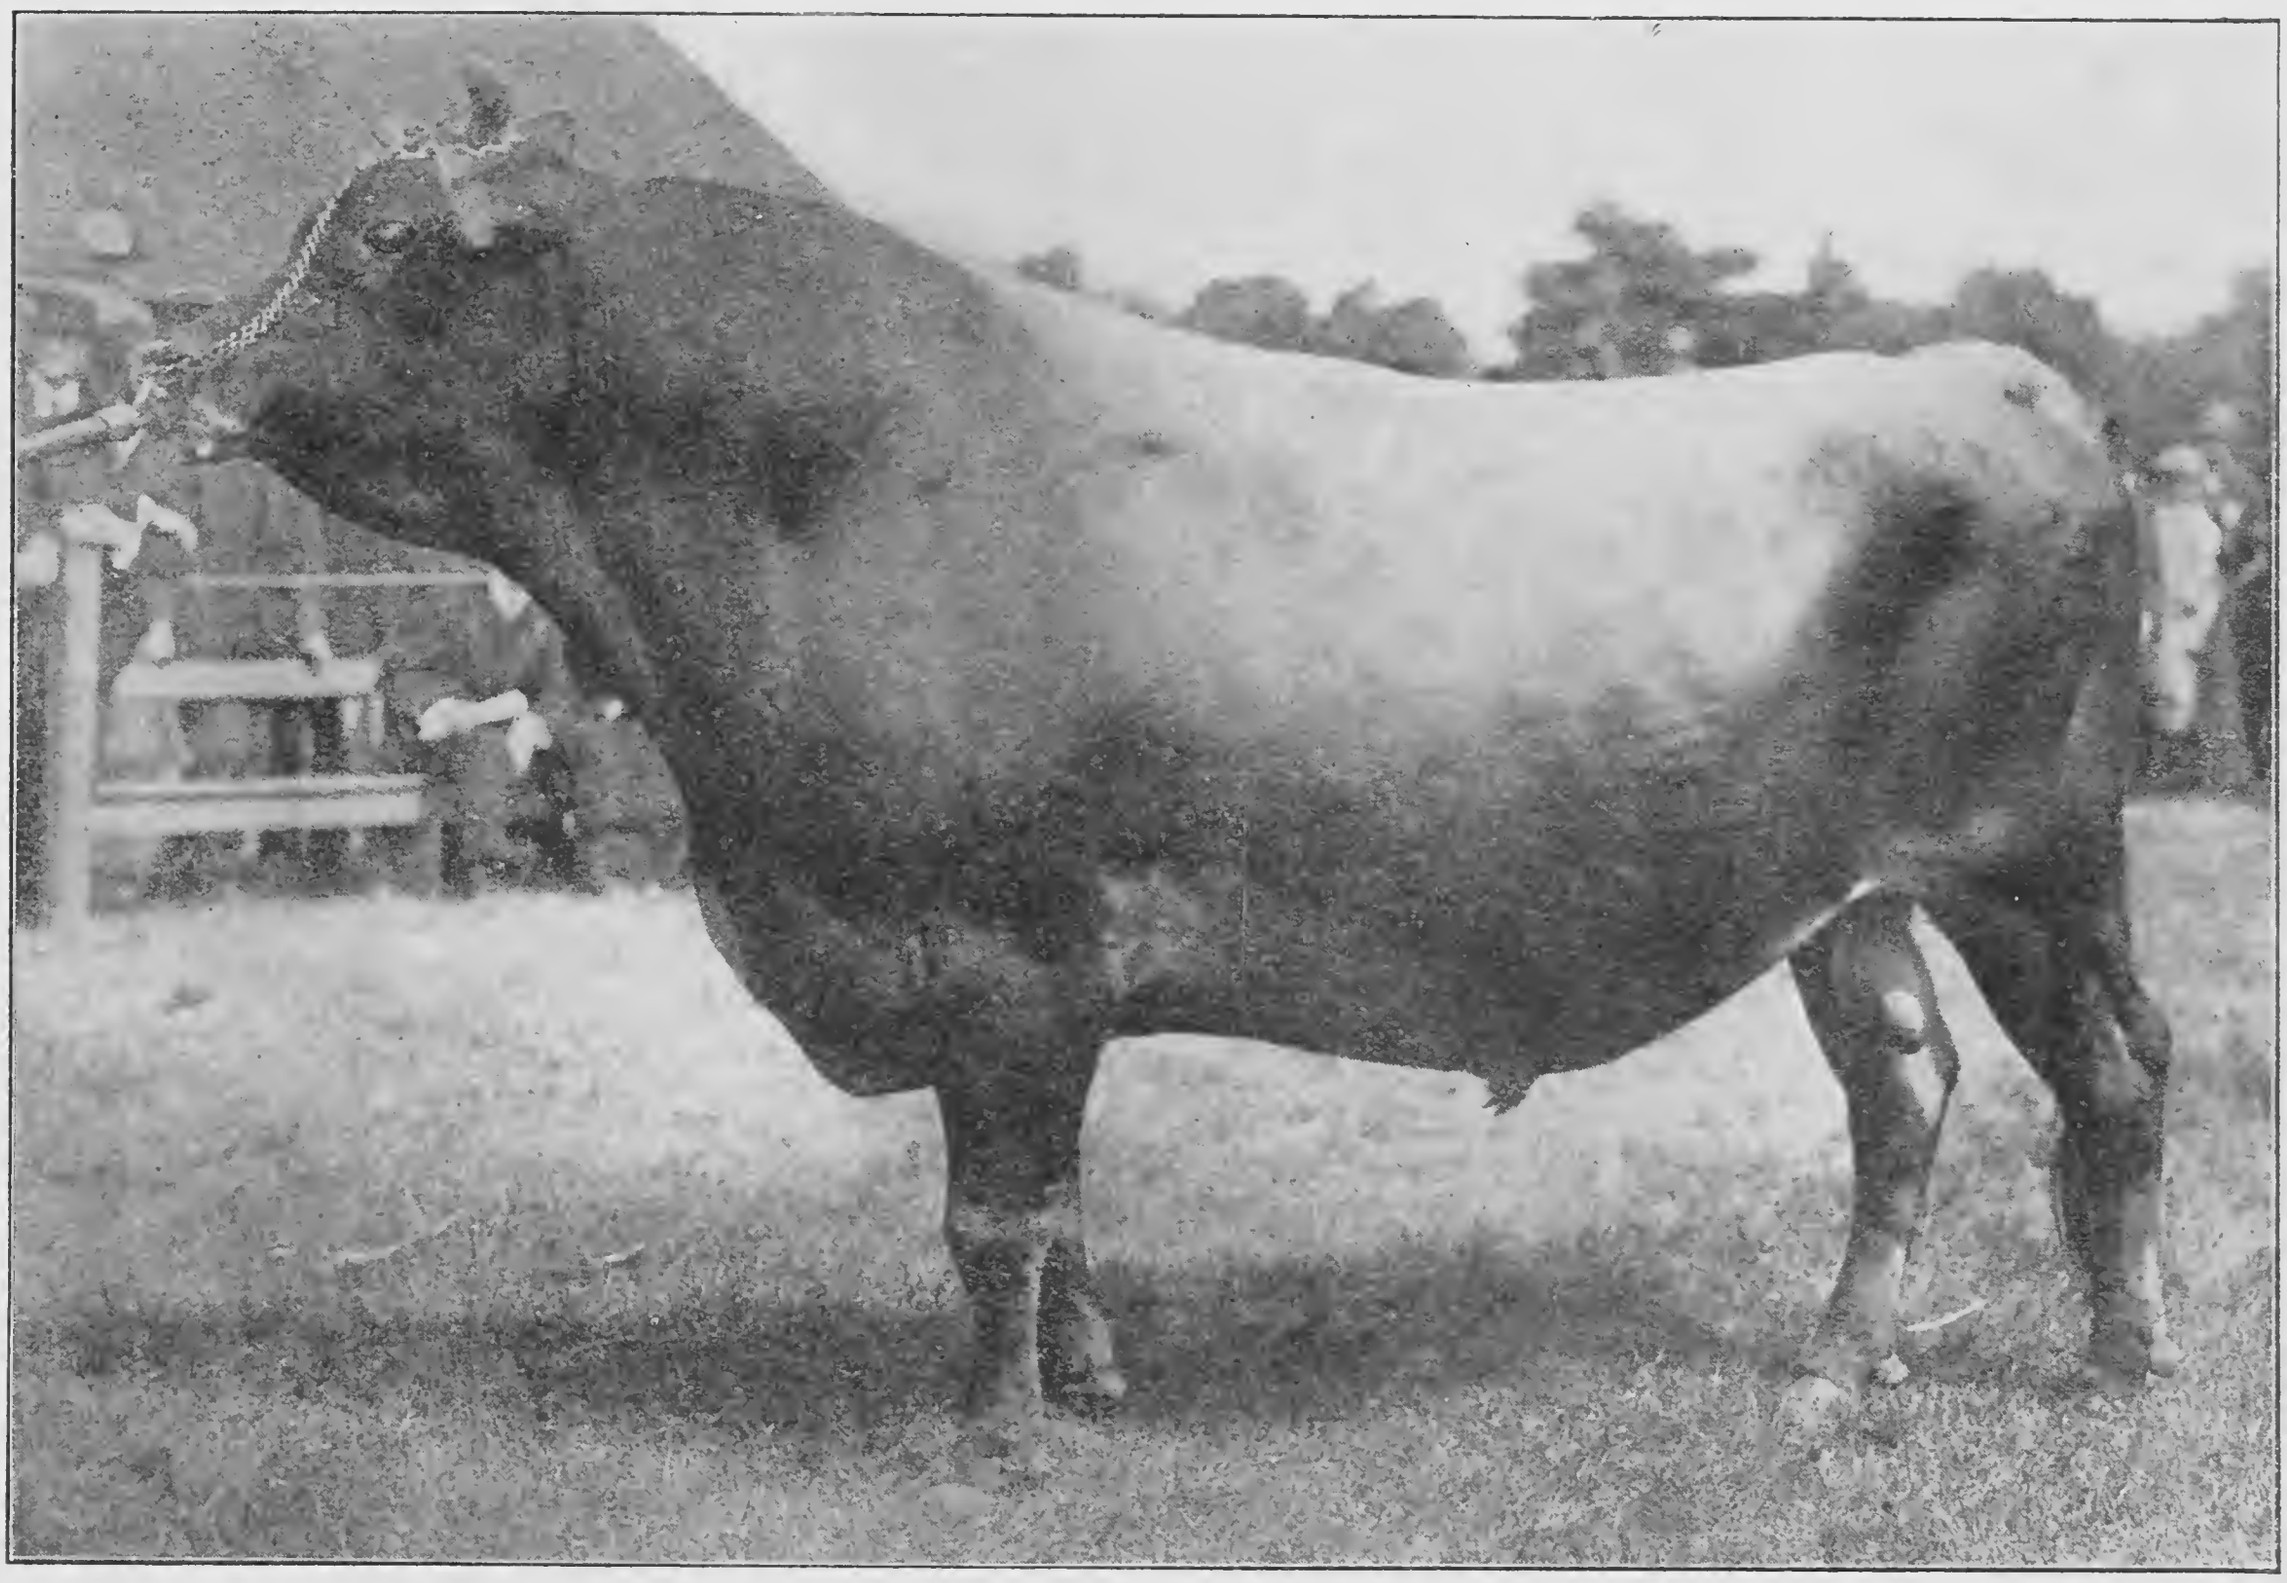
THE DAIRY INTEREST.—It is a curious fact that though Alfalfa furnishes the very best feed for cows giving milk, the dairy interest has declined as the production of Alfalfa has increased. On some farms where 20 or more cows were kept a few years ago there are now only one or two. Quite a number of farmers in Geddes are convinced that there is not only a great saving of labor but that there is also a much larger profit in selling Alfalfa hay than there is in feeding it to cows and selling milk. Still, a good many cows have been retained and some young stock is raised for sale. The Holstein breed predominates. This is an ideal locality for stock raising, and it might well become an important center of the Holstein interest.

KNOWLEDGE—BELIEF.—In various ways Alfalfa is a peculiar plant. The most experienced growers are free to say that they do not know as much about it as they once thought they did. They admit that in some respects their methods do not harmonize with the teachings of certain scientists. They are modest in their claims. But they hold to them rather than accept theories which, however plausible they may be, conflict with the teachings of remarkably successful experience covering a period of from 20 to 30 years. The most remarkable incident of this investigation was a conversation with an Alfalfa grower of considerable experience who holds the ancient belief regarding the influence of the moon upon the results of certain kinds of farm work. He firmly believes that many fields of Alfalfa have been seriously injured, and that some have been destroyed, by cutting the plants in "the old of the moon." While the moon is in this phase he will not mow his Alfalfa no matter how ready it is for the harvest or how fine the weather may be.

THE GENERAL ESTIMATE.—There is no difference of opinion as to the benefit of Alfalfa to its growers. It will not start itself, and it will not take care of itself forever, but it requires less outlay and less work than any other plant which makes anything like equal returns. It is the most permanent, the least exhausting, and the most profitable of the farm crops. Dairymen who have grown it say they "would not think they could make milk without it." A grower who sells hay says that farmers "must grow it or go to the poorhouse," and one of the largest producers gave his estimate of its usefulness by saying that "the man who has an Alfalfa plant growing has a little machine working for him day and night."

A CONSERVATIVE REPORT.—The importance of the crop has not been exaggerated. The writer has been acquainted with Alfalfa for many years. As long ago as it was merely a curiosity in the East he tested it sufficiently to prove that it would be hardy and productive in Western Massachusetts. From that time he kept informed regarding the development of the Alfalfa interest in the country. For several years he has made an annual inspection of a great number of Alfalfa fields in Central New York and of a few in the eastern part of the State where as yet only small areas are given to this crop. The men whose practice has been described and whose opinions have been stated have been producing Alfalfa for many years. There is no "zeal of new converts" on the part of the growers or the writer. The appearance of their farms and homes proves that the growers are prosperous.

J. E. R.



"KARNAK'S NOBLE. THE HEAD OF THE HERD WITH PERFORMANCE IN HIS PEDIGREE. FIG. 633.

"HEAD OF THE HERD."—The great bull shown on this page has what every bull ought to have, "performance in his pedigree." Back of him is a long line of cows which were in their time noted butter-makers. The ability to take butter fat out of grain and fodder was passed on and intensified by generations of these cows and now this bull, their descendant, passes this tendency on to his daughters. With reasonable care and selection they cannot help resembling "father's folks" in their dairy work. That is what performance in the pedigree means, making the daughter "act like father's folks."

THE FOOD AND MARKETS DEPARTMENT.

A Statement of Its Purposes.

PART II.

AUCTION MARKETS.—The department is authorized to establish auction markets in the large cities of the State; to license and bond auctioneers; to cause inspection of food products; to investigate the cost of production and marketing of food products; to hear complaints and take testimony and compel the attendance of witnesses and the production of testimony in hearings, and to enforce the observance of rules established by it for the grading, packing, storage and sale of foodstuffs within the State. The powers are ample to establish an economic and efficient medium for the movement of goods from the producer to the consumer. If the farmer and the city consumer cooperate with the department, farm produce of every kind will flow freely from one to the other at prices regulated by supply and demand. There can be no more prohibitive prices to consumers when the farmer is unable to realize the cost of delivery. If the farmer will pack and ship in accordance with the information furnshed, and if the consumer will make intelligent selections, the problem of distributions ought to be solved through this system. Of course, everything human has its faults. Market conditions sometimes change suddenly; and shipments made and the information furnished by the Department may at times reach an over-supplied market. With perishable products there must always be some risk, but this is all the more reason why the best possible information should be furnished, and experience and care should practically avoid the pitfalls.

ADVERTISING.—When grades and packs are definitely fixed and the brands established, the products of New York State farms will be advertised by the department and a demand created for them with the best trade. There are 300,000 families at the mouth of the Hudson River, that never ask the price of an article of food, if the quality and grade is good enough to satisfy their fancy. The profit of this trade has gone to the men who select and assort the goods. The department proposes to get the benefit of this trade for the men who produce the goods. It will not be the purpose of the department to cause the disturbance of any legitimate existing business; but there must undoubtedly be a readjustment of conditions in the produce markets. Otherwise there would be no reform.

EXTENT OF MARKET.—There will be more and more people to feed three times a day; and more and more food will be required to feed them. It is moreover intended to make food cheaper and more available; and in that way to increase its sale and consumption. Those dealers who are now in the farm produce business may need to change their methods; but they need not suffer from the change. While children are hungry and unnourished in New York City, food products should not be allowed to rot on the farms of the State.

THE MIDDLEMEN.—We must always have middlemen to handle produce and deliver it to the consumer. This is an economic necessity. It is a proper division of labor. Where the necessity of the middleman exists he is as much a producer as the man who works the farm. If the farmer was obliged to cart his produce from Central New York to the metropolitan market, he could seldom sell it for the cost of delivery. If the city man was obliged to go to the farms for his food, he would have no time for anything else and no money to pay for the food. It is an economic division of labor to have railroad employes, truckmen, wholesalers and retailers to deliver the food from the farm to the consumer. While the purveyors are delivering the goods, the farmer is producing them and the consumer is earning the money in other occupations to pay for them.

NEEDLESS EXPENSES.—But while the man who delivers food may be an economic necessity in its production and distribution, an excess of middlemen becomes a wasteful extravagance. For the past 20 years the delivery of goods to the New York City consumer has cost 65 cents of every dollar paid for it. This has reduced the farmer's share to 35 cents. It is believed that the department will be able to change this ratio. Its business will be to discover an economic system for the delivery of farm food products, and to find a means of delivering them within the limit of a reasonable cost. The present lines of both wholesalers and retailers that are required for this service will be encouraged and developed. No legitimate business needs to be disturbed, but an adjustment in some lines will undoubtedly be necessary. Where wasteful methods and duplication are found they must be eliminated and the agents of them diverted to productive distributing activities. Speculation in food products must be done away with.

DISTRIBUTION PROBLEMS.—We must create a free channel for the flow of food products from the farm to the city consumer. There must be delivery agents in it; but it must be free from speculative obstructions. Food that comes to the city properly graded and packed and labeled, should pass through the auctioneer's hands straight to the retailer and from him to the consumer, at a reasonable profit. Again, cold storage space must be provided in the city to save deterioration and waste, and to secure a constant and regular delivery as needed, In some situations wholesalers may be needed to furnish higher grades and particular delivery to classes of retailers. This will be a fancy trade that is willing to pay for quality and convenience; but the great bulk of trade should be disposed of in a single handling.

THE CONSUMER'S SIDE.—This marketing problem is a matter that interests any person who buys food. That involves practically every person in the State. It is not to the interest of the consumers of any particular city that the farmer loses money in shipping his produce to its markets. The city must depend on the country for its food. If the market is unsatisfactory, the farmer refuses to ship to it, or sends it only his poorest products. This results in short supply and compels the consumer to pay higher prices for an inferior article of food. If the prices are so low in the city that the farmer must let his goods rot on the ground, he raises fewer next year or none at all, and the consumer feels the result of this in higher prices. Hence it is to the interest of city consumers that the farmer find a ready market at satisfactory prices so as to encourage him to produce a steady supply of fresh graded food products.

AVOIDING WASTE.—Waste is an economic sin and all sins are harmful. The man who causes waste in time of war or peace is, economically speaking, an enemy of mankind. The man who obstructs the channel of trade, and causes food to rot on the farms while children are dying in the city for lack of sufficient nourishment is quite as responsible for waste as the man who wantonly burns a house. The individual may be part of a system which he cannot control; but the effect is the same. The individual responsibility in that case is simply transferred from the individual to a craft or to the community. Everyone who studies the subject admits the frightful waste in our system of distribution. The State has recognized the necessity of reform in the creation of the Department of Foods and Markets. Hunger produces weaklings, and sickness and crime. These again create orphanages, hospitals and prisons. They are a serious expense to the State. A sound business policy as well as a humanitarian instinct demands that we reform our system of distribution of food products. J. J. D.

MOVING LARGE FOREST TREES.

WILL you give information as to moving native trees and shrubs? I want to move some pines, hemlocks and cedars eight or 10 feet tall, and have been advised to dig around the native trees now, then move when the frost is in the ground, say in February or March. How far from the trunk should I dig the trench, and how can I lift the trees when they are frozen down at the bottom? Can I do the same way with Azaleas, laurel, and other wild shrubs? E. D. C.

Bantam, Conn.

Large evergreens from the forest are difficult to transplant successfully, even under the most favorable conditions; they usually make but few fibrous roots, and when the main roots are severed, as they must be, when moving them with a ball of earth or otherwise, the evaporation of moisture through their evergreen foliage cannot be compensated for through their shortened root system, and the tree dies, literally from thirst. I have serious doubts whether the plan suggested would prove successful with evergreens as large as those mentioned, but as the only probable expense connected with the undertaking is the item of labor, a trial planting should be made, and if the trees should not live the loss would not be great.

Before the ground freezes to any appreciable depth, dig around the trees, leaving a ball of undisturbed soil 30 to 36 inches in diameter, gradually burrowing under the tree to a depth of 18 inches or so, working toward the center from all sides, until the tree is completely undermined, after which fill in around the ball of earth with forest leaves or other coarse litter, up to the level of the surface of the surrounding ground. The tree will probably need anchoring to keep it in a vertical position. When the ball of earth becomes sufficiently frozen it may be pried out with long levers made from saplings, and loaded on a stone boat and transported by horse power to the place it is to be transplanted. The holes for the trees' reception should be prepared before hard freezing sets in and covered with a good layer of forest leaves or straw to prevent freezing. If the ground should become too much frozen to complete the filling in of soil around the trees, leaves or straw may be piled around the trees until the ground is in proper condition to complete the work.

Deciduous trees may be moved in the manner described above with very reasonable assurance of successful outcome. Their tops should be cut back at least one-third. In the removal of large or medium-sized trees from the forest to the home grounds, I prefer the following plan, which I believe is the most practical method for this work.

In early Spring dig a trench around the tree, leaving an undisturbed ball of earth two feet or more in diameter around it, varying the size of the ball according to the size of the tree, going deep enough to sever all the roots running in a horizontal direction, and cutting the end of each root severed, smooth, with a sharp knife or pruning shears. After this fill in the trench with good soil, and do not disturb further until the following Fall for deciduous trees and Spring for evergreens. Having the horizontal roots severed the trees will force out in all directions myriads of fibrous roots, in many instances completely filling the ball of earth, which will hold the soil intact almost as well as if the ground was frozen. At the time of removal the tap roots will have to be located and severed, when the tree, if not too large, may be carefully raised out of the hole by means of strong planks, or in the case of large trees with a block and fall attached to some sort of derrick, and removed to their permanent location in the same manner as directed for those with frozen balls of earth attached. Large and medium-sized forest trees treated in this manner before removal, are very much more likely to grow than by any other method of treatment, particularly evergreens.

Rhododendrons are quite accommodating in their habits, and may be successfully removed from their natural environments to the home grounds almost any time they can be dug. Wild Azaleas are more sensitive to being removed to cultivated ground and none but small plants should be selected for the purpose. The Kalmias (laurel) are very difficult to transplant successfully from the woods to the home grounds, large plants very seldom surviving removal. Small plants, however, may be transplanted with reasonable assurance of success. This transfer should be made in the Spring, and if possible the young plants should be planted in partial shade. After one year under cultivation, they may be as successfully transplanted (all sizes) as the Rhododendron. K.

FERTILIZER FACTS ABOUT FEEDS.

IF I cut a crop and feed to farm stock, and return the manure to the field, how much less humus do I add to it than I would if I plowed the crop under? Can you give the approximate fertilizer value of the common mill feeds after being fed to dairy cows? It seems to me that in order to buy feed intelligently we must know their fertilizer as well as their feeding value.

Jamestown, N. Y. R. L. S.

The following table occurs in Hopkins' "Soil Fertility and Permanent Agriculture":

Food stuffs	Per cent digested of total in food		Dry matter of food recovered in manure	
	Dry matter	Nitrogen	Per cent.	Lbs. per ton
Pasture grasses	71	70	29	580
Red clover, green	66	67	34	680
Alfalfa, green	67	81	33	660
Mixed meadow hay	61	57	39	780
Red clover hay	61	62	39	780
Alfalfa hay	60	74	40	800
Oat straw	48	30	52	1040
Wheat straw	43	11	57	1140
Corn stover	60	45	40	800
Shock corn	63	42	37	740
Corn-and-cob meal	79	52	21	420
Corn ensilage	64	49	36	720
Oats	70	78	30	600
Corn	91	76	9	180
Wheat bran	61	79	39	780

Thus, when Red clover, green, containing one ton of dry matter is eaten, only 680 pounds of the dry matter consumed will be returned to the land in the droppings. When Red clover hay is taken from the field only 780 pounds is returned when a ton is fed. In other words, a ton of clover plowed under will add nearly three times as much organic matter to the soil as can possibly be recovered in the manure if the clover is fed.

The approximate fertilizer value of the common mill feeds can be got at as follows. The Ohio Experiment Station fed 28 steers for six months. The ration consisted of wheat bran, cornmeal, linseed meal, cotton-seed meal, corn silage, corn stover, and mixed hay. Eighty-three per cent. of the nitrogen was recovered, 55.6 per cent. of the phosphorus was recovered and 97.6 of the potassium was recovered. In the table below the results at the Illinois and Pennsylvania experiments are also given:

	Nitrogen recovered	Phosphorus recovered	Potash recovered
Ohio (steers)	83.0%	55.6%	97.6%
Pennsylvania (cows)	84.6%	70.7%	91.0%
Illinois (cows)	80.3%	73.3%	76.0%

In the Pennsylvania and Illinois experiments milk cows consumed the feed so that these figures would be most suitable here. These percentages can be applied to the fertilizing elements contained in the common mill feeds and the result will be the approximate fertilizer value of mill feeds when fed to dairy cows. The fertilizing elements in the common mill feeds are given in Henry's "Feeds and Feeding." Some of these are given below:

Name of feed	Fertilizing constitutents in 1,000 lbs.		
	Nitrogen	Phosphorus	Potash
	LBS.	LBS.	LBS.
Corn meal	14.7	6.3	4.7
Corn-and-cob meal	13.6	5.7	4.7
Gluten feed	40.0	3.7	.4
Hominy feed (chop)	16.8	9.8	4.9
Standard wheat / Middlings (shorts)	27.0	26.3	15.3
Wheat bran	24.6	26.9	15.2
Ground oats	19.7	7.6	5.0
Cotton-seed meal	72.5	30.4	15.8

BOYS' AND GIRLS' CLUB WORK.

Poultry-keeping for Young People.

IN November, 1912, I took up what was called Township demonstration work, in Butler Township, Knox Co., O. The question arose, what was the best line of work for the boys and girls? The land in this township was not very fertile, and I thought the boys would not have much chance in corn club work in competition with the boys who lived in the rich corn lands. I found here quite a number of small farms, and I also found more than the usual number of poultry kept. My idea of the work is, when you find a people engaged in a work that is fairly well adapted to the environment, try development along that line. So I tried organizing a Boys' and Girls' Poultry Club. Four members were secured, three boys and one girl.

On one Saturday, so as not to interfere with their school work, a demonstration poultry house was built at the home of one of the boys (see Fig. 634,) and on another Saturday a house was built at the home of the girl. Here was another idea to teach people to utilize the resources at hand. The parents of the boy wanted to know what was necessary for the building of the house. On looking about we found some rip-rap lumber of various kinds, and an old tumble-down board fence, so that all that was necessary to buy was a roll of three-ply roofing for the roof, a roll of two-ply roofing for lining the inside, a pair of hinges, some one-inch mesh poultry netting and some nails. At the girls' home we got most of the material out of an old building (see Fig. 635), but the girl did not like its appearance, and she soon had the house whitewashed (see Fig. 636). The boys and girls and even their parents seemed somewhat surprised when I told them the hen would not ask what the house was built of or if it was painted. What was necessary to induce the hen to do her best was to make her comfortable and feed her properly.

These boys and girls kept daily records of their flocks on blanks furnished by the Ohio Experiment Station, and made reports monthly to the station. This year 10 more members were added to the club, and at the second annual show 12 of the members exhibited, one of the boys having moved away.

These boys and girls were allowed to keep one of two breeds, Single Comb White Leghorns or White Wyandottes, the object being to restrict the number of breeds and get the whole community united on color. During the year each member's plant is visited and scored, and a prize given for the best flock, yard, building and surroundings.

What good will this work be to the boys and girls? First, through the prizes offered it has resulted in introducing into their flocks some of the best utility blood in the country, and disseminating the best poultry information obtainable. Prof. Jacoby of the Ohio Agricultural College having judged the poultry each year and delivered lectures on poultry keeping. The prizes have been purebred poultry stock, agricultural papers and books.

We think there is a possibility that some of these boys and girls may develop an egg-laying strain that will rival the famous Tom Barron yards. We are having the boys and girls watch the egg-laying contest, especially the records of Hope Farm's scrubs. However, we tell them that while the editor may be experimenting with scrub chickens THE R. N.-Y. is not a scrub paper.

We took a record of nearly every farm in this township, and we found that very few farmers keep any book account of their business. In nearly every case, what information they gave us was from memory. We tried then to get each farmer to keep records of their flocks, thinking that in this enterprise the whole family would be interested, but we could succeed in getting but two families to keep the accounts for a year. In the boys' and girls' club work we are trying to cultivate in them the habit of keeping records of their work.

What we are trying most to do is instill into the minds of these boys and girls a desire to grow up to be efficient men and women, so that into whatever community they may go, that community will be the better because of their being there. We try to teach them that the value of land depends more on the kind of people that live on it than on the kind of soil.

Ohio. CARY W. MONTGOMERY.

WORK OF A GASOLINE ENGINE.

Requirements in Sawing Logs.

HOW large a saw will the ordinary gasoline engine drive through a log that is the length of the stick? Engine of six or eight horse power. A. B. C.
Carmel, N. Y.

If I understand the question you wish to know how large a saw the average six to eight horse-power gasoline engine will drive when used to cut lengthwise through the log. Other factors enter in here

BUILDING A "DEMONSTRATION" POULTRY HOUSE. FIG. 634.

that affect the power required more than the diameter of the saw does, a fast feed on a small saw sometimes requiring more power than a slower feed on a saw of greater diameter. The thickness of the saw also affects the power required, for, of course, the thicker the saw is the more wood it is required to remove from the saw kerf in the form of a dust. Of course, one does not want to go to the other extreme and give the saw so little set that it pinches in the cut.

THIS HOUSE NOT SATISFACTORY TO THE GIRL MEMBER. FIG. 635.

THE HOUSE LOOKS BETTER AFTER WHITEWASHING. FIG. 636.

The speed is also affected by the diameter, the larger the saw the slower the speed at which it is run. A leading saw manufacturer advocates a speed for the cutting edge of around 157 feet per second. To attain this speed a 12-inch saw would have to run at 3,000 revolutions per minute, while a 36-inch saw would have to run at a speed only one-third as great, or 1,000 revolutions per minute. This fact tends to balance up somewhat the power required for the various sized saws when they are to be used under the same conditions.

A saw used for ripping will require more power to operate to full capacity than would a cutting-off saw of the same size—the work is more nearly continuous and there is not the same chance for the engine to store up power in its balance wheels or the balance wheel of the saw, if it has one, that there is with the cutting-off saw with its short rests between cuts. In other words, the rip saw would do a greater amount of work in a 10-hour day than would the cutting-off saw.

The nearest to a parallel case that I now know of is a shingle saw operated by a seven horse-power gasoline engine. This saw is probably 30 inches in diameter. While talking with the owner last Fall I was told that the engine was too light, and that he wished to get a heavier power. Going to the other extreme, I know of a portable sawmill driven by a 20 horse-power gasoline engine that lags pretty badly toward the end of a tough log. It would seem that there was some fault in the adjustment here, however.

To work successfully a gasoline engine must have ample power for the work intended. It has no reserve force to fall back upon in a pinch, as has the horse or steam engine: there is no energy in an available form stored in it, it is converted from the gasoline as fast as used: therefore, while it makes an excellent power as long as it is used within its capacity, an overload even for a short time is disastrous, and it is best to err on the side of safety and have ample power for the work. R. H. SMITH.
Canton Agricultural School.

THE USE OF RAW PHOSPHATE ROCK.

"WHAT are the results and conclusions about the using of rock phosphate on land either with or without manure, as shown by the experiments at the various stations? The makers claim that by sprinkling it on manure before spreading on the fields it is made sufficiently available to give results practically as good as to use the expensive acid phosphate." R. L. N.
Harrington, Del.

In order to make a fair study of this question send for bulletins from the following experiment stations: Illinois, Urbana; Ohio, Wooster; Tennessee, Knoxville; Missouri, Columbia; Michigan, East Lansing; Pennsylvania, State College; Maryland, College Park. If the makers tell you that sprinkling this raw phosphate on manure will make it equal to acid phosphate they are simply giving you a sample of very poor "guff." They know better. Acid phosphate is made by treating this ground phosphate rock with sulphuric acid. There is nothing in the manure to compare with the powerful acid, and experiments have shown that the ground phosphate is little if any changed by the action of the manure.

In the Central West, particularly in Illinois, the ground phosphate is highly recommended by the experiment station and by farmers. It seems to give best results when mixed with the manure and put on strong land well filled with organic matter. Naturally it does not give quick results, but is used mostly in a rotation of clover, Alfalfa and grain, where much organic matter is plowed under, and where a slow, steady gain in fertility is desired. In Ohio the conclusion seems to be that while the raw phosphate gave an increase of crop the acid phosphate gave more, so that a dollar invested in the available acid phosphate was more profitable. In the Atlantic Coast States practically all the chemists and soil experts agree that acid phosphate is more profitable than the raw phosphate. This is due both to the soil and the crops. Our Eastern soils are as a rule thinner, and contain less organic matter than the Western soils. There is also less stable manure on most farms. Our crops, too, are more of the nature of potatoes, fruit or truck, which require a more available form of phosphoric acid than the raw rock can furnish.

WE have known a Thanksgiving dinner of salt pork and bread which hunger made far more tasty than any meal ever served to a millionaire.

MASSACHUSETTS FARMERS MEET.

THE meeting of the Massachusetts State Board of Agriculture for 1914 was held at Worcester, December 1, 2 and 3, and a very instructive, attractive and educational program for each day drew a large attendance. In conjunction with the above meeting was held the Massachusetts apple show, Massachusetts corn show, boys and girls' exhibits of farm and garden products and domestic manufactures, exhibits of the clean milk contest conducted by the State Board of Agriculture and the Massachusetts Dairymen's League with suitable cash awards furnished by a State grant for this purpose, and also a butter and cream show.

Taken all together it was worth going to see and study, and the large attendance showed it was a step in the right direction to have all these attractions and meeting together so everybody who wished could take them all in and go home well paid for time spent by taking new ideas with them to practice and improve on to their advantage. The lectures and debates on poultry, beef production, dairying, truck growing problems, apples, economical milk production, household accounting and canning were to the point and were well received. Many of these lectures were illustrated with stereopticon and motion pictures.

A conference of agricultural organizations on what legislation to ask for the coming session of the State Legislature caused a very lively debate and the general opinion was not to ask for any, and to bring all pressure possible to block all except a few necessary changes or amendments which might be decided necessary after further consideration and study. All agreed it was best to go slow on all and especially on milk bills. It was strongly decided to oppose the repeal of the present deer and other lately-enacted game laws, as it is reported a strong effort from some sources will be made to accomplish this.

The annual meeting of the Massachusetts Dairymen's Association was held directly after the afternoon lecture on the second day and the president, secretary and most of the other officers were re-elected, which means the continuing on of the present year's good work for the coming year also, and if the State grants the money which it probably will if asked to, another clean milk contest will be a feature of next year's program along the lines of this year's success.

The corn and fruit judging caused lots of study as good or extra good exhibits were the rule rather than the exception, and much conferring was indulged in to decide which specimens were the best deserving of the ribbons. While few really perfect ears were there, yet taken as a whole the corn exhibits were really more than good; they were excellent for the present season, which was a bad one for properly pushing the growth and properly maturing the ears. A finer collection of apples it would be hard to find, and much comment on this was heard. It is pretty late in the season to have Gravensteins in good condition to exhibit, yet these were much in evidence and in fine condition, too, and it was stated they had not been in cold storage either, which many considered very remarkable. The Spys were also worthy of mention as all specimens seen there were very fine, as good looking as any Western apples I ever saw. It would not be fair to forget to mention the Blue Pearmain, which was shown of excellent quality, and speaking with Prof. Brooks, of the college, about these he thought it strange so good an apple was not listed as the rule in fruit catalognes. It is really, he said, one of the good old-fashioned apples which was and is good, and it seems a pity not to continue these and the old Pumpkin Sweets, which had a flavor never to be beaten or forgotten.

The samples of strainer cotton through which the milk from the various contestants had been strained showed very little sediment or discoloring as the rule; most of these were very clean which shows there are many clean dairies in Massachusetts. The condition of the milk on exhibition proved this also, as it had all been milked over a week before it was placed on exhibition at the hall. No one could tell if he did not know this that it had been not milked the day before. The butter was all farm made and of excellent quality.

The boys' and girls' exhibits especially of domestic cooking, were very attractive, and received the praise they richly deserved; all of these were very fine. The boys' stock judging contest, which was billed to take place on the afternoon of December 3, was not allowed on account of the foot and mouth disease quarantine. The annual meeting of the Massachusetts milk inspectors was held on the 3d. I attended this expecting to see and hear some lively talk on the subject of milk, but a quieter lot of lambs I never met. At the meeting of about two hours' duration nothing came up to cause a ripple or disturb the quiet. The election of officers and a little other business was all they accomplished; perhaps they were saving their energy for the farmer. A. E. P.

NEW JERSEY HORTICULTURISTS.

CO-OPERATIVE marketing, advertising, spraying experiments, overhead irrigation, the growing of nuts, strawberries and grapes, and spray experiments on potatoes, were features of the program of the fortieth annual meeting of the New Jersey Horticultural Society, at New Brunswick.

A. M. Seabrook, of Cumberland County, who has over 75 acres of his property under overhead irrigation, said: "The installation of the system costs from $125 to $150 an acre, exclusive of pump and mains. Where we did not have the system installed, the crops were less than one-third as great as where the plant is in operation. Overhead irrigation saves cultivation, reduces insect pests, more than doubles the yield, provides for quick succession of crops, and enables the grower to produce vegetables of superior quality."

J. C. Hendrickson, of Monmouth County, said that an abundant rainfall is essential in growing the eggplant. "It is important that the soil should be free from bacterial wilt, and this will persist in the soil four or five years. A rich sandy loam soil is best location, and an old asparagus plot is very good. It should be set in quite damp soil and the earth firmed with the hands, but not too compactly against the stem. Manure should not come in contact with the plant. We use a handful of ground fish or tankage; it is scattered along between the rows, and cultivated in.

Theodore Brown, of Gloucester County, described two blight-resistant varieties of potatoes which were generally planted in his locality. "The Hoosier or Pink Eye will grow under rather adverse conditions," Mr. Brown said, "and another variety is that from Cape May. They have been grown there for 35 years. Their quality is so good that when our markets become acquainted with them they will demand them in preference to other varieties. This latter variety may be planted after the first of July and is very prolific."

Frank Jones of Monmouth County, who is co-operating with the State of New Jersey in spraying experiments on potatoes, said: "There is no mixture which will destroy the flea beetle. I would say it pays better to spray with home mixed rather than the commercial Bordeaux mixture as the home made is applied when hot. The operation of spraying costs 40 cents an acre; with commercial Bordeaux $1.60, the home-mixed $1.15. Arsenate of lead costs 80 cents."

Prof. J. B. Norton, of Washington, described the efforts of the government in producing rust free asparagus. He said in part: "The rust problem will be greatly reduced as soon as we eliminate such old varieties as Moore's Cross-bred, for these are very susceptible and succumb to blight readily. I would not burn over the bed, for it needs all possible humus. We are not only trying to produce a rust resistant asparagus, but we are endeavoring to secure a strain that will yield more to the acre. It is impractical to try to dig out those plants which suffer from rust, as it already has a start of a dozen days. Keep all plants on the edge of the field cut down, as pests inhabit these and spread throughout the field. It will pay the New Jersey growers to put up their asparagus in the same way as the Massachusetts growers, and they will be able to secure the same figures in the Boston market." W. J.

Horse Chestnuts.

WILL you tell me if horse chestnuts have any use? T. R.
Raymond; N. H.

The nuts or fruit of the horse chestnut contain a substance known as esculin, which is sometimes used in preparing medicines for rheumatism or malarial disorders. As most people know also, it is an old-fashioned belief that a horse chestnut carried in the pocket will prevent an attack from rheumatism or hemorrhoids. Needless to say, we do not recommend the horse chestnut for the cure of these troubles, although no harm will be found in carrying the nuts in your pocket. Its use as medicine is insignificant.

Soil for Growing Chestnuts.

PROF. AHEARN of the Kansas Agricultural College tells how to prepare soil compost for growing plants: The way to handle the old pasture for farm crops is to give as good an imitation of this as you can with farm tools:

"A workable soil may be made from loam, sand, and manure, but it will be greatly improved if leaf mold or peat is added. The best loam for plants is made of well-decayed sod taken from a pasture. After the grass has been killed by hard freezes in the Fall, the sod should be cut three or four inches deep and placed in a pile, the grass side down. For the sake of convenience, make the pile three or four feet wide and as high and as long as necessary. Hollow out the top so as to catch the rains. If the year is a dry one, a garden hose may be used to supply the moisture. In the construction of this pile, alternate layers of sod and manure should be used. This compost should be allowed to weather for at least a year, preferably two years, before being used. When ready to be used, it should be chopped and thoroughly mixed with well-rotted manure."

"In my 35 years of fruit-growing I have never seen a peach that will make so much money for the grower as the J. H. HALE." —William P. Stark.

The J. H. HALE Peach 53 Days After Picking

Identical specimen kept by Mr. W. P. Stark in an ordinary ice-box for 53 days

Here in this record-breaking J. H. HALE Peach is the peach fruit growers have long been seeking. Not alone for its gigantic size (one-third to one-half larger than Elberta), but for its amazing keeping and shipping qualities. In this respect it surpasses them all.

J. H. HALE peaches shipped in competition with Elbertas have invariably kept two to three times as long. Their firmness permits packing and shipping almost like apples.

No Peach Before with All These Features

Immense size like small cannon-ball.
Round, globular shape.
Golden yellow flesh, carmine tinge.
Perfect freestone—meat of a cling.
Firm, yet delicate texture.
Smooth skin—*practically fuzzless.*
Ripens 5 days ahead of Elberta.
Will hang longer on tree.
Wonderful keeper and shipper.
Matchless for canning.
Brings 25 to 50% higher prices.

Shrewd fruit-growers are jumping at this opportunity. From California comes a call for 14,000; from Arkansas for 10,000: from New York for 5,000. Reserve your trees now! Hundreds ordered too late last year. Be first in your section.

Beware of Fraudulent Trees

You can get genuine J. H. Hale peach trees, budded from Mr. Hale's bearing orchards, *only* from Wm. P. Stark Nurseries. Be on your guard. Dishonest persons are offering an old, worthless, small peach known as "Hale's Early" for the true J. H. Hale. *Refuse them—they are fraudulent.* The J. H. Hale peach is trade-marked and grown by us under an exclusive contract with Mr. Hale, who has appointed us *sole distributors.* Order *genuine* J. H. Hale trees *only* from Wm. P. Stark Nurseries.

Only Trees Bearing This Tag Are Genuine J. H. Hale Peach. Look For It.

INSIST ON YOUR DEALER FURNISHING SEED OATS IN BAGS BEARING THIS TAG

Fancy Recleaned
SEED OATS
FROM
TIOGA MILL & ELEVATOR CO.
WAVERLY NEW YORK

FRONT

These are SELECTED STOCK from which false oats, light oats and pin oats have been removed leaving only the best heavy oats. They have been recleaned to remove foul seed and dirt and before shipment have been tested to insure high germinating qualities.

If you plant oats to raise oats and get the largest returns for your work and investment, it will pay you to plant only seed that will grow and produce strong plants. False and light oats will not grow, and pin oats grow pin oats. Good oats with strong germinating qualities produce stronger plants, insuring larger returns.

Christmas Ideas from Europe

THOUGH Europe may be at war, still there are minds which must evolve Christmas ideas, and as long as Paris remains Paris, she must display the little arts and dainty femininities of a beauty loving people.

"But yes, mademoiselle, this is just the thing for the mademoiselle who gives luncheons," I was assured in one of the prettiest shops in Paris. This dear little French morsel of petiteness was showing me a number of delicate shades for the candelabra or candlestick and immediately I thought of a friend who entertains a great deal, and knew I had hit upon the Christmas gift that would please her most, I decided to make these for her myself.

CANDLE SHADES.—One can buy in any of the department stores or shops handling shades of different kinds, wire or paper frames. Get several of these for a set, say three or four. Purchase a very sheer silk of plain color or figured design; for instance, for a violet luncheon for Spring, a faint-hued violet silk may be purchased. After the frame is covered with silk, if you are handy with your brush, paint on the silk shade deep-colored violets and a few leaves. For a rose luncheon, a dainty silk with rosebuds will make exquisite shade-decorations. Any number of wonderful ideas can be worked out from this. One pretty little shade which I saw was made of a delicate old rose silk on a very unique frame, while all around the lower edge of the shade were festooned chains of

DAINTINESS IN CANDLE SHADES.

gold and old rose beads. An exceedingly pretty set of shades was made by winding the wire frame first with narrow strips of silk and then sewing on shirred silk wide and long enough to cover the frame. Over this was placed a covering of gold net and the top and bottom edged with narrow gold lace. Another set of yellow silk shades was singularly attractive. A border of very daintily fashioned chiffon roses of the same yellow was fastened about the top and bottom of the shade and a tiny fringe of black beads gave an exquisite Frenchy touch to this.

HAND-BAG.—The newest thing in hand-bags from Paris is made of a white or black satin or silk corded material with roses appliqued or embroidered upon them. These plain hand-bags may be purchased at any department store at very little expense, if you do not care to make them. Cut roses or wreaths

EMBROIDERED HAND-BAG AND BOUDOIR SLIPPERS.

from a fairly heavy silk or satin, and padding them slightly with cotton, applique them on the front of the bag. These may be embroidered if preferred.

COLLAR AND CUFF SET.—One collar and cuff set that mademoiselle showed me I know appeals also to the American girl. This may be made of the sheerest organdy or net. Procure a good pattern of modish shape and with very little trouble, the edge may be scalloped very dainty. Then embroider little wreaths of forget-me-nots on the collar and cuffs; this may be done in blue and green or any color desired. The collar is wired and when they are finished they would delight the heart of any feminine friend.

BOUDOIR SLIPPERS.—"The very thing for Eloise," I exclaimed and as the ma-

EMBROIDERED COLLAR AND CUFF SET.

demoiselle showed those dainty boudoir slippers I thought of a friend who was preparing her trousseau, and decided at once what I should give her. To make these comfy slippers buy a pair of soles of the correct size and enough ribbon of the desired color to encircle the soles. Join the ends of the ribbon firmly and whipstitch to the soles. At the top of the ribbon, stitch a band of half-inch ribbon and thread with elastic between the ribbon and the band, drawing this snugly about the instep. Then get a piece of white marabou and tack around the top of the slipper, letting it run down the front, part way to the toe, and fasten with a little cluster of roses of the same color as the slipper; or if the slipper is a delicate blue, use roses of a delicate pink. For another suggestion, fashion a pair of dainty "mules"; select a pair of soles of the size desired and to the front, stitch vamps formed of brocaded satin or ribbon. Around the edges of these use either a colored or white marabou or little roses to harmonize. Any of these things may be made as fine or as inexpensively as you choose and in spare moments or evenings before Christmas.

HELEN GARY ALLINGHAM.

The Woman At Law

[Under this heading we shall discuss the legal rights of women, particularly as regards thier property and their children. There will be direct answers to actual questions and general statements of law.]

Return of Deed.

I SOLD a farm of 60 acres about seven years ago, and when the agreed time expired, I could not get my money, so had to foreclose the place. Through a sale in September the place fell back to me. I have just now received a deed that does not correspond with my old deed. Am I entitled to my old deed? Are they duty bound to give it to me?

New York. C. O.

You having given a deed to the purchaser, your title to this property now comes through him, and whether it is good or not depends upon the foreclosure proceedings. The old deed is of no use now; it really belongs to the person to whom you gave it, and you are not entitled to it. The present deed should certainly contain a proper description of the property, whether it corresponds to the old deed or not.

Rights in Wife's Property.

A'S wife has in her name, a farm with all the buildings, tools, machinery, stock, etc., free and clear, in New York State. She wants to make a will leaving everything, unconditional, to her husband, after her death. They have two sons, nearing the age of majority, who are in different vocations. The question is this: If she leaves everything to her husband, can the boys demand any part of the mother's property after her death? Also; in case she made no will at all, would the property go to the husband after her death? A has been informed that if no will was left, the two children would get all the property, under the New York laws, while poor father would or could be, if the children choose, turned out of his home. D. D. D.

New York.

The wife may by will leave all her real and personal property to her husband and the boys would not be entitled to any part. In the absence of the will, at the death of the wife, the husband would have his courtesy of a life interest in the real property which on his death would go in equal shares to the boys; and the personal property would go one-third to the husband and the balance in equal portions to the boys. So, in any event, the husband could not be entirely left out.

EVENTS OF THE WEEK.

DOMESTIC.—Despite assertions by the Standard Oil Company that it is the real owner of the tank steamship Leda, captured on August 8 by the British cruiser Suffolk near Bermuda, the Supreme Court of the colony has declared the ship to be a German, and has condemned her "as a good and lawful prize." The State Department probably will be asked to make representations to the British Government in behalf of the Standard Oil Company, and unless these are successful the ship will be sold at auction. She is a new vessel, worth perhaps half a million dollars. She was owned by the Deutsch Amerikanische Petroleum Gesellschaft, having been built in Germany and hailing from Hamburg. She carried a German master and crew and flew the German flag.

The business section of Ardsley, N. Y., was wiped out, Dec. 6, by a fire which killed a family of four, injured half a dozen men, and burned the homes and total possessions of about 80 persons. The loss is estimated at from $100,000 to $200,000.

The plant of Thomas A. Edison, Inc., where the great wizard worked out practically all of his wonderful inventions, was destroyed by fire, Dec. 9, only three buildings being saved out of 22. The loss as announced by Mr. Edison, is $2,000,000, and is entirely uncovered by insurance. It was located at Orange, N. J. Two lives were lost.

President John McLennon of District No. 5 of the United Mine Workers of America announced, Dec. 7, after a conference with the international officers of the organization, that a resolution would be offered, Dec. 7, to the special convention of the Colorado miners, at Denver, to end the strike. The strikers will return to work under the terms of the three year peace plan outlined by President Wilson and will demand that the Seth Low mediation committee enforce the terms of that proposal.

Thirteen miners were killed at Scranton, Pa., Dec. 9, when one of their number dropped a stick of dynamite while descending into the Tripp shaft of the Lackawanna Coal Company. The explosion destroyed the cage, and the men fell to the bottom of the shaft. One man saved his life by clinging to an iron rod.

A Ninth Avenue local elevated train carrying hundreds of passengers toward their homes in Harlem crashed into an express train standing at the 116th street station, New York, Dec. 9. Two men were instantly killed and in the panic that followed when the wooden cars which bore the brunt of the impact took fire scores were injured.

Dec. 6-7 much damage was done along the Atlantic Coast by storm and high tide. At Seabright, N. J., the estimated loss to property was $150,000. At Sea Gate, on New York Bay, the damage was about $35,000. There was much damage to shipping, and the full damage along the Jersey coast is reckoned at over $1,000,000. A conference has been called to meet at Trenton including important officials and private citizens, to consider means of controlling storm damage on the Jersey shore. The State Legislature last Winter passed a law authorizing seacoast municipalities to issue 40-year bonds to an amount not to exceed $100,000 to build jetties and bulkheads. Many towns have taken advantage of this statute and the walls have been built. But this storm damaged these bulkheads and in many instances washed sections away entirely. In South Jersey more than one set of railroad tracks have been washed away and it has become necessary to change the lines.

THE PRESIDENT'S MESSAGE.—Dec. 8 President Wilson read his message to Congress, national defence being the chief theme. He urged the development of the National Guard, and the training of citizens in the use of arms, but decried the efforts of some citizens to alarm the country over its military unpreparedness. He referred to the immediate need of an adequate merchant marine, the lack of which is now hampering trade, and urged the passage of the pending shipping bill. Referring to rural credits, the President said: "The great subject of rural credits still remains to be dealt with, and it is a matter of deep regret that the difficulties of the subject have seemed to render it impossible to complete a bill for passage at this session." Philippine independence was touched on; the international convention for safety at sea already confirmed by Great Britain and Germany, and awaiting acceptance by the United States; the adequate charting and survey of our coasts, and also the need for economy in government expenditures.

FARM AND GARDEN.—Isaac H. Odell, commission broker of White Plains, N. Y., was fined $500 in New York Special Sessions, Dec. 3, for having condensed milk so impure it exploded. Inspector O'Keefe of the Health Department testified that on October 10 he condemned carboys of milk which Odell stored with the Heermance Storage and Refrigerating Company. The carboys were removed to an offal dock for disposal and there several fermented and burst, he said. According to the testimony the explosive milk shot 50 feet into the air and showered bystanders.

The regulations governing the shipment of hay, straw, and similar articles from States quarantined on account of the foot-and-mouth disease have been modified so that hay cut before August 1, 1913, may be moved freely without reference to the time when it was baled. Hitherto it was required that in addition to being cut before August 1 the hay should have been baled before October 1. The provision, however, that since being cut the hay should have been stored away from all cattle, sheep and swine, remains in force. In the case of hay that has been cut since August 1, or which has not been kept away from contact with any possible source of infection, disinfection under federal supervision is required. This disinfection should be accomplished by fumigation with formaldehyde gas.

The annual meeting of the Oregon State Horticultural Society was held at Medford, December 2-4.

Dec. 7 Senator Pomerene of Ohio introduced a resolution in the Senate directing the Committee on Agriculture and Forestry to investigate and report fully on the extent and efficiency of the recent cattle quarantine. Delegations from Iowa and Ohio have protested vigorously against the quarantine.

Secretary Houston issued an order, Dec. 7, effective at once, under which the Federal quarantine in New York and other States, declared on account of the foot-and-month disease among livestock, has been modified. The effect of the amendment is to permit the interstate movement of all livestock from outside the quarantined area in New York, except the counties of Erie, Niagara, Orleans, Genesee, Monroe, Wayne, Ontario, Seneca, Cayuga, Cortland, Tompkins, Saratoga, Washington, Rensselaer, Albany, Schenectady, Columbia, Suffolk, Nassau, Richmond, Bronx, Kings, Queens, Rockland and Westchester. These counties are still subject to Federal quarantine. The modification will permit the movement of dressed carcasses, hay, straw and similar articles hitherto subjected to quarantine regulations. Similar modifications were made as to Indiana, Michigan and Maryland with certain counties excepted.

Florida farmers are alarmed over the threatened destruction of their grapefruit orchards through the ravages of an Oriental canker, which devours slowly but surely trunk leaf and branch of the trees, and against which, according to the experts of the Department of Agriculture, there seems to be no defence. Thus far the growers have tried to stop the spread of the pest by burning trees it has attacked, but this has proved ineffectual.

Short courses in agriculture will be held at the New Hampshire College, Durham, N. H., as follows: "Renovating Old Fields for Hay and Forage Crops," one week, beginning Jan. 4, 1915; "Grain and Potato Growing," one week, beginning Jan. 11; "Apple Growing," one week, beginning Jan. 18; "Small Fruits and Poultry," one week, beginning Jan. 25; "Farmers' Week Course," one week, beginning Feb. 1; "Course in Dairying," five weeks, beginning Feb. 8.

THE EUROPEAN WAR.—Dec. 3 a hostile aviator dropped bombs upon the Krupp cannon factories at Essen.....Dec. 5 French aviators dropped bombs on the aviation hangars in Freiburg, Germany.....Dec. 7 a German aeroplane dropped bombs on Hazebronck, Belgium, killing several civilians.....The Allies assumed the defensive, Dec. 5-10, on their left wing in Flanders, and on their right in Alsace. The French and British artillery has been much strengthened, and the Allied fleet is cooperating with land forces, Zeebrugge being again bombarded. The French have captured Vermelles, in Northern France, and maintain positions taken in Alsace and Lorraine.....Advices from Rheims Dec. 8 announced further damage to the Cathedral from German bombardment. .....Dec. 8 a British squadron under command of Vice-Admiral Sir Frederick Sturdee, chief of the war staff, engaged a German squadron under Admiral Count von Spee off the Falkland Islands, in the South Atlantic. The armored cruisers Scharnhorst and Gneisenau and the protected cruiser Leipzig, three of the German warships which had been menacing British shipping, and part of the squadron which sank the British cruisers Good Hope and Monmouth in the Pacific on November 1, were destroyed, while the cruisers Dresden and Nurnberg, the two other vessels which composed the German squadron, made off during the fight, the Nurnberg being captured later, the Dresden's fate uncertain. Two colliers were captured. The British loss was very small.....In Poland, Dec. 6, the battle line extended 300 miles. The Russians were then bombarding Cracow. The Germans had secured important successes around Lodz, the Russians evacuating that city.....It was reported, Dec. 10, that the Kaiser was seriously ill at Berlin.....The Boer revolt in South Africa appears to be generally crushed. Gen. De Wet is a prisoner, liable, under existing law, to the death penalty. Gen. Beyers attempted to escape from his captors while crossing a river, and was shot and killed.....Australian and New Zealand troops have been landed in Egypt, where they will complete training for European service.....Japanese veterans in Hawaii have been called to the colors, and it is reported they will be sent to Egypt and India.....Indian troops have defeated Turks in Persian territory.....While it is freely asserted that Italy is prepared to join the Allies, a persistent report states that she has been offered the Trentino, an Austrian province populated by Italians, as the price of neutrality.....Dec. 9 the Servians claimed victories over Austria.

OHIO CROP REPORT.

THE Ohio Agricultural Commission reports thus on the condition of crops December 1, 1914:

Wheat—Compared with an average, 97 per cent.; amount sold as soon as thrashed, 43 per cent.; damaged by Hessian fly, 5 per cent.; damaged by white grub, 1 per cent.

Corn—Area planted in 1914, 2,901,070 acres; estimated average yield per acre, 37 bushels; total estimated production, 107,463,240 bushels; put in silo, 11 per cent.

Clover—Area sown in 1913 cut for seed, 33 per cent.; average ield of seed per acre, 1.59 bushels.

State Average Prices.

	1914.	1 year ago 1913.

Uncle Sam Uses HARDER SILOS

And Keen-sighted Dairymen Follow His Example

HARDER SILOS are used by the National Government and many State Governments and are recommended by dairy authorities everywhere. Why?

1. Because Harder air-tight, non-conducting walls are a positive assurance of sweeter silage. Sweeter silage means more milk and **greater profits.**

2. Because the Harder Door System makes this the most easily and safely operated silo in the world. No spoiled silage, no sticking doors, no danger of fall or accident, with costly damage suit.

3. Because the Harder Spline-dowel System and the Harder Anchor System make it solid as an oak—no leaning or swaying—absolutely storm-proof.

For 16 years the Harder Silo has been the

Cheapest and Best

The Harder gets the most out of your corn crop. It means healthier cows. It is easiest and cheapest to put up, and most economical to manage. It is the most durable. No tile or concrete silo can show an equal record for durability.

Write for free catalog, also for the interesting story of "Silas Low," which tells of the distinctive Harder features.

HARDER MFG. CO.
Box 11 Cobleskill, N. Y.

The Best Thing About Christmas

—It makes you want to make people happy.

The best thing about the *Ingersoll Watch*—

It gives the utmost happiness that a Dollar can buy, and reminds the owner of the giver all year round.

Thousands of men, women, boys and girls are hoping that Christmas will bring a new watch.

How many people will you make happy on Christmas morning?

Give an Ingersoll Watch to Father, to Mother, to Sister, to Brother—give one to each of the boys and girls to make their eyes sparkle on Christmas morning.

Give an Ingersoll Watch to each member of your Sunday School class—to each of your employees—nothing else can give so much pleasure and service.

Sold at One Dollar in 60,000 stores all over America—the biggest dollar's worth of happiness that Christmas can bring.

ROBT. H. INGERSOLL & BRO., 315 Fourth Ave., New York

:: Hope Farm ::

"At Christmas play and make good cheer
For Christmas comes but once a year."

LOOKING over some old books I found this from "The Farmer's Daily Diet," by Thomas Tusser. It was written about 1560, and has kept alive through 354 years. If you smile at the rhyme ask yourself how many of your own words will be remembered 50 years hence! It is very evident to me to-night that Christmas is coming. We have had our first snowstorm—a little thing just turning to rain—but enough to whiten the ground and relieve the melancholy gray of the landscape. Now is the time to get out the copy of Whittier and read "Snow Bound." My children read it and think they understand, but in these days of electric lights, water conveniences, telephones and all the rest who, without experience, can ride imagination back to one of these big farmhouses on a windy hill, with only one stove, and shut off into solitude by the storm? It was in such lonely places that the true Christmas spirit was bred. It is one of the things that never can be taken out of the human race. Men who call themselves wise and imagine themselves great, may ridicule the old story and think they can turn the world away from it, but they get nowhere in the end. If they think otherwise let them look into this room to-night and watch the group of children. The open fire is blazing up. I am writing on a board laid across the arms of the chair, so as to be close to the fire. The children are scattered about trying to make rude gifts, or figuring what they can buy out of their little hoards. It seems that they have found "Santa Claus" in the dictionary as "the friend of children." That settles it with them, for is not the dictionary the last resort? It is Christmas. *Christmas!* The great beautiful day of all the year, and already on lonely farms and in solitary places, there is a glow and presence in the air which beats down all the arguments of the cynics and the "great thinkers." Before our fire to-night the children and I are sorry for those unhappy wise men who have lost so much out of life. They might well go star hunting as other wise men did before them.

EVERY DAY.—Old Thomas Tusser tells us that this beautiful holiday "comes but once a year." True, there is but one date on the calendar, but I think one great trouble with the world is that we are too ready to agree with old Thomas. I do not believe in airing the Christmas spirit once a year with great parade and show, and then packing it away in the closet with the wedding garment, the family skeleton and several good resolutions. If we are to celebrate the birthday why not also every day as we go along? You see this world of ours is an everyday affair—not a matter of holidays alone, but of plain, common days, during which people need our love and care far more than on the great feast days when all hearts are aglow. It is a standard joke that the attendance at Sunday school for the month before Christmas is abnormal—as the children all look for a present. Some of us who are gray-haired have worked this joke out into a serious practice of life. I do not believe in expensive gifts at Christmas—little tokens of remembrance are far more in keeping with the spirit of the day. I would rather scatter the gifts through the year when they are most needed. Here I know I strike at habit and long-established practice, but that has been done before. It seems to me that something vital comes out of the beautiful holiday when we lead our children to expect so much of material things at Christmas. I would associate the holiday with small tokens of love and give the larger gifts as they are needed through the year. I know how most people regard this. Long ago Shakespeare said:

"At Christmas I no more desire a rose
Than wish a snow in May's new-fangled mirth
But like of each thing that in season grows."

Or Byron who said:

"As soon
Seek roses in December, ice in June."

That was sound enough when he wrote it but what would my lady say to it now? What about the florists with their millions of dollars invested in the flower trade? We have carried May under glass right up to Christmas and in the cold storage houses we have carried Christmas right into May. If we do this with the material things of life why not with the spiritual things—the leader of which is what we call the Christmas spirit? Can we not have something of a Christmas tree in the wet ditch, the hot cornfield or the cold ride to market?

MATURE YEARS.—If I had the power to do so I would hang some Christmas gifts on your tree that would last all through your years. Take the men and women of mature years first. I would have you fully understand the meaning of Emerson's saying:

"*We do not count a man's years until he has nothing else to count.*"

Now the world needs the sum and the essence of your life's experience. People of your age do not need it half so much as the younger generation. It is only through these younger people that you can hope to pass on what the world has given you. The only way you can pass it on is to hold on to something of the spirit of youth. I would like to give you a broader and fairer charity for youth and its ambitions. Too many of us become absorbed in our work or even in our prejudices and cannot realize that life has changed. There are roses now at Christmas and we should not wonder if our children long for them. We agree that we cannot profitably farm now as was done 40 years ago. It may be a part of the Christmas spirit to realize that we cannot handle our children now just as we were handled. My gift to you would be a kindly and broad philosophy which will cut prejudice away from truth as rust is taken from iron. As for the young—have they not *youth*, which we know is the most precious thing of all? Do we not also know that they cannot realize its value until they have lost it? It will not be a popular gift if I tell these young people that I sincerely hope they will be forced to *work hard* for their place in the world and that no one will curse them by leaving them a fortune so that they never will feel the sting of necessity. Some people think there is poison on the sting of necessity. Not so, it carries power—not poison.

"Son, have too much yet still do crave.
I little have and seek no more.
They are but poor, though much they have,
And I am rich with little store.
They poor, I rich; they beg; I give.
They lack, I have; they pine, I live."

THE BETTER WAY.—I could give our farmers no finer present than the convincing thought that we must carry the spirit of "*good will to men*" into every-day life. I think we have now come to the point in history where we realize the business evils which have made the 35-cent dollar possible. It ought to be evident to all of us that we cannot permanently increase the size of this dollar through fraud or fighting or through politics. The remedy lies in the gentler, truer practice of the Christmas spirit. Instead of trying to "do" our neighbor or the man with whom we do business we must give him what is honestly his due. Think of it for a moment. Every business interest which handles and sells our produce is organized. How can we expect as individuals ever to stand for our rights against these powerfully organized interests? How can we ever expect to co-operate with others unless we can learn to carry this Christmas spirit right into every-day life each day in the year? If there is distrust between you and your neighbor so that you cannot co-operate, how can you expect to co-operate successfully with strangers?? My Christmas gift would be the power to realize that we shall not gain our full rights until we trust each other, rise above petty ill feelings and join hands in fair brotherhood.

"*Go put your creed into your deed*" says Emerson, and also this:

"It is as impossible for a man to be cheated by any one but himself, as for a thing to be and not be at the same time."

COMFORT.—Another thing I would hang on your tree if I could is the desire and ability to make your home as comfortable as is possible. Some have the ability but fall down on desire. I think it is the God-given right of every child to have a happy care-free childhood. Denied that his life always lacks an essential. It is just as much a right for mother and the girls to have a comfortable and convenient home with facilities for doing their work. If I could put running water, hot and cold, into every farmhouse, I would wash away more of the trouble of farming than you and I can fight out in 10 years. Let me also put a good garden and lawn by every farmhouse, with roses and vines on the porch and trees about the house and I will increase the character and reputation of farming by 40 per cent. These are the things which we can all do in a small way or on a larger scale, and they will help us more than politics or discussing the war or the tariff at the store. These things all help to make a kindly and happier feeling at home and among neighbors, and this home and neighborly feeling is the foundation of all that we are trying to do as farmers to better our condition. Instead of buying some large present at Christmas why not put a little time each day in fixing the house and grounds so they will make life happier?

FINALLY, THOUGHT.—I would, if I could, put at the top of your tree, right under the star, the bulldog determination to think and reason out your hard problems. The man who gives you a rule and a sign charges you more than it is worth. There is no other farm or problem just like yours and no stranger can give you a complete rule. There are many who can help or suggest but, finally, you must apply the information yourself or live forever in a rut where the wheels of progress will run over. Hand a man a saw and a chisel and hammer and tell him how to make a door. He has the tools, but what sort of a door would he make until he studied it out and learned how? Give a man a general rule of farming and what can he do with it until he reasons it out for himself and applies it to his own conditions? I put this ability to reason and think at the top of the tree because the hand can be made free only through the mind. A man may read and study for years, yet his mind may be like a cellar full of potatoes. There would be a great collection of facts without any cohesive force or vital power. Far better half the reading well thought out and tested. For many years we have been letting lawyers, teachers, politicians and others do our thinking for us. When they gave us false reasoning we followed still because it was hard and unpopular work to reason for ourselves. The world could get on very well if there were a shortage of "high thinkers" for the next half century provided the great middle class of our people could come to think sanely and fearlessly over what there is already in the world. H. W. C.

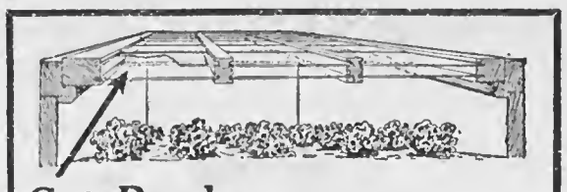
THIS WONDERFUL COLUMBIA PHONOGRAPH
On Ten Days' FREE Trial

The Columbia is the greatest of all funmakers, the king of entertainers, the most fascinating musical instrument the world has ever known. Listen to your favorite waltz, two-step. You have a vaudeville show, a grand opera, or the sacred hymn you like. Every kind of comic and popular music can be heard on this wonderful machine. We send you the machine, together with the selection of records on ten days' trial. You are under no obligation to buy, simply try the machine in your own home. If you find it the most wonderful entertainer you ever saw or knew about, and desire to keep it, you can pay for it all cash or on very easy terms. Send your name and address for further information.

CONSOLIDATED TALKING MACHINE CO.,
50 Church St., New York City.

CANVAS COVERS
7x12, $4. PREPAID. WATERPROOF HAY CAPS. 43 inches square. 35 cents each; brass eyelets each corner. Everything in Canvas.
RYAN TENT CO., 313 W. Fayette St., Syracuse, N. Y.



Get Ready for your winter garden

Glass must be used whether you garden for profit or merely for the love of having flowers and vegetables when they are a luxury.

For the best results you must use the **Sunlight Double Glass Sash.** They make the earliest and healthiest plants at the least cost of money and labor. They are complete without mats or shutters. They are the standard sash of today among successful gardeners.

Immediate shipment can be made. Sash ordered today will reach you within a week and an order for our **complete little greenhouse** will reach you within 10 days. A handy man can set it up in a few hours.

Get our free catalog with all details, also Prof. Massey's booklet on hot-beds, cold frames and small greenhouses, for 4c in stamps.

SUNLIGHT DOUBLE GLASS SASH CO.

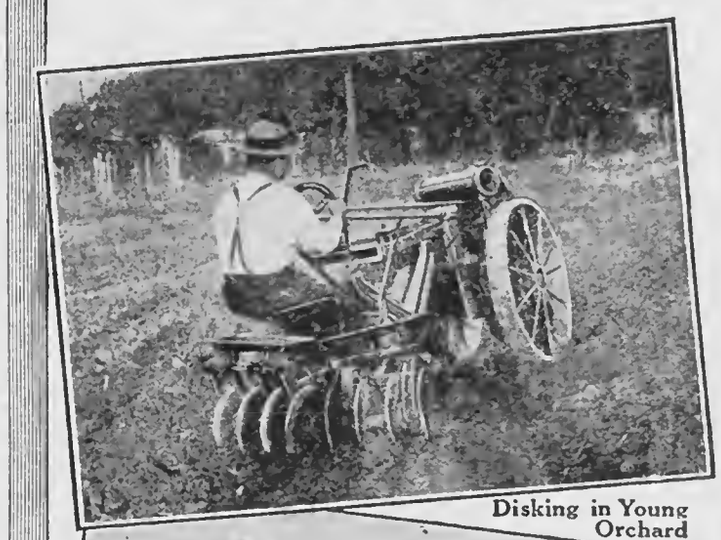
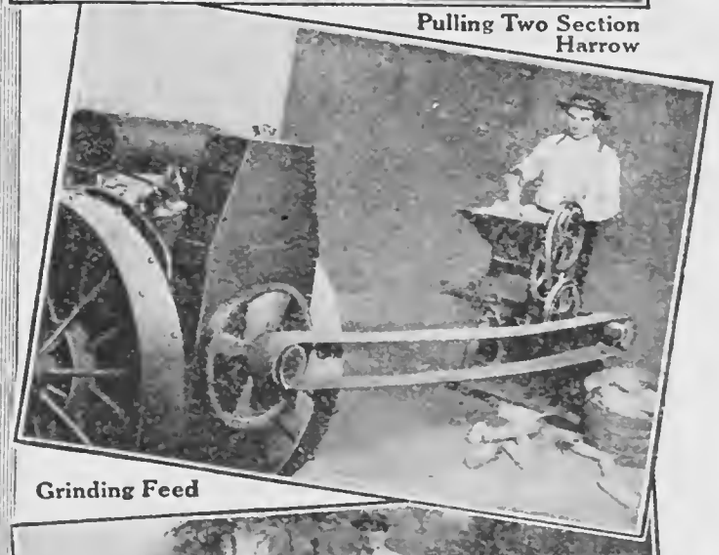
The Universal Motor Cultivator



Disking in Young Orchard

Cutting Alfalfa

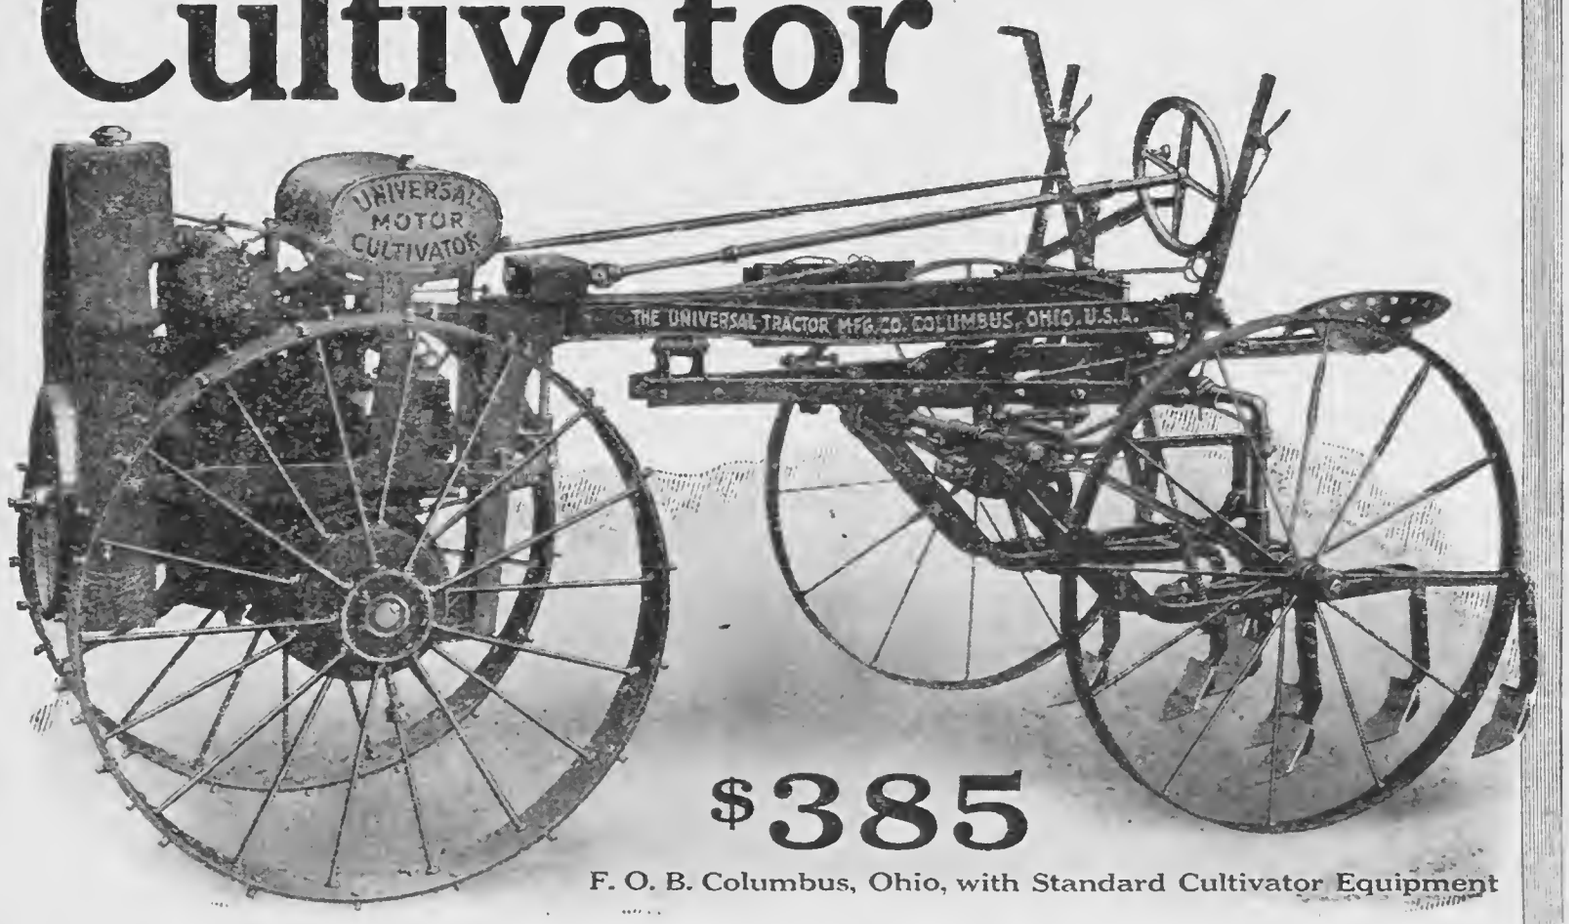
Pulling Two Section Harrow



Grinding Feed

With wide tires for rolling meadows when ground is soft and for working in sand and muck soil

Put on a headlight and cultivate at night when you want to drive the work



$385

F. O. B. Columbus, Ohio, with Standard Cultivator Equipment

Light, Simple, Powerful Tractor

For Field Work—a Power Plant for Your Stationary Jobs

Developed from the Automobile instead of the Heavy Traction Engine—A Boy Operates It Easily —Enables Farmer, Fruit Grower and Truck Gardener to Cultivate Constantly for Crop Insurance

Learn of Its Hundred Uses

The Universal Motor Cultivator makes a new record in its wide range of service. The need for it is as big as the agricultural world An all-round,economical,dependable farming servant every season.

It Cultivates corn, cotton, potatoes, kaffir, sorghum, sugar cane, federita, tobacco, tomatoes, garden truck, orchards, vineyards, etc.

It Pulls mower, rake, spike tooth harrow, drag, rollers, small disk harrow, cultivators of various kinds, weeders, etc.

It Plants corn, cotton, sorghum, clover, alfalfa, potatoes, garden truck.

It Operates pump, wood saw, feed grinder, corn sheller,washing machine, churn, electric light plant, or any other light appliance of the modern farm.

Faster than Horses and Can Work Constantly

Rapid cultivation at the right time to save moisture and kill weeds is the aim of every farmer. The Universal makes it possible. Work 10 to 24 hours a day, changing men or boys, regardless of heat and at an average cost of but three-fifths gallon per acre.

When you *know* you can cultivate one acre an hour *any time* without dependence on horses, you can increase acreage and bank on greater yield per acre. Yet the Universal costs less than a good team, no more depreciation, no death risk, no time lost getting to or leaving field, expense stops when work stops. No experienced help needed. The Universal is semiautomatic in operation. Automatic governor takes care of the varying power needed. Lubrication by plunger pump, operator free to steer and watch the cultivator.

Big Margin of Strength Everywhere

Toughest heat treated drop forgings of alloy steel. Steel and malleable iron castiugs. All crank and cam shaft bearings made of special bearing bronze. All working parts enclosed in oil-tight housings. All parts machined to the finest limits.

The "V" type, two cylinder, water cooled motor has 3½ inch bore and 5 inch stroke, automatic plunger pump lubrication, thermosiphon radiator, Holley Carburetor, Atwater-Kent Ignition, automatic governor, controlled from the seat while machine is in motion, worm drive running in oil bath, expanding ring clutch, one speed forward and reverse, gear ratio 55 to 1, weight 1,000 lbs., speed 1 to 4 miles per hour, motor developing 10 h. p. on break test, *pulling horse power* equal to *team medium size horses*. Prepare for cultivating season by investigating at once.

Get This BOOK

It goes thoroughly into the construction of this wonderful machine, answers all the questions that will arise in your mind, tells the complete story. At best this advertisement can only make the announcement. Now you must do your share. Drop a letter or a post card for the book. Ask any questions that come into your mind. Give us a chance to tell the whole story plainly and carefully.

THE BUSINESS FARMER'S PAPER

A National Weekly Journal for Country and Suburban Homes

Established 1850

Published weekly by the Rural Publishing Company, 333 West 30th Street, New York
HERBERT W. COLLINGWOOD, President and Editor.
JOHN J. DILLON, Treasurer and General Manager.
WM. F. DILLON, Secretary. MRS. E. T. ROYLE, Associate Editor.

SUBSCRIPTION: ONE DOLLAR A YEAR

To foreign countries in the Universal Postal Union, $2.04, equal to 8s. 6d., or 8½ marks, or 10½ francs. Remit in money order, express order, personal check or bank draft.

Entered at New York Post Office as Second Class Matter.

Advertising rates, 75 cents per agate line—7 words. References required for advertisers unknown to us; and cash must accompany transient orders.

"A SQUARE DEAL"

We believe that every advertisement in this paper is backed by a responsible person. We use every possible precaution and admit the advertising of reliable houses only. But to make doubly sure, we will make good any loss to paid subscribers sustained by trusting any deliberate swindler, irresponsible advertisers or misleading advertisements in our columns, and any such swindler will be publicly exposed. We are also often called upon to adjust differences or mistakes between our subscribers and honest, responsible houses, whether advertisers or not. We willingly use our good offices to this end, but such cases should not be confused with dishonest transactions. We protect subscribers against rogues, but we will not be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent to us within one month of the time of the transaction, and to identify it, you should mention THE RURAL NEW-YORKER when writing the advertiser.

THEY all were looking for a King
To slay their foes and lift them high;
Thou cam'st, a little baby thing
That made a woman cry.

O Son of Man, to right my lot
Naught but Thy presence can avail;
Yet on the road Thy wheels are not,
Nor on the sea Thy sail.

My how or when Thou wilt not heed,
But come down Thy own secret stair,
That Thou may'st answer all my need—
Yea, every bygone prayer.

—George Macdonald.

THE question of successful free markets in New York City has come down to a contest between the retail storekeepers and the consumers. The butchers and the grocers sell farm produce at high prices. They pay high rents and there are too many of them anyway. The entire system of retailing is extravagant and wasteful, yet the retailers fight to keep it up. The free markets, even as a crude experiment, have already shown that the public may buy their food to far better advantage by cutting out several middlemen. The butchers and grocers plainly see that if this new system is permitted to develop the outcome is sure. The public, once clearly shown that with one useless middleman out of the way, their food becomes cheaper, will demand a revision of the whole system of distribution. This will mean direct trade with only the *necessary* handlers between the consumer and the producer, and both classes benefited. In all this discussion no one who looks at the subject fairly wishes to injure the *needed* handlers of produce. The great effort is to cut out the parasites who fatten upon the share which rightfully belongs to the producer. The New York retailers are trying to kill off the free markets, while the organizations of buyers and labor are fighting for them. Out of the conflict will come education in buying, which is the thing to make direct dealing possible.

THESE articles on Alfalfa growing in Central New York mean far more than you may think at first glance. Wherever Alfalfa thrives prosperity follows. No other plant has so fattened the soil and made so much of history as Alfalfa. The Argentine Republic, in South America, has put itself upon the map almost like a miracle, and Alfalfa is probably more responsible for this wonderful growth than any other single thing. The American desert has been made rich and habitable by Alfalfa and water. It is the surest thing known that any section which systematically encourages the production of Alfalfa on soil well adapted to it has a sure mortgage upon the future. That is one reason why the Alfalfa section through Central New York is to become the great garden spot of the upper Atlantic slope. Its cities and its farms will feel the effect of the great wealth which, year by year, this wonderful plant is bringing to the soil. We believe this thoroughly, yet we do not join those who urge farmers everywhere to grow Alfalfa. We believe there are some, yes, many, sections in New York where the crop will not pay. There are thin, sour lands too far from limekilns or wet, undrained tracts not suited to this remarkable crop. At present the cost of fitting such soils for Alfalfa will prohibit its use, and Soy beans, Alsike clover and vetch will, we believe, pay better. Some useful legume plant may be found adapted to any soil in the State, and its use may in time prepare the soil for the king of them all —Alfalfa!

THE time has come for some one to prepare a thoroughly complete and comprehensive history of American agriculture. What a story that will present to the skilled historian! From the rude beginning at growing corn and beans on abandoned Indian commons to our present marvellous system of crop production! Into that growth is woven the life of a mighty nation: for after all the story of a nation's bread is the vital thing in its history. We hope some one well equipped for the work will take up this history and make it complete.

CHRISTMAS is essentially a children's holiday—founded upon the birth of a little Child, and built out of the pure faith and trusting love of children. We older people perhaps do not realize it but Christmas becomes a happy and helpful holiday in proportion as we go back into childhood, and all that childhood means. Some of us have come to the time when we must live most of our years in memories. We may confine ourselves to our own sad thoughts, or we may live with the world's memories which great writers have preserved in books for us. The future belongs to the child and we who are older can view it hopefully and sweetly only as we can take from children the true, unspoiled view of life. That is why the little child is after all the best and most valuable asset a country can have. That is why a man's children should mean far more to him than all his worldly possessions. This true, unpurchased love and faith of the little child is the greatest thing in the world. The glory of Christmas comes from the fact that at this season we come nearer to realizing it than any other time. And what is this thing about the child which lifts us all at Christmas into a higher and clearer view of happiness? A hopeful trust in others, a confident, unafraid certainty that some wise, higher, loving power will protect and provide! It is after we grow away from care-free childhood that we begin to feel that fraud, fighting, and all the mean and hateful qualities are needed for the struggle of life. Do we not know that men have fought and distrusted and stood apart for all these years, only to find that the plain common people are no match for the strong at such tactics? This Christmas, with its sadness of war, and its curiosity for the future, ought to teach us all the futility of battle and bluff. Can you not see that after all the child's faith is stronger than father's fight? As farmers and as men in the mighty peaceful struggle which is now coming for industrial rights, we must realize this Christmas Day that before we can hope to win we must set the nation an example of true co-operation and honest brotherhood.

IT looks as if the good old apple were to have a fine Christmas present this year. Several persons have written about a report that diluted cider vinegar has been found to be a fine mouth wash and preservative for the teeth. In order to be sure of the matter we consulted one of the most expert dentists in New York. He says that a professor at Columbia College has been working for some years in an effort to learn the cause of tooth decay and a simple means of prevention:

He has found that fruit acids dissolve mucine, and mucine deposited on the teeth forms mucilaginous films, which films hold or envelop the acid product of the bacteria in direct contact with enamel on sheltered portion of the teeth, thus permitting the full chemical action of the acid to go on undisturbed. Now the question we are trying to prove is, if dilute fruit acids, such as cider vinegar, say one part to four of water, will dissolve the envelopes without injury to the tooth substance, and will thus prevent decay of the teeth.

There is nothing sure about it yet, but the outlook is very hopeful. Some excellent results have been obtained but it is not regarded as a full demonstration yet. Should this plan of saving the teeth succeed, as we hope it will, our old friend the apple comes into a new job—as toothbrush and tooth preserver. Instead of scrubbing your teeth with a brush all you have to do is to eat a mellow, raw apple! It cleans the teeth and its gentle acid plays havoc with the bacteria. This thing of using a fine Baldwin or Northern Spy as a toothbrush is the best yet. We must plant more trees to keep up with the market!

THAT article on dairying in New England suggests the way we must all work to relieve the situation in many of the large markets. So long as there is a surplus of milk sent to Boston and the other large cities the dealers and contractors have the advantage, and can dictate prices. Create a shortage in place of a surplus and the advantage shifts to the producers so long as they are organized. Therefore it is good management to use more and more of the milk in creameries for butter or ice cream, as all the milk thus used is kept away from the cities, and to that extent reduces the surplus. The same thing is true of the New York produce market. Vast quantities of food are sent here and then shipped out again, often for sale in a market not 10 miles from the farm, where the food was produced. This great surplus of food enables the dealers to dictate prices. It gives the railroads a double charge for carrying it, and the handlers have about three chances to take their share. One way to overcome this is to see that local markets in towns and cities throughout New York are supplied first of all with local grown produce. Elmira, Utica, Binghamton, and all the rest, are now using products which are grown on New York farms, sent to this city for sale and then sent back to the local market. All this adds to the surplus here, gives the dealers a better chance to dictate prices, and adds greatly to the cost of carrying and handling. Local co-operative clubs for selling and buying will help settle this. The way to relieve this big market is to take care of the local markets first.

HERE is a Christmas present which would be highly appreciated by the farmers north of Trenton, N. J. We want hardy strains of Crimson clover which we may use as manurial crops—seeded in the corn or after Summer crops and plowed under in Spring. The present strains of Crimson clover are doing wonders for the Southern soils, but they are too tender for Northern planting. With us Crimson fails to pass through our hard month of March, nine times in 10. While it more than pays for seed and labor in its Fall growth alone, our farmers want a clover that will live over and grow rapidly in Spring. A hardy Crimson would fill the bill exactly and would save thousands of dollars now spent for plant food. The wise men have found hardy varieties of Alfalfa to suit the North. Now let them play the part of scientific Santa Claus and give us a hardy Crimson clover.

NO one can lay down rules or systems for farming. Each man must work that out for himself, using all the information and experience available and as the farmer's knowledge and ability to think grows so will his management grow and change. E. M. M.

If we could give each of our readers a valuable Christmas present we would select the power to make each and every one of them appreciate and understand the truth of that statement. Sometimes we have people come and ask for a sure rule or "sign." "Do not tell me to figure it out myself," they say. "I want you to do it for me and tell me just exactly what to do." We think more children at school are spoiled and mentally crippled by making their studies easy than in any other way. The little things are not taught to think and reason for themselves, and thus they go through life handcuffed by a cast-iron rule to the habit of depending upon others for original thought. No farmer can succeed by following "signs" or by doing just what others tell him to do. The best teacher gives him the truth of general principles and stimulates him to go on and think out his own problem. Many are called—few are chosen—those few are the thinkers who break free from the slavery of the rule and the "sign."

BREVITIES.

WOOD ashes for sour land.

CULL apples make a good "green food" for poultry.

LET'S organize a society of people who agree never to jump at conclusions.

MAY Santa Claus your presents stack and in your stocking put no tack.

IT surely is a period of life to be called shocking when children get so wise they take no stock in Christmas stocking.

A GREAT world we live in—supplying bullets with which to make orphans and then providing bread for the orphans our bullets have made.

WISCONSIN has a law under which a farmer may have the soil of his farm fully tested for $5. Over 200 farmers applied for this test last year.

"THE hot-air artist from Madison County." Our correspondent on page 1452 wants to hear from this character. There are 16 Madison counties in the country, and no doubt they can all produce "artists" in the heated atmosphere line.

IN a recent issue a reader asked if the old slat and wire fence had proved durable. At least a dozen people have come trying to sell him a fence machine. That is not what he wants—he wants to know if this fence will equal woven wire.

THE neighborhood terror! He or she who purposely spreads abroad the error. Lord knows that all of us stumble on the way, all of us make mistakes. All of us get gay. What's the use of writing down all the little slips? Better far forget them—better close the lips.

WOMAN AND HOME

"Grandpa's Christmas Story"

(As reported by Jimmy)

By Harry Ayres

"HOW-DO, Mis' Holcomb. Maw said I could come over an' play with Harold 'til four o'clock, if you was willin'."

"All right, Harold. Go get your skates, your Maw sez you can."

"*Ain't* they dandies, though. Paw sez Maw got in ahead of him an' told Santy to bring me this dandy mackinaw coat, so he didn't know what to reccermend 'til he happened to notice a nice, smooth piece o' ice below the bridge when he was on the way to the Junction with a load o' calves, so he stepped in an' told Santy he knowed a boy at the third farm beyond the school-house on the West Road 'at would 'preciate a nice pair o' skates."

"Not a bit o' danger, Mis' Holcomb. Paw told Maw if we broke through there ain't enough water in the creek this year to break up a settin' hen."

"Yessum, I allers have a nice Christmas when we go to Aunt Lizzzie's—it was our turn to go out there, this year. She's jist as good cook as Maw is, an' she ain't all the time frettin' for fear you'll eat too much, the way Maw is. Paw sez the on'y way he c'n tell them two women apart is that one is short an' stout an' the other ain't."

"Oh, *him*.—he's allers crackin' jokes. Me an' him an' Maw an' Henry an' Emily went with the team an' Sheldon an' Edith went in his brand-new cutter—say, that mare o' his c'n go like greased lightnin'!"

"Maw told Henry to look at the weather-report when he took the milk to the station an' it said, 'Probably rain. Warmer.' Paw said that meant fair, an' cold enough to freeze the hair off'n the lap-robes. She wanted to take umbrullas an' he said, 'Shucks! Better put in a couple o' extry robes.' She said she knowed we'd get soaked afore we got back, an' he said she was a pessimist o' the purest water. Henry said we might put the unbrellas under the back seat an' sit on the extry robes, so's to be ready for whatever might turn up. Paw sez, 'Henry, if you'd bin in Taft's place you'd a-bin re-elected, you're the greatest harmonizer since William McKinley.'"

"Sure, ma'am, he was the 24th President of the United States—I learnt that in my jography lesson."

"Sheldon an' Edith didn't start 'till a hour after we did, but we hadn't got to the Emerson place 'fore we heard his bells jinglin' behind us. Paw wouldn't turn out for him—jist for fun—so they went round by Gaines's cheese factory an' when we was most to the Payne place there they was cuttin' in ahead of us. 'Whip 'em up, Ezry,' sez Maw, but Paw sez, 'Not me, Mary Ann, I don't relish takin' a hold o' the red-hot end of a poker. That mare could beat 'em that distance on three legs. 'Sides that, I aim to handle this team so's they'll last me 'til I quit farmin' an' take to settin' around tellin' other folks how to do it.' My! How they did laugh at us, though."

"When we got there Uncle Jim took the team an' we all went inside. There was Aunt Sophy, so we knowed Granper an' Grammer was there. They was awful glad to see us—'specially me. Aunt Sophy pertended she didn't know me—I'd growed so. Aunt Lizzie hugged an' kissed me an' cried, like she allers does, 'cause I'm about the same age as her Willie what died."

"Yessum, an' her little girl died too. Maw sez her heart aches for Jim an' Lizzie, they've so lonesome. Uncle Jim allers goes off if anybody mentions 'em an' Aunt Lizzie cries."

"Well, whilst the women-folks was puttin' their things away an' all talkin' to once we men-folks went into the parlor, where Granper an' Grammer was warmin' up after their cold ride. 'Course, they made a lot o' fuss over me, too, an' I was awful glad to see 'em. Pretty soon the rest come in an' I went to the kitchen to see what the prospects was. Gee! They was *everything*. I guess mebbe I couldn't a helped just *tastin'*, but Uncle Jim come in the back way an' when he see me he ask me didn't I want to go out to the barn an' see the critters. Say! He's got the funniest barn you ever see! 'Stead o' puttin' in his hay with a hoss-fork, the way Paw an' Mr. Holcomb does, he drives clear up to the top o' the barn an' dumps it off into the mow. Then he keeps his horses an' cows in the same stable an' the henhouse opens into it, so's the heat from the cows c'n go in. Sez his hens waller in two feet o' dust an' he ain't never seen a chicken-louse in his stable yet. He ain't got no silo, neither. He grows mangels an' turnips an' cuts 'em up in a root-cutter down in a cellar under the stable an' h'ists 'em up in a elevator he made hisself. Sez he c'n make milk cheaper on roots an' fodder an' hay 'n Paw can on silage an' hay an' boughten grain. Paw sez mebbe he can, but *he's* f'm Missouri. Henry sez its a case of every shoemaker to his own last, but I don't see what shoemakers has got to do with farmin'."

"I was glad I went to the barn, 'cause dinner was ready when we went in an' I didn't have to set around an' wait. Soon's we was all set, Granper rose up an' sez, 'Children, let us remember Whose birthday this is. Then he ast the blessin'. We all bowed our heads but Uncle Jim."

"I d'know, ma'am, but I guess it's 'cause he's a infidel."

"No, I d'know what a infidel is, but I bet it's sump'n awful, 'cause Aunt Lizzie allers cries if anybody sez anything about it."

"Well, when Granper got through, Paw sez, 'AMEN.' Uncle Jim looked at him kind o' susprised an' sez, 'What! Is Saul also among the prophets?'"

"'Ever since Thanksgiving,' Paw sez."

"'Kind o' sudden, ain't it?' sez Uncle Jim."

"Granper spoke up—'Mother and I have received many warm tokens of regard from our children today, and we appreciate every one, but the best Christmas gift we have received is that declaration of Ezra's. Jim, you have been a good hnsband to Lizzie and a good son to us. But it grieves us to see how hard you take your trouble. Mother and I have talked it over a good deal, lately, and after we have enjoyed the bountiful and delicious meal before us we will all go into the parlor and I will tell you a true story.'"

THE ENTIRE FAMILY READY FOR SANTA CLAUS.

"Yessum, Granper allers talks like that. When we was comin' home Emily sez: 'What beautiful English Grandpa Martin uses! He would make a fine public speaker.'"

"'Law, child,' Maw sez, 'didn't you know? Granper served three terms in the Legislature.' An' Paw sez, 'Yes, an' the voters o' this district bought a goldbrick when they turned him down for that lawyer from Blankenburg. They got their bridge an' the Blankenburg people got their armory, but the only good the bridge does 'em is to add to the beauty o' the scenery an' I guess the Blankenburg people think they got a white elephant on their hands by this time.'"

"Yessum, I can tell it to you most *exactly* like Granper said it, 'cause I got a good memory—Paw sez so."

"Well, when we went in, Grammer took me up in her lap an' Granper took her hand. All the time he was talkin' he kep' a strokin' an' pattin' it."

"'Children,' he sez. 'When I was a young man my lines fell to me in pleasant places. I didn't have to work hard to pay for my farm as you boys have—better for me, perhaps if I had. It was much larger then than now. Everything I undertook prospered. I said in my heart I shall never be moved. I was blessed with a beautiful and loving wife, a son and heir to carry on the name and position of the Martins and a daughter who gave promise of great beauty. I had reason to be proud, but my pride was the kind that goes before destruction. The Age of Reason was my Bible and Voltaire was my prayer-book. Though the lives of my father and mother and my wife compelled my respect, yet I deemed in my conceit that they were deluded by old-fashioned notions that were doomed to disappear before the light of Reason."

"'At the height of my prosperity I sent in my application to the local lodge—there was only one kind of lodge in those days. I have no doubt it would have been accepted, but, as soon as he heard of it, my father came to see me. He asked me if I knew that no honest man could be a member of that fraternity and an infidel at the same time. I asked him why and he told me. He said that though nothing on earth could give him as much pleasure as to know that I had come back to the belief of my fathers he would rather see his son an infidel than a hypocrite. He would not argue with me—perhaps I might have bested him at that—all he would say was, 'I would rather see my son an infidel than a hypocrite.' That set me to thinking as nothing else could have done."

"'Possibly this might have worn off in time, but, shortly after, our children caught the diphtheria. It had raged all around us, but we had taken every precaution known in those days, and how they contracted it I cannot conceive. Anti-toxins and methods unknown then have since robbed the disease of much of its terror, but then it was a terrible scourge, and the neighborhood was in a panic. Our help left us. Our only way of obtaining supplies was to have some of the bolder neighbors bring them to where the free-delivery box now stands and leave them for me to take after they had withdrawn to a distance, when they would ask after the children and I would tell them what we needed further.

"'At the height of our extremity a preacher, who had a few years before come to our hills from the city for his health, and whom, in the days of my prosperity I had laughed at, came to us to help care for our little ones. To my protests that he owed it to his wife and two little girls to avoid us as the rest did he replied that his wife had sent him and he could trust his little ones to God and her. Mother here can tell you how gentle as a woman he was and did all that possibly could be done. But they died. Then it was I discovered that I had no ground to stand upon. Mother had, and but for her I think I should have gone crazy.

"'Then came the war. I wanted to go, but hated to leave Mother after what she had been through. It was not a conflict between love and duty, but between my duty to my country and my duty to my wife. One day I came across the preacher. As a mere formality I asked him where he was bound for, and he re-

(*Concluded on page 1477.*)

A Prayer.

Lord, not for light in darkness do we pray,
Not that the veil be lifted from our eyes,
Nor that the slow ascension of our day
Be otherwise.

Not for a clearer vision of the things
Whereof the fashioning shall make us great,
Not for remission of the peril and stings
Of time and fate.

Not for a fuller knowledge of the end
Whereto we travel, bruised yet unafraid,
Nor that the little healing that we lend
Shall be repaid.

Not these, O Lord. We would not break the bars
Thy wisdom sets about us; we shall climb
Unfettered to the secrets of the stars
In Thy good time.

We do not crave the high perception swift
When to refrain were well, and when fulfill,
Nor yet the understanding strong to sift
The good from ill.

Not these, O Lord. For these Thou hast revealed.
We know the golden season when to reap
The heavy-fruited treasure of the field,
The hour to sleep.

Not these. We know the hemlock from the rose,
The pure from stained, the noble from the base,
The tranquil holy light of truth that glows
On Pity's face.

We know the paths wherein our feet should press,
Across our hearts are written Thy decrees,
Yet now, O Lord, be merciful to bless
With more than these.

Grant us the will to fashion as we feel,
Grant us the strength to labor as we know,
Grant us the purpose, ribbed and edged with steel,
To strike the blow.

Knowledge we ask not—knowledge Thou has lent,
But, Lord, the will—there lies our bitter need,
Give us to build the deep intent
The deed, the deed.

—John Drinkwater, in London Spectator.

*

A Farmer's Wife on Dogs.

WE were awakened this morning at 4 o'clock by the usual farm chorus: Hens singing, roosters crowing, turkeys "gobbling," robins and orioles "making melody in their hearts," and in the morning. Lambs, too, were bleating, and we noticed the nagging bark of a dog. Investigation showed the sheep and lambs huddled in a tired, terrified bunch on the side of the meadow nearest the house, and two curs harrowing them. A bulldog had a lamb by the throat; one other lamb and a fine ewe so heavily burdened with motherhood that she could run no longer, had been sacrificed. I could have shed bitter tears of sorrow and indignation at the outrage. Of course, we shot at the dogs and did what we could to locate them. There will be a process of "recovering damage," so-called, but looking at the matter in a wider sense there is no reparation. We have made a practice of saving the best ewe lambs with a view to "building up the flock," but what is the use when every farmer's flock is prey to any and every yellow cur in the neighborhood? Every other farm paper we get has an article exploiting "sheep husbandry for the Eastern farmer," and again what's the use? "Farm credits," "farm bureaus," and a lot of other big things are good and desirable no doubt, and will tend to the advancement of agricultural interests, but when will legislative "powers that be" stop studying the moon for a few minutes and attend to the jobs that need doing right under their noses, so to speak? For the sake of the families that keep the dogs and the farmers that would like to keep sheep we want a tax on dogs so high that 90 per cent. of them all through the country will be dispensed with, and the rest counted valuable enough to be cared for and restrained, like a horse or other valuable live stock.

Poor, hard-working people cannot afford to board dogs, so they allow them to go half starved. The great middle class of people can get along without them, and should be obliged to until they can afford to pay for them at the rate they would for a motor boat or automobile. So far as the wealthy men are concerned who want their hunting dogs, and my lady that wants her poodle, let them, too, "pay the fiddler," as they do when they want fancy guns, diamond pendants or other luxuries. A FARMER'S WIFE.

RECENTLY a woman asked advice about buying a small farm. She asked in good faith, and really wants to locate in the country, though she did not wish personal correspondence. There have been already over 20 letters for her. Three men express a more or less well-formed desire to marry her. A dozen people want to sell her a farm—two or three say they can invest her little sum of money to advantage. Such personal problems always bring out a flood of questions. Our plan is to send such letters direct to the party most interested, leaving her to reply as she sees fit. We do not give the address without consent. Some of the writers complain because we will not give this personal address, but a little thought will show them why the party who is most interested should have the right to decide the correspondence. In one case a business man wanted a farmer. Over 50 persons responded. It would have been impossible for this busy man to reply fully to all, yet some of these writers were grieved because we would not give this man's address without his consent.

*

ONE of our readers, a woman in a Pennsylvania town, is greatly troubled because a whiskey company in Kentucky persists in sending her advertising literature soliciting trade. These circulars also come in large number to other people in the same community. This woman, a strong temperance advocate, is greatly annoyed by these circulars, but although she has written the company to stop sending them, they still come. She has written us to know if it is not against the law to mail these whiskey advertisements. She reads in the papers what the government is doing in shutting off fakes and frauds who offer patent medicines or other fraudulent goods. As she believes that whiskey is worse than any of these, she thinks the mails ought to shut out such matter. On referring this to Washington, we received the following brief communication:

> You are informed that there is no law authorizing the exclusion from the mails of whiskey advertisements, as such.
> W. H. LAMAR, Solicitor.

The law, as we understand it, at present permits the mailing of these whiskey advertisements. Under the law the mails can be denied to people who undertake to distribute or advertise a fraud, that is, something which deceives the buyer. Many of us consider whiskey as the crowning fraud of all, but under our present laws, mails continue to carry the advertisements.

*

IF the dollar was all I got out of my farm I'd quit it to-morrow. The joy of winning is the satisfaction of life. Don't concentrate all your energies in making money. Make your lives broader, have something besides work to think of. I've taken more pleasure in producing new varieties of fruit, even though they were commercially valueless, than in all the fruit I've grown for market.

This is taken from a talk by Herbert O. Mead before a Grange meeting in Massachusetts. Mr. Mead is a very successful fruit grower, and he talks gospel truth in the above. There is no finer thought that can come before us at Christmas. Many of us are hard pressed for money, and the future may seem dark at times, but have you ever thought that the only way to rise above and out of the depression is to take some higher ground in thought, and try to make your farm produce something which money with all its power cannot buy?

*

"SUNNY MONDAY" is the latest name for washing day—where you have all the fixtures and power. It is a wonder our enthusiastic friend who tells us of his wonderful electrical kitchen helpers does not mention some device for cleaning the dirt out of clothes by "lightening." We have no doubt that will come in time. In the meantime can you not manage some way to dodge the wash board? The big colored woman who helps with the rougher washing, will not use the machine. She prefers to "scrub 'em out," yet there is nearly always a "misery in de back!"

*

THE question of the relation between the owner and the farm manager is bringing some skeletons out of the closet. Several "managers," who seem to have

"GOOD LITERATURE" LEADS TO A LOSS OF CREAM!

failed, say the worst trouble was caused by the women folks who interfered with suggestions or commands that were not practical. Some of them say the owner or farmer was bossed by his wife and daughters, and the manager could not take orders from a woman. What do the women have to say to that? They are interested parties, and their opinions are worth while.

*

IT is more than remarkable how certain "feminists" are laying down the law to their sisters. The latest is the demand that matrimony and housekeeping be considered a profession. Here is one statement of the case:

> Especially, it seems to me, young women contemplating matrimony should be made to realize that they are choosing a profession, just as they might choose medicine, law, business and so forth. So firmly do I believe this that if it were feasible I should like to see a preparatory course required before granting the certificate to practice the profession of wife and mother, or some sort of an examination passed. It is required in professions far less vital to the welfare of the State.

What sort of an examination would this feminist suggest? Our mothers and grandmothers dignified the "profession" without knowing they had entered one. The modern young woman must have her feet on solid ground or she will be swept away by these floods of advice.

*

A WOMAN, Mrs. Annette Abbott Adams, has been appointed Assistant U. S. Attorney at San Francisco. As women have the ballot in California they ought to take public responsibilities. It is said that the District Attorney in appointing Mrs. Adams said: *"She is the only woman I have ever known who can think on her feet!"* The District Attorney seems to have had a very limited experience. We can easily find him hundreds of farm women who do clear and accurate thinking while walking through their household tasks!

*

"Shades of the Pilgrim Fathers!"

THAT is the opening of a news dispatch from Chicago. It states that roast ostrich took the place of turkey at many a Thanksgiving table:

> According to connoisseurs, the ostrich is a dainty morsel for the banquet board, there being many juicy cuts that are even sweeter than those of the gobbler. The first shipment of ostriches has arrived from a farm in Arizona, and others are to follow. Three restaurants have taken all of the first consignment at prices around 50 cents a pound. The most delicate ostrich will dress about 50 pounds, according to the commission men.

There is little use worrying about the Pilgrim Fathers or their shades. They were practical men, and had they landed in Africa instead of at Plymouth, they would have been thankful for ostrich and made it the "national bird." It is said that the ostrich can digest shingle nails or door knobs. On the homeopathic principle therefore it ought to make "good digestion wait on appetite."

*

A Bread-sponge Sermon.

THE minister's cheery-faced wife found a sermon in her bread-sponge, and she told it to a neighbor, something after this fashion:

"My bread-sponge has risen beautifully, and as I worked it down I thought how much I treated it as God sometimes treats us. I set it in a nice warm place, covering it well and it rose, just as I expected it would. When I found it light and white I pressed it down. I could imagine it saying to me: 'Why! I thought you *wanted* me to rise. Why do you put me back where I was before?'

"Yes, I did want it to rise. It pleased me perfectly. Yet to the sponge, if it could think, it would seem as if I were displeased, and as if its efforts were wasted, or worse. Suppose, then, I assured it that it was doing right, and as I wished. It would, as soon as it was down, begin again to obey its good impulse to rise. Just as it reached its point of perfection, down I press it again. Now what would the sponge think?

"'Am I wrong this time? Was I wrong at first? Am I not wasting my labor? I have accomplished nothing by all my efforts, and apparently have displeased my maker.' But such a soliloquy would be all a mistake. I was pleased—much pleased—with my sponge. The efforts were not wasted, for each time that it rose it was better fitted to be made into light, sweet, nutty loaves. Moreover, if it had not been pressed down at the right time, its efforts would surely have been wasted, for too much continued success in rising would have spoiled it, and caused it to become useless to its maker."

It is more than 25 years since this sermon was preached in the parsonage dining room, and the preacher has long since gone to her rest, but the words have stayed in the memory of her neighbor, who now passes them on for the encouragement of any who may have been "pressed down." MRS. E. F. MILLER.
Vermont.

*

Don't Forget the Poor

IN our zeal for the poor of other lands we are apt to forget that there may be much poverty within our home neighborhoods; possibly even beneath the shadows of our home cities. Two years ago, after the purchase of a new market wagon, we decided to dedicate the wagon by hauling the first load to the poor. We have a list of our own of worthy poor, but in this case we offered to supply to worthy people selected by the King's Daughters' stipulating only that they should not take us to a home where we would find a lot of men playing cards or sleeping off a drunken spree. Of the 20 families we visited all seemed very worthy and surprisingly in need. I had not before believed it possible that so much poverty could be found in our fair city. This year we visited 34 families, a committee of the King's Daughters providing the list with the assistance of the pastors of the two largest churches of the city. We carried a load of apples, potatoes, pears and squash. All those visited were profuse in thanks, but some much more given to expression of it than others. May all who are blessed with a superabundance of any crop, far beyond any possible family needs, find it in their hearts to divide with the worthy poor that with which the Lord has blessed them so abundantly. I am slow to give to those who are poor because they have wasted their earnings for tobacco, strong drink or gambling dens, or to those who are too lazy to work, but there are enough of those who are poor from some other cause such as continued sickness, accidents, lock-outs and strikes. Let those who can aid them gladly. A FARMER.

Early Cucumbers Bring Pin-Money.

EARLY last Spring, when the days began to grow warm, I filled four half-barrels that were lying unused on the south side of the granary, with rich black soil, mixing in plenty of well-rotted manure and tilting them so they would get more of the sun's rays. In each I planted a dozen early cucumber seeds and spread a thin layer of sand over the top. Every day I watered them, and at night, while it was chilly I covered them with an old piece of carpet. The first week of May was cold and snowy, and I had to throw several forkfuls of straw on top of the carpet to protect them during the cold spell. They grew and thrived and by the middle of June I had large, luscious home grown cucumbers, which I had no trouble in disposing of at 10 cents each, and my only trouble was that my supply was not as great as the demand. My little experiment netted me $9.50, and I felt amply repaid for the small amount of extra work they had made me.

North Dakota. MRS. D. R. MERRY.

Home Canning.

FROM the little advertisement you inserted in "Subscribers' Exchange" we have sold to date $25.33 worth of canned goods, besides getting a number of good customers who will no doubt stay with us for years. This was one of the free advertisements you inserted for farm women. MRS. W. A. SMITH.

Our people will remember about this. We inserted the advertisement as an experiment, just to see if our people are buyers. The others all brought fair returns. We are surprised at times that farmers or their wives do not make a greater use of this department. Every issue of THE R. N.-Y. is read by at least 300,000 people—every one of them wanting something, and we doubt if there is any article of common use which could not find a purchaser if fairly presented to our readers. You must not expect the impossible through an advertisement and it may take time to attract attention and inspire confidence, but this "Subscribers' Exchange" really offers a great opportunity to many farmers and their wives to build up a good trade.

A Co-operative Kitchen.

NOT long ago we gave an account of the coöperative store which was organized at Montclair, N. J. This store seems to have given very good satisfaction, and now a new coöperative venture has been started in the same town. About one hundred men and women of Montclair have opened a coöperative kitchen. Their object is to have a place where a regular dinner can be cooked, and either served to the club members if they prefer, or sent out in neat packages to their homes. Recently a sample dinner was served to the shareholders of this kitchen, with the following bill-of-fare.

Julienne Soup
Maryland Chicken
Beans Sweet Potatoes Baked Potatoes
Mushroom Patties
Fruit Salad Cheese Balls
Meringue Coffee

This dinner was a sample of what they call a 50-cent meal. It will be a regular feature of the kitchen, and will be sent out to any of the shareholders at their homes.

Another plan of the kitchen is to serve these dinners in the homes of the shareholders, if they desire it. In such a case the kitchen will send competent people right into the private home to prepare and cook the food and serve it, the shareholders, of course, paying a fair price for all this.

Another feature which this kitchen intends to work out is a plan for training domestic servants. They will take women and girls and train them in cooking and serving a meal, and when they are efficient let them go out to do housework by the day, the week, or the month, as desired. This is a practical plan for solving the domestic help problem, which is a great trial and nuisance in all suburban towns. There is a chance for similar enterprises in almost any town of fair size, or even in country communities. Some businesslike women, or a group of women, can organize a kitchen of this sort, and as soon as they establish a fair reputation for producing good food, and handle it in a businesslike manner, they will have no trouble in obtaining trade. The whole tendency of the times is along the line of this coöperative work, and there is no reason why farm women should not have their share of it.

It is said that on Nov. 28 a party of eight persons took one of these sample dinners from Montclair, N. J. to Philadelphia in packages. The dinner came out of the containers warm and tasty and was a great success.

:: Business ::

Now It Is the Middle-Woman.

THE picture herewith shows a scene quite familiar to many farmers near the line between Rhode Island and Massachusetts. The woman who is driving this outfit has developed a fine trade in eggs and poultry, and light farm produce. She went into the country upon a farm when her husband's health gave out, and probably had the wisdom to see that as a back-to-the-lander she did not have the strength or the weight to pound a living out of the soil. There are different ways, however, of making a living, and this small and refined woman saw

A RHODE ISLAND MARKET WOMAN.

an opportunity to benefit both farmers and consumers by doing a produce business. We might, without disrespect, allude to her as a middlewoman, much desired and exceedingly useful in the community. She drives about through the country picking up poultry products and light high-grade material, and then takes it to Providence and other large cities, where she sells it out to good advantage. The farmers are all pleased to deal with her; she seems to be popular all along the way. Before she left town she was a stenographer, and her pounding the keys of her machine has evidently taught her how to touch the keys of human nature, so as to produce a good business document. This woman is doing well at her business, and she has certainly set us all an example of how to develop a good trade in a new way, and in a new section. There is more money to be made in the future by learning how to reach the consumer direct, than there ever will be in producing larger crops.

A Market for Shirt Waists.

DO you know any place where I could get sewing to do at home, for instance, shirtwaists or something like that? C. F.

Pennsylvania.

This question of earning money at home is one that is of vital importance to farm women and I hesitate to undertake to answer it without knowing the capabilities of the questioner and the condition which prompts the reason thus to earn money. Your own suggestion is a good one. Shirt waists in these times are used by every woman. In fact they are using more today than ever before, and a large number of them would be glad to find some reliable person who would make a waist that would fit and hold together after it was made. Your difficulty would be in finding a market. Are the conditions such that you feel as though you could go among your friends and acquaintances and ask for this type of work? If they are it would seem to me that you could begin there with profit to yourself and satisfaction to them. Gradually your customers would increase by one telling the other and you would probably get all that you could do. This method of securing work has two advantages. First, you know your people and you can be reasonably sure that the garments you make will fit. Second, a considerable portion of what you do could be delivered without incurring the small expense of the parcel post. I understand that the community in which you live is what we term a farming town. If you have friends living too far away to see personally you could solicit the work by letter. In doing that you would need to have them send you the following measurements: The neck, length of sleeve, length of cuff, around wrist, bust, waist and length of waist; also the style of waist desired. I am quite sure as I said at the outset that you will find enough women who want shirt waists to furnish all the work you could do. It will require a little effort to secure customers, but once you have established a trade, if you charge only a reasonable price, they will come back again and again, as they go to a store to buy, and you are likely to find that will bring their friends with them. To build up a trade of this kind is possible, but it will require a little effort on your part to let the people who want your work know that you can and will do it. ESTHER A. COSSE.

A City Ice Box.

IN a recent issue we had a brief account of the public refrigerator in the city of Cleveland, Ohio. There has been some further correspondence about this, and so we print the following from the market master of Cleveland. Women in Cleveland might club together, buy good-sized lots of supplies direct from farmers, and store in this refrigerator until wanted.

There are a great number of people in Cleveland who have stored a crate of eggs or a barrel of apples, and we allow these patrons to take out one-half of any package at the same rate charged ordinarily, but we do not allow them to take out a smaller quantity than this. You can see that it would be impossible to allow people to take out one dozen eggs, or a peck of apples out of a barrel, as it would be too costly to operate under this plan. In most cases, two or three families take advantage of our plan and in this way they can consume one-half of a package to advantage. The rate for eggs is 40 cents per crate per season, meaning from April to February 1st, or 10 cents per month. Apples are 40 cents per barrel for the season, from Oct. 1st to May 1st, or 10 cents per month. We have approximately 300 of these patrons at the present time. CHAS. KAMP.
Market Master.

Trade by Parcel Post.

REFERRING to article on page 1390, under the caption, "Be fair in parcel post prices," I inclose a leaflet published gratis by the postmaster at Washington, D. C. This gives the addresses of the farmers and the prices which they ask for their wares for the next two weeks, otherwise the circular is self-explanatory and needs little comment from me except to say there is range enough in prices with fresh eggs quoted at from 25 to 60 cents per dozen. I am much afraid some of those 25-cent eggs are sold at less than cost. I know eggs produced on our farms just now cost at least $1 per dozen to produce, and I think we produce them as cheaply as anyone can at this time of the year who has to buy grain. I should be very glad to see this Washington experiment duplicated at New York, as I believe it would quickly solve the question of bringing the farmer and consumer together with mutual advantages. F. M. P.

New Jersey.

R. N-Y.—This list will be furnished by the postmaster at Washington, D. C. It contains the names and addresses of 147 people who offer produce for sale by parcel post. This produce includes eggs, poultry, butter, fruit, nuts, vegetables, hams and sausage, flour and cornmeal, pine pillows, pickles, beans, cider, roots and herbs, flowers, oysters and fish, etc. Most of these people are doing a fair trade, the increase depending on the care they take to please customers by packing and grading. Send for this list and study it.

Cat Breeders.

ARE there dealers and breeders in Angora cats and where could I find such. Is there any sale for these cats? I have been told they sell at $15 each when very young. M. E. S.

There are a good many cat breeders—some of them say they do fairly well when the breeding business is a side issue. Very few of them we think, depend on their cats for a living. There is a fair demand for these cats as there is for show or toy dogs. The best way to learn about this business would be to attend the cat and dog shows frequently held in the large cities, and read the papers which represent this industry. No doubt there are women among our readers who handle both cats and dogs.

Home Markets.

I NOTE the remarks of the Hope Farm man on selling in the home market. We have depended on our local market for years. Our city has a population of 9,000, among which are many retired farmers. We advertise in the local papers and sell in direct competition with the Michigan and New York apples which are shipped in by the carload. These sell here at 50 to 75 cents per bushel retail. After allowing for the profit of the retailer, the wholesaler and the jobber, and paying freight how much profit did the grower in Michigan or New York get for his labor and investment? Let fruit growers in each State get together and organize associations for self protection against the organized buyers who refuse to pay decent prices. We also use a small advertisement which we enclose in letters as we have occasion to write on business matters. These lead to sales outside our State and we

ship to Indianapolis, Chicago, Philadelphia and other centers. Yesterday we shipped a lot to Southern Alabama.

JOHN L. SHAWVER.

R. N.-Y.—We print Mr. Shawver's card merely to show others how to do it. There can be no question whatever about the possibilities of the home market and the value of advertising. We must all learn how to do it.

IT is stated that over 50 per cent. of the students at the Kansas Agricultural College are self-supporting—wholly or in large part. These students do all sorts of work to help themselves along.

One of the most novel means of self-support has been adopted by a group of men, each of whom bought a cow. A Manhattan man interested in dairying is giving the students board and room in return for the milk from the animals.

This going through college tied to a cow's tail is an honorable way of getting through. We know of a boy who went through on the income from one sow. This sow's two litters a year gave money enough with what the boy earned to pay his bills. These bills, however, were light weights compared with what young people now consider necessary. We would like to know how many of these students are going through college partly on money which is taken from the needs and desires of sister and mother!

Taking Drudge Out of a Drudgery

Electricity and the Farm Women

ABOLISHING KEROSENE.—The man's part of the job of turning an old water-power cider-mill into an electric light, heat and power plant, ends with putting up the wires and starting the water wheel. This done, he had turned over a priceless servant to the housewife. When I look back over the two years our water wheel has been grinding out electricity instead of hard cider, I give thanks that the one thing it has accomplished above all others, is to lighten and make pleasant the arduous task of housework. It is a good thing for us men—lights the dark barnyard at night, does away with the dangerous dusky barn lantern, grinds our axes and scythes, turns the separator, and gives us bright, fresh, cool light by which to reach our newspapers and books evenings. But what it does for us men is nothing to what it does for the farm wives. In the first place, there are no lamps to clean and fill and tip over any more. When my wife goes upstairs at night, she doesn't stumble round in the dark feeling for a lamp to light. Before she enters that room, she touches a button on the wall in the hall, and the room is bright with light before she gets there. When she puts the supper things away in the cellar, the mere act of opening the cellar door automatically turns a switch that turns on lights in the cellar, lighting its farthest corner, something that never happened before. She doesn't strike a dangerous match to see the inside of a clothes closet. She carries a portable electric light in her hand, knowing that even if she wants to hang it on a hook against her best mull dress, the dress won't catch fire. Downstairs in the kitchen the lights hang from the ceiling, lighting the whole kitchen. She had a light on the wall right over the kitchen table; and it lets her see the inside of the oven. We have lights in all sorts of odd corners, to be turned on with the pressure of a finger—in odd corners which were unknown places at night, before we transformed our water wheel—places we couldn't see into, without a lamp or a candle in our hands. Electric light has literally made over the inside of our house, for the women folks.

IRONING BY WIRE.—Next to light, the best thing we have that is within the means of every farmer who owns a water wheel (or who has a neighbor who is willing to share one) is the electric iron. An electric iron costs from $2.50 to $4. It looks like another iron, except that it has a length of wire coming out from under the handle. This wire connects with any lamp socket, so my wife can use her iron any place in the house. Three minutes after attaching the wire to a lamp socket by the ironing board, the iron is hot, and it stays hot as long as the wire is attached. I don't know how many miles a woman walks, back and forth from the stove, on ironing day. And in addition to changing irons she has to tote wood and keep the stove hot. It is not the best job in the world, keeping the stove hot and blistering one's hands with an old-fashioned iron, on a hot Summer's day. With an electric iron, the housewife doesn't have to tramp, have to stoke, doesn't have any fire at all in the kitchen, to make her fret. If she wants a cup of tea, she turns the iron upside down and uses it for a stove. It boils water for tea, eggs, etc. Our neighbor used her iron in the bedroom last Fall, to heat milk for a sick child.

THE LIGHTNING STOVE.—When dinner time comes she "builds" the fire by turning a button. The oven is hot in 10 minutes; the griddles on top of the stove are hot instantly, for frying, boiling, toasting. This last Summer, our household did its preserving on the electric stove. There are three degrees of heat, to be had by turning a button. When the preserves begin to boil under the first heat, the stove is changed to the "third" heat, which keeps them simmermering slowly all day. You wouldn't know there is a fire in the room when the stove is going. It is a constant source of amazement to callers to see my wife open the oven of this cool stove one could sit on, without discomfort, and take out three or four loaves of beautifully browned bread, or a sponge cake baked with an evenness impossible with the uneven heat of wood or coal.

COST OF STOVE.—This stove costs money at first, I admit. New, it would cost about $85. But there the expense ends. As long as the water of our little river continues to run, and turn the water wheel, the man of the house doesn't have to stoke on a hot day; doesn't have to haul, buck and split firewood; doesn't have to stoke on a hot day; doesn't have to take care of ashes. The wife doesn't have to wait for her oven to get right, or fool with dampers. When she turns the button, she knows her oven *is* right, can't get too hot, or too cool. And what an advantage she has over her city sister, if she is fortunate enough to own a husband who owns an idle water wheel. Her city sister cannot afford this stove, because the commercial price of electricity in our cities is too high. The man I bought my stove from, at a knock-down price, gave it up because it cost his wife $2.50 to cook dinner for four on it, at the commercial price of electricity. It doesn't cost us anything. The river, flowing ceaselessly through the water wheel, tends to all that. If there is a river, or a sizable brook near your house, why not put it to work cooking your dinner, ironing your clothes, doing the washing, lighting the house? If one can't afford this more expensive stove, there are ways of getting around it. For instance, an oven that will bake two loaves of bread can be had for $10 or $12, and little portable stoves that boil and fry, like the top of a cook stove, can be had from $2 to $5. One of these little ovens, a hot griddle and a toaster, could be had for about $15 all told, and would be enough to take care of the cooking of a family of five or six.

THE ELECTRIC CHAFING DISH.—Electric cooking with us goes still farther. For supper, nights, we save more steps for the housewife. We have a little electric stove, nickel-plated, that we can set on the tablecloth, like a chafing dish. It has a cord to attach to the lamp socket that hangs over the table. This little stove costs from $4 to $6, according to the fanciness. It makes the most beautiful toast in the world; and while it is making toast, or frying eggs or griddle cakes on the table, it is broiling three chops at once, in a little grill underneath. This done, it boils water for tea: and later in the evening, when we are sitting in front of the log fire, we drop pop-corn on it, and watch the kernels magically puff up into beautifully white polls. My wife doesn't have to leave the table during the meal. With electricity, she has brought her kitchen into the dining room with her.

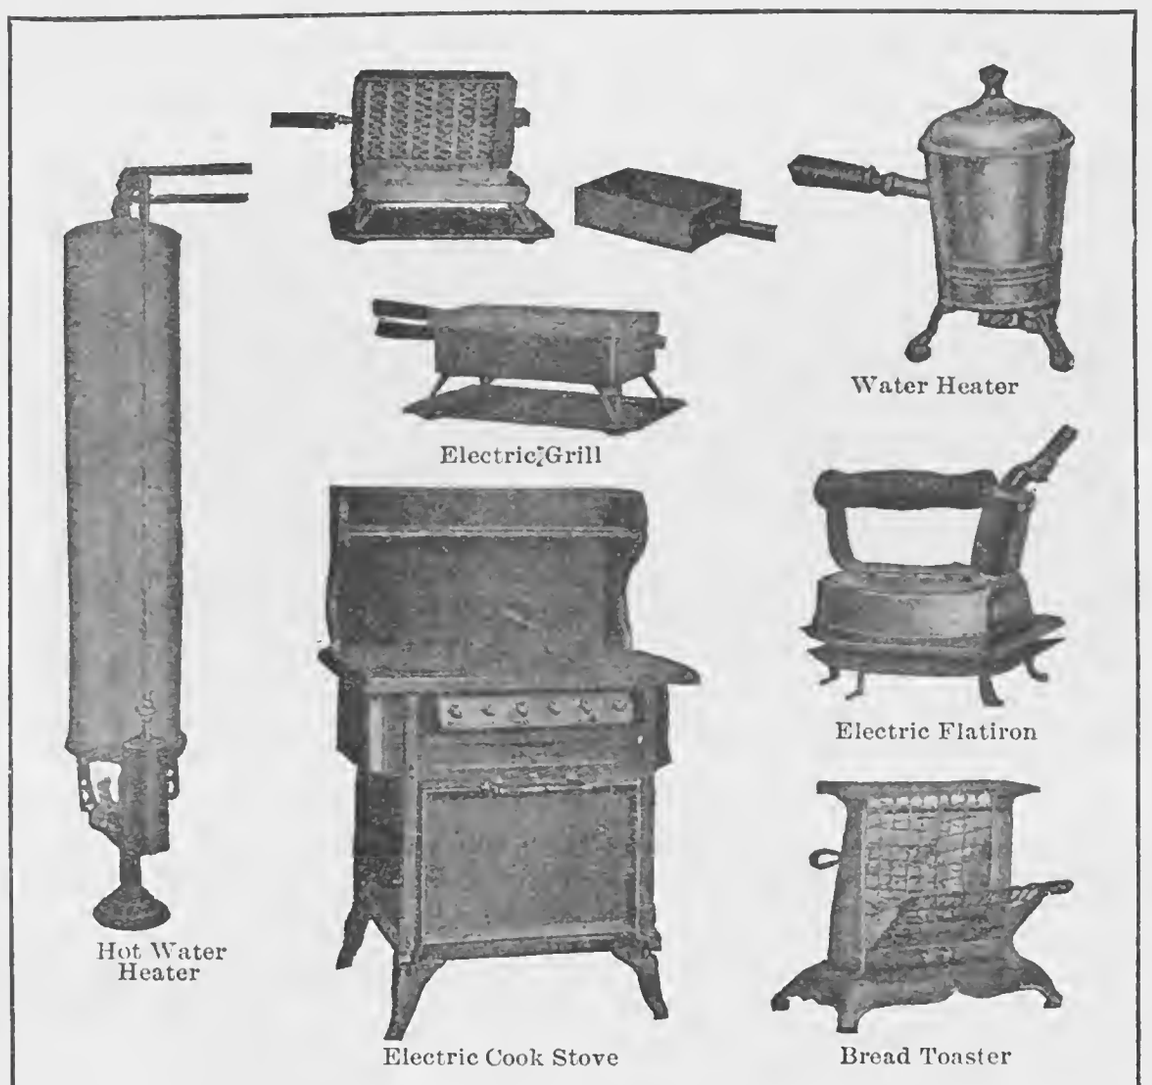
THE WATER HEATER.—The next thing I have promised our kitchen, is an electric water heater on the hot water boiler. It is about as big as a quart can and fits on to the feed pipe of the boiler. It costs about $10. It keeps the 40 gallons of water in the boiler at boiling point day and night, so when dish-washing time comes, steaming water gushes out of the faucets into the sink, heated by unseen hands.

MOTIVE POWER.—Then there is the motor that runs the cream separator. This motor does more than its share of work. It turns the washing machine, grinds the wringer. It has an attachment on one end for sharpening knives, and polishing silver. Some days my wife takes it upstairs (it is a little thing about as big as a Hubbard squash) and it runs the sewing machine. There is another motor that runs the vacuum cleaner (I bought this whole outfit second-hand for $10) so there is no sweeping and dusting in our house, because we don't have any dust.

BATHROOM COMFORTS.—Upstairs in the bath room we have a light burning all night, burning low, for they make electric lights that can be turned up or down like a lamp wick. There is what my wife calls her "finger," a nickel-plated arrangement that looks like a small bicycle pump. If she needs boiling water during the night, or when I need it for shaving, she attaches its cord to a socket, and in 10 seconds she has a tumblerful of water boiling. Then, among our extravagances, we have a vibrator, which is a little electric massage machine. If one has a stiff neck, a lame back, or a sore arm, if one has a headache, or a pain in the side, turn on the vibrator, and it massages the trouble away in a jiffy. This is plain arrant luxury, away off in the country. I suppose there are other things, but I cannot think of them, probably because we have grown so used to them that we cease to think of them as wonderful. When I get my water-boiler attachment, and an electric pump to take the place of my hydraulic ram, and hot-water radiators heated by electricity in every room in the house, I shall begin to think that the little river that flows through our front yard is surely earning its keep.

AN ECONOMICAL SYSTEM.—The beauty of it all is that it costs nothing, except for the instruments themselves. The current is free, something no city person could possibly enjoy. My wife looks clean and cool, and rested; and the maid who does the routine in the kitchen actually hates to come back to the city when we move in the Fall, because she has to give up all these conveniences. I came downstairs early one morning recently and found Mary ironing. Like all old colored women she talks to herself, entertains herself with conversation. She was addressing the iron at this moment. "Iron," she was saying, as I entered, "I suttingly hates to leave you behind!" So if you happen to own a husband who happens to own a waterfall; or if he happens to have a neighbor who is willing to share a waterfall, persuade him to invest some of his savings in an electric plant. It may cost him some money to start, but it will add a thousand dollars in value to his farm for every hundred dollars he spends. But best of all, it takes the drudge out of housework. If he argues that he hasn't got the technical knowledge required to install such a plant, tell him that the readers of THE R. N.-Y. constitute a happy family, among whom there are at least a few of us who can answer questions and tell him how. Besides, all knowledge is bound in books, if one only takes the trouble to find the book.

Massachusetts. F. I. A.



ELECTRIC HOUSEHOLD DEVICES.

KITCHEN ELECTRICITY.—The Kansas Agricultural College suggests the following to housewives who dread the job of cleaning the family silver:

Get a zinc pan. Place a wire mat on the bottom to prevent the silver from resting on the bottom of the pan. Fill the pan with water and add a teaspoonful of soda and a tablespoonful of salt to each quart of water. Allow the silver to soak in this mixture five minutes. Take out the silver, wash and dry it. Oxidized silver should never be cleaned with this method as it will remove the oxidized finish. In case you cannot get a zinc pan, an ordinary dish pan may be used. Place two strips of zinc on opposite sides of the pan. If you cannot get zinc strips use two rows of mason jar lids. Pour in the mixture of salt, soda and water, and then place the silver in the pan, being careful to place the silver so that one end rests on one zinc strip and the other on the second zinc strip. After the silver has been in the water five minutes, it should be taken out, washed and dried. The secret of this way of cleaning is that the salt, soda, and zinc form a weak battery and electricity does the rest.

Household Conveniences

CARPET SWEEPER.—The vacuum cleaning carpet sweepers are of course a great improvement over the ordinary kind as they take up a great deal more dirt. Price $8.25 to $9.50, according to size.

MOP.—This is the regulation mop with a little wringing attachment on it. You simply turn a little handle (similar to the handle on an egg beater) just above where the cloth starts and it wrings out the cloth much dryer than could be done by hand, also much more quickly. The price is only 63 cents, and new cloths can be purchased for 15 cents each, although of course ordinary pieces of heavy cloth could be used just as well. This is a great improvement over the wringers attached to pails and is much less expensive.

WASHING MACHINES.—The best hand-run machine, to my way of thinking, was $6.50. Then there was one at $15 which was very good if you had the proper water pressure. It was run by a little water motor. All you had to do was to attach a small rubber hose (which came with the machine) to the cold water faucet, turn the water on and the round wooden disk with pegs attached which is in the middle of the tub turns around and washes the cloths. The water that is necessary to turn the machine is afterwards utilized to rinse the clothes.

CORNER PROTECTORS.—Last but not least are the corner protectors. These are three-sided brass things fastened with a nail in the centre which are put into corners to keep the dirt out, and until anyone has used them you will not realize how much time is saved when sweeping and dusting by not having to work at corners in rooms and on stairs to get the dust out. They are painted the same color as the woodwork so that you scarcely notice them. Price 35 cents for a box containing one gross.

MRS. FLORENCE BELLE.

"Grandpa's Christmas Story"

(Continued from page 1473)

plied to join the army. I thought he was joking at first—but he wasn't. I tried to argue him out of it by reminding him of his duty to his wife and two little girls. He said that it was on his wife's account he was going—he himself was an Englishman and an alien, but his wife was the last of a family that had fought in the Revolution and in 1812. "What!" I said, "you who are not even a naturalized citizen of this country, feel that it would be cowardly in you not to go when the nation is in peril? Then what in heaven's name am I? If you will wait until tomorrow morning I will either send word that I'm not coming or I will go with you." Then I went straight home. Tell them what you said, Libbie.

"Grammer sez, 'I told him that was what I had been waiting for ever since the President had called for volunteers. I said, "Go, and God be with you.'"

"'Well,' Granper sez, 'we went. That man proved to be as brave in battle as he had been gentle at the bedside of our little ones. His body lies at Gettysburg, but his influence lives in many lives besides mine today.

"'I came home from the war expecting to find a sorrowful wife and a desolate home. Instead I found Libbie cheerful and the house turned upside down by—but hold on; Lizzie and Mary, have we been a good mother and father to you?'"

"They both spoke at once—'The best father and mother that any children ever had.'"

"'Have we ever made any difference between you and Sophy?'"

"'Why, no! Why should you?'"

"'We shouldn't—but I'm coming to that. What I found when I came home was that the preacher's wife had died and no relatives could be found. So mother had taken her two little girls and made them her own. As soon as we could we adopted them legally; and right here I want to say that if those girls had been our own flesh and blood we couldn't have loved them more nor have received more love from them—what say, girls? You are the preacher's children.'"

"Well, sir! Mis' Holcomb, that was the greatest time I ever see! There was Maw an' Aunt Lizzie a huggin' an' kissin' an' cryin' all over Granper an' Grammer. They like to 'a squshed me. I tried to get down, but Grammer wouldn't leggo. Then they had a time with Aunt Sophy—all a cryin' an' smilin' at the same time. Uncle Jim went down on his knees a front o' the stove, with his back towards us, a tryin' to stuff in wood—*with the door shet!* Paw took off his glasses an' commenced to rub 'em with his hankercher.

"When Maw 'n Aunt Lizzie got so they could talk they told Granper 'n Grammer an' Aunt Sophy that if such a thing was possible, they loved 'em more'n ever, now.

"'Jim,' sez Granper, 'If you and Lizzie would adopt those little orphans that Will Potter is trying to support and can't—robbing his own children to keep his sister's out of the county-house—you would be conferring a favor upon him, a larger one upon his over-worked wife and a tremendous one upon yourselves. Judging from my own experience, I should say that they would soon twine around and bind up those poor, bruised, aching hearts of yours. And maybe, Jim, they would bring you back to God.'"

"Sure, ma'am, *she* was willin'. Uncle Jim wouldn't say he would nor he wouldn't. Tried to joke Aunt Lizzie about bein' on'y half a Yankee, with all her braggin'. But he didn't git nowheres."

"Well, no, ma'am, we didn't git no word fum them, but me'n Paw see Nick Van Buren this mornin' an' Nick hollers out, 'Hello! Ezry. Say! D'jer hear about the new addition to Jim Bunce's family? No? They got a pair o' twins—a six-year-old boy an' a four-year old gal. Lizzie's all wrapped up in 'em already.

"'N' say! Whadder yer think? When I come by his place, Jim was puttin' new clabberds on the front of his house—a hammerin' away, licketty-split, *an' whistlin'*. Yes, Sir, Whistlin'!"

"All right, Harold, I'm comin'."

:: "Farm Stories" ::

How Christmas Came to Valley Farm.

SNOW swirled against the windows and drifted high in field and lane. Old and gray, with its burden of a hundred years, the big farmhouse crouched, like a snowdrift itself, close beside the stream. Only the wood smoke curling from its great chimney and the banks of red geraniums glowing in the south windows, showed any sign of human life. Built for the big family that had once made its rooms ring with Christmas cheer, it certainly was a desolate place at holiday time, with big family and cheerful hearts both missing.

So thought the sad-faced little woman who moved listlessly to and fro in the big kitchen.

To-morrow, Christmas would be upon her once more, with its flood of memories, and its pretense of happiness. How she dreaded it! How often it seemed to come since the trouble about Uncle John's will!

Before that ever since she and Jennie had come home to the old house on Christmas Eve, happy brides of the Henderson twins, it had been the golden day of all the year. Across the wide hall lay empty rooms where that other bride had made a home. There, little feet had pattered and baby voices had made music; and, when her own wee son went back to Heaven, Sadie Henderson had tried to forget these other babies were not her own.

Why celebrate the day at all? What mattered anything, since that awful time when John and James had disputed over the will, and James had taken his little brood to the poor upper farm that was his portion.

As she looked out she could see the hilly fields and the bleak comfortless little house which now was home to the blessed babies. Three years since she had cuddled them in her arms; Billy and Betty were school children now, and little Ben had grown out of long dresses all unseen by her!

Her fingers had mechanically kept time to her flying thoughts; the oven door had opened and shut many times and pantry shelves were piled high with mince pies and snowy cakes. Cranberry jelly gleamed in the window; the great turkey lay ready for to-morrow's roasting; crisp loaves of bread added their share to the riot of homely odors that wafted out to the master of the house as he shook off the snow and shut the massive oak door.

"Um-um! Smelled all this clear down below the creek," he said. "I met the preacher just then and he looked so pinched I invited him and his whole family up to help us eat dinner to-morrow."

"But, John! the children—presents."

"Well, I did think of all that, even if I am a man. I just went back to town, and you look on the porch."

As they brought in piles of lumpy bundles, and the snowy tree, and heaps of "Christmas green," as sacks of oranges and boxes of candy appeared as if by magic, and big dolls jostled drums and skates, Sadie felt the hot tears pressing her eyelids. She saw three eager faces, up on the hill; she felt the tense waiting of the trusting little souls for the meager gifts poor crops would make their portion on the morrow.

Dark descended early on the wings of the storm. As Sadie fried the last batch of doughnut men by lamplight, John's voice sounded from the hall:

"Did you happen to keep the kids' red stockings? I've got so much truck I've a notion to fill them and hang them by the fireplace for those lean '*young reverends.*'"

Could she get out those dear, chubby stockings, knit for the three "B's," used once, and forgotten that awful day when they left?

One look at John's face decided her, and the bottom drawer of the old bureau creaked unwillingly open.

John gave a hasty glance into its depths, then huskily muttering something about "seeing to his fires," he fled. How could he have known that those crimson stockings were nestled among the piles of little dresses his one tiny son had never lived to wear?

Wilder and wilder the wind swept down from the hills; the nail heads on the queer old cleated doors, and the iron latches grew white with frost in spite of roaring fires. The wall sweep clock growled out 12 dolefnl strokes as Sadie crept into bed; another Christmas day had come.

Suddenly she found herself sitting up in bed with wildly fluttering heart; had it been minutes or hours since she lay down? Who had called her? Freezing blasts crept in at every crevice; perhaps it was only a thought of those gay geraniums that had crossed the bridge of dreams. Slipping into her warm wrapper she crossed the wide hall, where bulging red stockings hung beside the fire. As she reached the south window her heart stood still with fear; across the wild blizzard a light was signalling from the little house on the hill. Up and down four times; to and fro four times; the very signal she and Jennie had taught the hired hand's wife one Summer, years ago, before they had any telephone! She rushed to the 'phone now, before the tumult of the storm made her remember that the lines had been down all day.

"John! John!" she called. "There is trouble at Jim's; the old signal—look! oh hurry, *hurry!*"

One glance at the wavering light, in its pitiful appeal, and the big man responded. Soon they were battling through the drifts; mounted on the work horses, whose road-breaking experiences stood them in good stead now, they blindly struggled on. Up and up, toward that blinking light; at last, a stretch of hilltop road, wind-swept of snow then, benumbed and breathless, they heard Jim speak, and saw the open door.

"Thank God you saw the light!" said a shaking voice as he took off Sadie's wraps. "Get warm as quick as you can. Jennie is between life and death, and no way to get word to the doctor, and no road he could come over."

"John, go to the children."

All night long death fought for that precious life; all night the little house rocked in the storm's embrace, and husband and sister looked into each others' eyes only to see fear and anguish reflected there. All night long John Henderson sat with Jim's little son against his heart, and the storm that so long had raged there melted away. Just as dawn crept gayly across the hills the wind died down, and as the first pink light of Christmas day shone into that little room it saw Death vanquished, creeping silently away in the shadows of that fearful night. It shone on a mother's wan, but radiant face, and reflected too the joy of the childless mother, to whom the light had called, and who had won from Death the baby cradled in her arms.

Brighter and brighter grew the light, catching the brother-love, rekindled in the two men's hearts, and sunshine flooded every room as the old, but ever new joy of the children over this gift made it Christmas indeed.

As Sadie Henderson stood at the kitchen window the last brief hours seemed to her a miracle. Then she had looked up the hill toward the bleak gray house and along the barren years toward unhappy old age. Now as she gazed across the snow and toward the old house encircled by its fertile fields a little procession came into sight that foretold the happy future better than her thonghts could do.

Mounted on the sturdy farm horses, whose jingling bells could still be heard on the hill, were Bill, Betty and little Ben; behind, arm-in-arm, walked the brothers so long estranged.

The old home would open wide its hospitable doors, and even without a woman's presence, would give Christmas cheer to its own. Each chubby, crimson sock would find its rightful owner, for drifts along every road would keep the preacher's children from knowing all they had missed, and "next week" was to farther repay them for their loss.

And the little woman who yesterday had felt all joyful holidays but mockery, turned, with a full heart, to answer a baby's low cry; while in her ears rang the old refrain: "Peace on earth; good will to men.....For unto us a child is born; unto us a son is given."

:: Mary's "Rich Milk" Cow ::

A Heavy Yield

Of Verses from the Dairy Poets

Mary's Little Cow.

ON page 1372 we reprinted a little "poem" entitled "Rich Milk." It was a tribute to the Holstein cow by "The Office-Boy." We invited other

A COUNTRY DAIRY COW.

poets to come forward and tie bouquets on their favorite breeds—and here they are in large numbers.

Mary's Jersey.

Mary had a Jersey cow
With milk so rich in cream
That when she skimmed the golden pans
It fairly made her scream.

She dreamed of riches, comfort, ease,
And all her dreams came true.
Her sales of gilt-edge butter gave
Her all that she could do.

And then the neighbors came around
And bought her surplus calves.
For Mary was a thrifty maid
And ne'er did things by halves.

They everyone went dairying
With "Jerseys" for their motto,
While Mary supervised the sales
And rode round in her auto.

They made as much from butter as
They would have made from milk;
Then turned the skimmed milk into pork
And sported furs and silk.

They sent their products cross the sea
From New York to the Mersey,
And blessed the day that Mary bought
Her first imported Jersey.
—Cream Eater.

"Richest Milk."

They say I need a Holstein cow,
I think I'll buy just four—
One for each corner of the barn;
Kept just within the door.

So if a fire should break out
I'll milk their streams upon it.
The two per cent. of fat, no doubt,
Will help me milk them on it.

Insurance premiums I will save:
Buy gems and silks for Mary.
Sing Holstein praises for a fire
And Guernsey for the dairy.
—The Guernsey Office Boy.

Mary's Married Now.

Our Mary bought a Jersey cow,
Its milk was like fine gold.
Our Mary drove to town each day,
And this fine milk she sold.

The horse she drove, an old black cob,
A very poor horse indeed,
Was soon sold for another horse,
A better and finer steed.

The skeptic friends of Mary's
Looked on with wondering eyes.
For Mary had banked her money,
It now reached enormous size.

Next Mary bought an auto,
And soon another cow.
She did so very nicely
That, of course, she's married now.
—F. W. S.

Jersey Gold.

Our Jersey—we call her "Sunbeam"—
Her points are a dairyman's dream.
But she never gives milk,
And we never wear silk,
For our cow keeps us working in cream.

A visit we had from Aunt Min,
To escape the town's clatter and din.
She smiled at our butter
And proceeded to utter
"You've put too much coloring in."

No coloring there, I averred—
Save such as is done by the herd.
Our Jersey, "Sunbeam,"
And her daughters, give cream,
And our banker will vouch for our word.
—L. C. T.

"Richer Milk."

Mary had a brother, Zeke
(Feed is going higher),
Zeke owned a Jersey, spare and sleek,
And her sire was a purebred sire.

Mary's cow gave lots of milk
(Dry is the pasture's stream),
Zeke's cow gave much less in bulk,
But it was rich, yes rich, in cream.

Mary sold milk to a city man
(Hark; the feed man's laugh),
Zeke set his in a scalded pan,
And he raised—Oh, a beautiful—heifer calf.

Mary drew a monthly check
(Rich is the dusty miller),
Zeke packed butter in a crock,
And got—and jingled—his neighbors' siller.

Mary's gowns are getting worn
(Milk is more than water),
Zeke now toots an auto horn,
And will wed the miller's daughter.
—The Chore Boy.

A Jersey Cow.

My wife and I, we own a cow,
Her name is Margaret;
I want to say a word or two
"Lest we forget!" "Lest we forget!"

Of all the cows that ever lived
The Jerseys are the best;
So just give me a few of them
And you may take the rest.

This little cow's a jewel,
Of purest ray serene;
She beats everything I know
Of the breed they call Holstein.

If one is good, more is better,
Thought her neighbors with a sigh,
They all quit keeping "boarders,"
And have a herd of Guernseys nigh.

The Guernseys are keeping them, now,
In comfort and opulent splendors,
And have paid for better quarters, for
Themselves and their proud possessors.
—Helmer Femrite.

Exit "Black and White."

Farmer Spratt ate no fat,
(His wife had only lean)
But now they eat the best of meat
The world has ever seen.

The Jersey cow he's keeping now,
(Of course she's rather small)
But to give him water in place of milk
She's never had the gall.

Said farmer Spratt to neighbor Rock,
(Who met him driving kine)
"I've sold this stock, they're goin' the block,
No black and white for mine."

"The Jersey cow I'm keeping now,
(She gives both milk and cream)
This silk and satin, upholstered cow
I find is but a dream."
—S. J. B.

"Richer Milk."

Our Guernsey does not give the quarts
Of milk that Mary's Holstein did,
But on the pounds of butterfat,
I'm not afraid to bid.

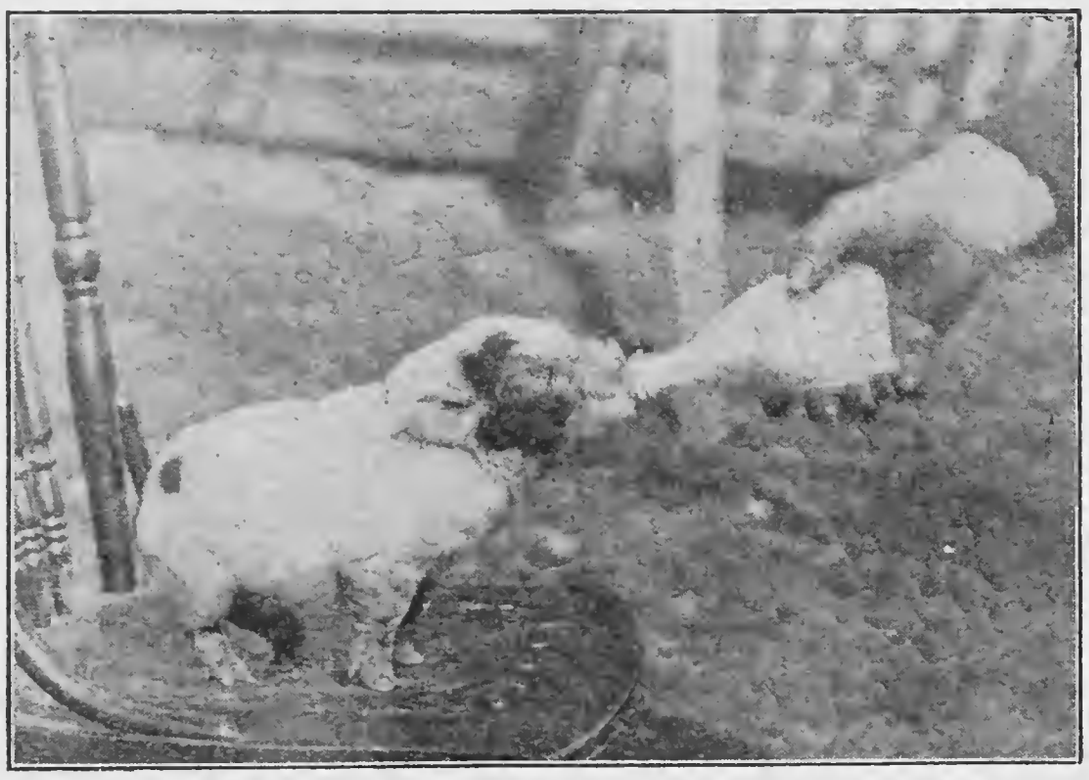
None dare to say the cream is thin,
My land! 'twould make dear Mary scream
To see the golden butter
That we make from Guernsey cream.

Our Guernsey gives the richest milk,
'Tis finer than dear Mary's silk,
Her calf is worth more diamonds rare,
Than ever Mary thought to wear.

On pounds of hay and feed that's eaten,
Her Holstein has our Guernsey beaten;
We'll save enough on buying feed,
To buy the auto that we need.
—"A Guernsey Poet."

When Molly's Old.

Our Molly had a Jersey cow
Whose milk, so rich in cream,
Would all turn into butter,
At least; so it would seem.



AN ARDENT ADVOCATE OF "RICH MILK."

This cow she makes the butter
For all upon the street,
And wins sweet smiles from all girls
I ever chance to meet.

She gives rich milk for all the kids
That on our street doth dwell,
And calves and lambs and little pigs
And other hogs as well.

My wife she owns the business end
And I the consuming part,
And to furnish food for this one end
It almost breaks my heart.

But when my wife a shopping goes,
Her wishes to fulfill.
She don't forget the office boy
That lives at Maple Hill.
—A. C.

Real Milk.

Our Mary had a Guernsey cow,
That gave milk as yellow as gold,
Does anybody wonder how,
Mary's dairy products sold?

Her neighbors cocked their heads and sneered,
"Why be fussing with a toy?"
They said there wasn't half enough milk,
To feed a little boy.

The Guernsey cow soon had a calf,
The prospect of a future herd,
Left Mary with a laugh.
That calf has now become a cow.

So Mary keeps on selling cream,
And by-products of the finest class,
Her products materialize many a dream,
Sounder and saner, than rivals brass.

Soon with her Jersey products
Our Molly bought a car
To take the golden butter to her patrons
Near and far.

One day the Jersey had a calf.
Our Molly thought it over,
Then sold the calf for a fertile farm
And cottonseed and clover.

The Jersey made more butter then;
The butter made more gold.
And Molly has a bank account
And will when she is old.
—The Farmer's Wife.

CHOKING.—"A child four years old, in New York City, recently choked to death on a peanut, which lodged in her throat."—R. N.-Y., page 1290. Serious cases of choking are not uncommon, and it is seldom that people know what to do in such cases, in the absence of a skilled physician; yet relief may be surely and quickly obtained by pouring the white of an egg (raw) down the sufferer's throat. This remedy never fails because the egg will slip down the throat and render the obstruction so smooth that it will readily pass on down. This remedy is just as effective for animals as for human beings. To administer the dose to an animal, however, is not always easy. The correct way is to place the white of the eggs in a bottle, raise the animal's head, thrust the bottle well back and empty.
MAURICE FLOYD.

:: Good Words ::

All the reward that I care for, is to know that I could do something to increase the circulation of THE R. N.-Y. You should have a million subscribers. I would like to help get them if I could, but the farmers here are none too prosperous and a dollar looks big to some of them. They don't know that they get ten dollars for one. A. M. A.
Burdickville, Mich.

I am very glad indeed to send these names to you, and as I have lived here for over 50 years, know many more that I could send if wanted, many of them are farmers, some not, but the paper is one to interest anyone, and I wish it might be in every house. My next birthday will see me 72; I mean to keep track of people and things as far as possible.
West Cheshire Ct. MRS. E. A. A.

I wish you all success; we are very much pleased with your paper.
Caldwell, N. J. MRS. E. F. S.

Your paper is "farm management gospel" to the thousands of farmers, from the man back on the hill farm who has never had what we are pleased to call "opportunities," to the college graduate and millionaire farmers who have had many. E. W. M.
New York.

R. N.-Y.—The power of the gospels lies in the fact that they carry the message of plain simple people often erring and weak as well as wise and strong.

How the Home Department of THE R. N.-Y. has enlarged since I knew it. Reading it is like entering a large and congenial family circle. MRS. S. E.
Massachusetts.

Your paper is worth more to me than the $1 could buy in any other paper, so I don't ask you to give me more than a year's subscription. I am not a farmer, but I can get more than $1 worth out of the poultry department alone.
Michigan. FRED SCHULTZ.

I like the paper dandy; a man sent it to me for a New Year's present last January, and so we will take it again when this year is up. E. W. JOHNSON.
Michigan.

I have nothing but good things to say of your paper. It is clean, sound and correct on almost everything. J. J. C.
Connecticut.

I have been a reader of your paper for a number of years, and think it the best farm paper printed. I very much appreciate the enlarged Woman and Home Department which you issue each month.
Montana. MRS. L. M. SCHRANTZ.

We have found THE R. N.-Y. so complete in every line of our needs that we cannot afford to go any further for advice. We shall not neglect to pass a good word, at least, where ever we can and shall consider we are doubly repaid in advance. A. L. P.
New York.

Quite by accident I took a trial subscription to THE R. N.-Y. at the Randall Fair and have found it so interesting that I am tempted to try my hand at farming. Can I have a little information?

R. N.-Y.—You certainly can—up to the limit of our power to give it.

I could not find fault with you if I tried. I know of no publication that could take the place of THE R. N.-Y. for me. W. C. T.
Virginia.

The issue of Nov. 14 I think is the best ever put out by THE R. N.-Y. since I have been with them. H. E.

I have been a subscriber to THE R. N.-Y. since the year you gave the little Sir Walter Raleigh potato as a premium, with the exception on the years spent in the Northwest, and wouldn't want to do without it now. W. E. B.
Pennsylvania.

A "Stranger" Became a Warm Friend.

I am somewhat of a newcomer in THE R. N.-Y. family. Always a subscriber to and an interested reader of agricultural papers I somehow missed yours, and knew it only by name and an occasional copy that chanced to drift my way, until about a year ago when the "Tribune-Farmer" sold its subscription list to you and it made its appearance in my R. F. D. box. I did not like the change a little bit. It seemed like losing an old and valued friend and acquiring a stranger. I will not attempt to tell how the "stranger" has worked its way up from an indifferent reception to the warmest welcome a paper ever got; the fact is enough. When it comes I do not put all the rest of the mail aside and read it first. I put *it* aside carefully. Then I throw the circular nuisances into the waste basket, read the letters and war news, and the local doings, and whatever else must be read to keep posted. THE R. N.-Y. is kept until the day's work is done, and supper over, and I am free to give my whole attention to the entertainment, the moving picture show of farm life and doings that you give us each week. There is little I "skip" entirely for it is all of things I am doing myself or seeing done or wanting to do. E. T. BAIRD.
Pennsylvania.

The Land of Fulfillment

A Story of Homesteading

By Rose Seelye-Miller

(*Continued from page 1379.*)

THE despatching of the letter, and the shale, was followed closely by the beginning of harvest, and as Nate and Norm worked with several others in this, they were kept busy for many days both early and late. The time came for making their final proof upon the land at the time specified in the advertisement which had been running in the local paper for the allotted time required by law. It seemed to them, and in fact was to most of the settlers a mere form. There was rarely any contesting of claims, and witnesses to prove that the land had been held according to the government law, were accepted without question or demur usually.

Nate and Norm, accompanied by Jim Maynard and Hank Jones, started for Wetasket in high spirits bent upon fulfilling the last requirement, which should entitle them to the patent of the land filed upon. Both boys felt that they had complied faithfully with every requirement of law, and even more, for they had relinquished their pre-emptions filing upon the same land as tree claims, in order to hold them according to the whole law. The Land Office was not yet open when they arrived in Wetasket, so Nate ran over to the postoffice, and came back with consternation written large on his sun-bronzed face.

"See here!" and Nate thrust an official looking document into Norm's hands. "What do you make of that?" Nate was as near incoherent as his friends had ever seen him, for he was invariably, serene and even tempered.

Norm read the notice dazedly, then Hank took it and exploded.

"Why the mean, low-down cuss! That ornery land jumper, James, has filed a contest on part of your land, taking the ground of your non-fulfillment of the federal law."

"That's it," Jim Maynard agreed succinctly. "There'll have to be a hearing, but we can witness for you, and you can go on and make your final proof just the same. He can't prove anything—he can't."

"Leave it to me," Hank urged hotly. "I'll go back and fetch the township to testify in your behalf. I'll get back here before two o'clock this afternoon, the time set for the hearing." So Hank dashed for the livery barn, where the horses had been so recently stabled. Hank started briskly westward, but as soon as he was well on the country road, he wound the lines over the dashboard, and took from his pocket a slip of paper. It was the government requirement for settlers. Hank read it over, carefully noting each item, "Frame dwelling—Land broken," then he stopped to comment—"Who knows which land is whose, and whether or not the cultivated land is all on one fellows claim or on all of them?" Hank inquired of the atmosphere in general. "A well," he read. "I'll bet they haven't any well, they've always watered at the creek! Hmm!" and unwinding the lines again, he sent the young dapples dancing homeward.

Hank rallied the men he wanted for extra witness, and all cheerfully turned from work to help out these friends who were in trouble.

"It's blamed queer that fellow wants that land so bad, it's the poorest land in the country. Probably wants to be bought off with a few hundred," Hank mused.

"Ike," said Hank to a hulking fellow, "You get your little spade and go down the valley, and dig a well. Dig it until the water runs into it, good and plenty—it won't need much digging for all that low land is water soaked from the creek. Then hike over to my claim and take my old windlass, and weather-beaten well-top, and put it up on the new well, and do it quick. Don't say a blamed word to anyone."

"Depend on me," Ike responded heartily and went to do Hank's bidding.

Hank then went to the settlers on the west, and set some of them to making an impromptu survey of the cultivated land to determine whether or not each quarter section had at least the required number of acres. "If it lacks an acre or two on any one of the quarters, then set to work and plow it. Set as many teams to work as you like, but have it done."

The whole township seemed wrought up over the contretemps of Nate and Norm, for the settlers in those days stood by each other tooth and nail, and the would-be claim contester or claim jumper met with no uncertain reward.

True to his word Hank was back in Wetasket at two o'clock in the afternoon, and ready for the hearing. There was a formidable array of complaints arrayed against Nate and Norm.

"Absence for a period of four weeks the first year of settlement."

A second absence of some weeks in Winter, and non-residence during one Winter. Nathan Lee living wholly on the Norman Duane tract of land."

"That Nathan Lee and Norman Duane were holding two quarter sections of land, each with but one residence."

"That the improvements had practically all been put upon only one of the four quarter sections, instead of dividing up the holdings and improvements."

"That the breaking and cultivation had been done almost exclusively upon only one of the quarter sections."

"And furthermore, while the law required a well, no well could be found upon any one of the four quarter sections owned, or claimed by said Nathan Lee, and Norman Duane."

The complaint was taken up clause by clause and sworn to. The first clause, was explained away, because of the necessity for earning a living the first Fall of settlement. The second absence was explained as absolutely necessary to all the settlers of that section, when Norman Duane had gone into Edmonds County to bale and ship hay to save the live stock from starving. The third charge, that Nathan Lee and Norman Duane were both holding two quarter sections of land with but one residence, and illegally, was waived, because the tree claim required no residence.

The fourth, that the improvements were mostly upon one quarter section, was admitted, because of convenience in attending to live stock, etc. All claims having the needful improvements required by law.

The fifth charge: that the breaking and cultivation of land had been done principally upon one quarter section to the exclusion of the others, was met by the counter—that the other land was untillable, having a heavy deposit of shale.

There were twenty men to corroborate all this, but the last and final clause referring to the well, Hank Jones begged to say that a well existed. It might not be known to all the witnesses, but that he knew and would make affidavit, that a well with plenty of water, was located in the valley plat of the contested land. That the well, as far as reasonable survey could make it do so, touched all four quarter sections being located centrally in the valley plat, that constituted a part of all four quarter sections under discussion. That the well while not entirely curbed had a top and a windlass and said top would show use and weathering.

This point was duly sworn to although some of the witnesses were mystified, still they believed that Hank would not swear to anything untrue.

Mr. James, sturdy, stubborn and very much the same as he had been five years earlier, when he had tried to jump the creek claim, was fuming and almost foaming at the mouth, to witness the ease with which all his points of contest were met and sworn against.

The final proof papers were signed, and they were ready to be sent to Washington from whence should come the patent which should entitle Nate and Norm to the land beoynd all cavil and all contest.

"You lied about that well," Mr. James said rancorously to Hank as they met on the street afterwards.

"You lie yourself, if you say I lied. If you want to see it, all you have to do is to follow us out and use your eyes. If I find you sneaking around that land in the dark, I'll shoot you as I'd shoot any other skunk. Moreover, I'm of the opinion that you were hired to do some other man's dirty work and that he is beaten in his low-lived, game of sneak-thief."

"What sort of gaff was you giving about that well?" Norm inquired, as they were going homeward.

"No gaff at all," Hank replied nonchanantly.

"We won't make anything in the long run to swear to a lie," put in Nate. "I think we'd got our papers just as quick—and I'm in for a square deal."

"So'm I," Hank agreed. "And if I'd sworn that there wasn't any well, and if you'd sworn there wasn't any, we'd all sworn to a lie. You'll see, and you'll see the windlass shows some wear. Can't you trust your Christian Aunt, in a little matter like that?" and Hank laughed infectiously.

"We're mightily indebted to you fellows anyway," Norm said, when the procession drove up to his shack.

"Mightily indebted, now and forever," echoed Nate.

"Come on in, boys," invited Hank. "And I'll make you some lemonade, with water out of the best well in the township." Hank took a milk can and trailed off down the hill, followed by an interested crowd. He stalked along until he came to a bend in the creek bank, and there true to his word, stood the weather-beaten windlass, over a well of sparkling water.

"More miracles and mysteries," cried Nate. "Here's to Hank, the beatinest one of all!" and a cheer went up for that gentleman, a cheer neither limited, in numbers nor noise.

It was late when the party broke up and then Hank, meandered down the creek bed, and along the bank, until he came to the weather-beaten windlass, swung over the very shallow well below. He scanned the landscape thoughtfully.

It was after one o'clock, when he heard the sound of wheels upon the prairie road and then the sound grew more muffled as though the wheels were rolling over sod. Back and forth the wheels seemed to go, and finally came to a standstill. Hank waited in expectant silence.

"We've driven about all over the land," said a low voice. "And if there's a well, it's hard to find."

"It's probably just a hole in the creek bed," came Mr. James's voice. "I know the valley plat, and I'll go down and see. If there isn't a well it will impeach the whole testimony."

"If we can get hold of this land," the other voice asserted, "we can get a good round price for it."

There followed the crunching of shale, as somebody, let himself down carefully half the precipitous way, to the valley, and then there came a tumbling rush, and the valley had been reached, rather too quickly to suit Mr. James middle-aged anatomy. In fact, he rolled nearly to the feet of Hank Jones, who merely drew himself up in a tight knot and waited developments. He was truly enjoying himself.

James swearing and rubbing his bruised places, rose and contemplated, viciously, the weather-beaten windlass. "It's all a bluff," he stormed, half aloud, but he swung the bucket high, and bent far over the curb. It was too dark to see, and he dropped a lighted match into the depths, this light revealed to him, instantly the pool below with the water rising within three feet of the top of the well.

"Hades!" he ejaculated, but before he had lifted himself up, Hank Jones with a deft shove, thrust him toppling over the edge of the framework, where he hung for a breath and then lunged into the water below. There was a terrible splashing and gurgling, mingled with imprecations in the well.

"Are you satisfied that there's a well on this land?" Hank asked suavely.

"I'll have it on you for this," Mr. James growled, fairly gnashing his teeth.

"You'll have to get out first," Hank mildly suggested.

"I've had enough of this, now get me out," Mr. James stormed angrily.

"If you'll call this deal off, once and for all, and tell who the critter is who's bought you on to it, I'll leave you and you can get yourself out. But I won't stir a step till you do." Hank said pleasantly, but decisively.

"Haul me out of here," he shuddered, his teeth chattering, and hashing his words up into pieces as he tried to talk.

"Who's your backer?" Hank was grim.

"Give me the rope, I guess my life's worth more to me, than Measman's money."

But Hank did not give him the rope, instead, he gave a piercing whistle, and then called, "Measman, Measman." But no answer came. Then he gave another piercing whistle and several "halloos."

"I guess he's left you," Hank said cheerfully. "Curs don't fight much for each other."

Fancy Silk pieces for Christmas novelties. Handsome assortment. Trial package, 25 cents. Satisfaction guaranteed or money refunded. JOHN F. LAMBERT, 58 Grattan Street, Brooklyn, N. Y.

ONE DOLLAR buys 150 envelopes and letterheads. Cards, tags, labels, either, 125, 50c.; 300, 90c.; 500, $1.40; 1,000, $2.40. We prepay express. Chatham Courier Co., Chatham, N. Y.

Christmas Surprise Boxes

Solve your Christmas shopping problem

Groceries and candy of fine quality, packed in unusually attractive Christmas boxes. Splendid gifts for sending home to "the old folks," substantial remembrances to relatives and friends—in fact, these boxes solve the Christmas shopping problem for everyone. We send direct to any address saving you all trouble. $1 to $10.

Our Catalog is filled with hundreds of other valuable suggestions for Christmas gifts—jewelry, leather goods, cutlery, furniture, clocks, etc. Wonderful values for little money—because we sell direct at factory prices.

Write now for special Christmas offers Catalog No. 40.

NEW ENGLAND MERCANTILE CO.
64-70 India Street BOSTON, MASS.

4-BUCKLE One Piece ARCTIC

FOR MEN AND WOMEN

Extra quality. Made all in ONE PIECE.

With full snow excluding tongue, soles made of best quality pure gum rubber, guaranteed to give lasting service. Tops thoroughly rubberized and lined with pure wool flannel, making it absolutely waterproof and cold proof throughout. Retails for $3.50 to $4.00 everywhere. **Send $2.29 to-day** to obtain the greatest overshoe value ever offered. We deliver, **POSTPAID**, to your home. **Men's Sizes, 5 to 13; Women's Sizes, 3 to 8.** Every pair sold with an absolute GUARANTEE of satisfaction or money refunded. State size of shoe to insure perfect fit. Catalog on request. **A. WEINBERGER & CO., 112-113 South St., New York. Dept. X.**

LET US TAN YOUR HIDE.

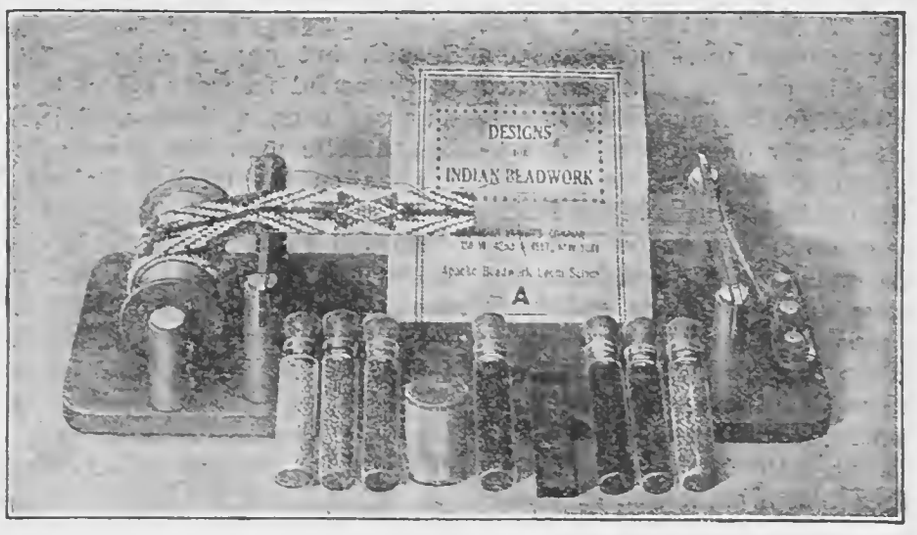
Cattle or Horse hide, Calf, Dog, Deer or any kind of skin with hair or fur on. **We tan and finish them right;** make them into coats (for men and women), robes, rugs or gloves when ordered.

Your fur goods will cost you less than to buy them, and be worth more. **Our illustrated catalog** gives a lot of information which every stock raiser should have, but we never send out this valuable book except upon request.

It tells how to take off and care for hides; how and when **we pay the freight both ways;** about our safe dyeing process which is a tremendous advantage to the customer, especially on **horse hides and calf skins;** about the fur goods and game trophies we sell, taxidermy, etc. If you want a copy send us your correct address.

The Crosby Frisian Fur Company, 571 Lyell Ave., Rochester, N. Y.

Indian Bead Work



NOTHING is more fascinating or more in vogue at this time than **Indian Bead Work articles.** We have procured an outfit for making these articles, which will be sent, delivery charges prepaid, for

ONE NEW YEARLY SUBSCRIPTION

OR

THREE YEARLY RENEWAL SUBSCRIPTIONS

(One of these may be the renewal of your own subscription for one year.)

This outfit consists of a Patented Loom for making articles, an instruction and design book, a spool of cotton, twelve H. Milward Sons' needles, seven bottles of colored beads—dark blue, green, light blue, black, red, yellow and white—a complete outfit to start the work.

Every woman knows and appreciates the value of these home-made articles.

Your neighbor needs *The Rural New-Yorker.* If he is not a reader get his subscription. If he is a subscriber get his renewal.

These articles will not be given with subscriptions—they are sent as rewards only (in place of cash) to our subscribers and friends who, acting as agents, send us subscriptions as indicated.

THE RURAL NEW-YORKER, 333 W. 30th St., NEW YORK CITY

The Christmas Tree

"It blooms one day in all the year,
Not when the roses blow,
But when the leaves are brown and sere,
Or robed in gleaming snow.

"Upon its branches bending low,
All beautiful to see.
Both flower and fruit together grow.
O wondrous Christmas tree!"

EVERYONE who prepares a Christmas tree knows that its chief requisites are the three G's—gaiety, glitter and gifts. Unless it holds the eye by its color and sparkle, and arouses anticipation by the sight of mysterious parcels, small and great, that mean some sort of gift for every beholder, it has not carried out its mission.

The tree itself must be well anchored, and secure against tipping; iron supports are sold in toy departments and hardware stores for this purpose, while wooden blocks or crossed pieces of plank with a large auger hole into which the trunk of the tree is securely fastened, do very well when anchored down with weights. We like the appearance of a large tub for the tree to stand in because it keeps the lower limbs off the ground, and one can show off, in this way, a tree that is not too unwieldy for an ordinary room. It is not difficult to put a brace in the bottom of a tub with an auger hole to receive the trunk, the branches being trimmed up to the right height, then weight the tub with earth or stones. This is absolutely secure; the tub may be draped with evergreens or moss, flecked with cotton batting crystallized with alum to represent snow. If electric lights are used, the batteries are hidden under this trimming. The wires, with their green covering, are disguised by the foliage. An electric outfit with eight lights, red, blue, green and white bulbs, costs $2.50; with 16 lights $5. Batteries are 15 cents each; two are required for eight lights, three for 16. We still think old-fashioned candles, twinkling all over the tree, are the prettiest of all lights, but we believe in "safety first," and they are entirely too dangerous among the inflammable branches, with the further risk of contact with celluloid toys. If electric lights are beyond reach, we would leave the tree unlighted, and depend on color and tinsel for the effect.

Popcorn and cranberries are usually accessible, and are among the prettiest festooning material. Have plenty of both, and also make sugared popcorn into "snowballs," to be hung on the tree by red ribbons. A fashionable candy store on Fifth Avenue had these popcorn balls wrapped in thin paraffin paper and tied with red ribbon for Thanksgiving favors, and they are pretty on the tree. A surprising amount of glitter can be provided by using the liquid gilding sold for fancywork; pine cones are very attractive thus treated, also nuts, while a jack-knife artist can make anchors, hearts and stars from soft pine, which are very effective after a golden bath. These suggestions are not offered to those who can walk into a department store and order whatever they want, without thought of cost, and who thus miss a great deal of wholesome fun.

Strings of tinsel, and the various fancy ornaments, vary little from year to year, whether bought at a big toy shop or at the five and 10 cent store. This year there is a great variety of fruit, apples, pears, oranges lemons and grapes, made of some sparkling composition, and more gorgeous in coloring than the pictures in a nursery agent's catalogue; they are not edible, and may be kept from year to year. Fancy boxes and cornucopias for nuts and candy are quite inexpensive and may also be made at home if one is provided with neat fingers and colored paper. One may also put candy and small gifts in little "prize packages" made to imitate oranges; the package is made round, then wrapped in deep orange crape paper, gathered together at the top, where some leaves of green paper hide the closing. These are very pretty on the tree. The children usually expect to see "Christmas stockings," too, which are quickly made from pink tarlatan, and filled with popcorn. There should, of course, be some candy canes and baskets made of that pink and white striped peppermint candy so dear to children, because no Christmas tree was ever regarded as fully satisfying without them. A roll of crape paper, geranium red, used as wrapping for small parcels, will also add color to the tree, and may also be used to make round "fruit," with green leaves at the top, like the crape paper oranges.

We always prefer to crown the tree with a Christmas star, which may be made of gilded wood or gilt paper over pasteboard. A Santa Claus doll at the foot of the tree, or snuggled away among the branches, is quite easily made, the long robe being red flannel with cotton batting trimming, the rosy face surrounded by a cotton batting beard. With the head of a discarded doll and the contents of the ragbag to furnish a foundation the jolly St. Nicholas may be a real member of the family.

"BOTH FLOWER AND FRUIT TOGETHER GROW."

Some of our friends disapprove of Christmas trees, on the ground that it encourages the destruction of our forests. The fact that thinning is a necessary process of forestry seems to be overlooked, but anyone who disapproves of the graceful fragrant forest tree for this purpose may, without scruple, build up a synthetic tree, like those stout-hearted women on the treeless Dakota prairies, who made the first Christmas tree ever displayed in their district with a scantling for trunk, and the sticks out of their window shades for branches, the bare wood draped with "made-believe" foliage of green paper and carpet rags!

E. T. R.

THE Department of Agriculture at Washington has issued Farmers' Bulletin No. 607 which is of special interest to farm women. It is entitled "The Farm Kitchen as a Workshop," and is written by Miss Anna Barrows, a well-known teacher of domestic economy. Miss Barrows says that the kitchen is the workshop of the home, and she might well have said the most important shop connected with the farm. She says that there are 6,000,000 farm kitchens, and including the relatives and hired helpers, 8,000,000 women spend their working lives inside these kitchens. This shows the necessity of making this kitchen as comfortable and well planned as possible, for it is a serious thing when 8,000,000 women are compelled to work under conditions which do not give them a chance to be truly efficient. It is impossible to give anything like a synopsis of this bulletin. It ought to be read by every woman in the country who is ever expected to get up a tasty meal, do a week's washing or any of the other things which count for so much in household work.

Christmas Presents and Christmas Questions

Household Questions.

[The following questions among others have been answered by Miss Edna S. Knapp. All such questions are welcomed and will receive prompt attention.]

Old Magazines.

WHAT do you do with your old magazines? I have a year's accumulation on hand. W.

We send ours to a friend in the hills. Isn't there someone in your neighborhood who would be glad of them? If not, write to your denominational missionary society.

Crocheted Fascinator.

My mother-in-law lives in the country and is very old-fashioned in her tastes, but very dainty. She wants a fascinator for Christmas. How can I make one and how much does it take? What else could I get or make for her? F. G. B.

Half a pound of Shetland floss is ample for a fascinator. They are usually crocheted in shell stitch. Begin with six chain and put one shell, five double crochet, in the middle, two shell in next row, three in the next and so on. Put a whole, instead of a half shell, at the end of each row, that widens it. Continue until you reach the desired size. For border use 10 chain stitches caught into the edge with a single crochet. Or you can knit one, starting with three stitches and widening at the beginning of every fourth row until you reach 13 inches in width, then narrow once at the beginning of every fourth row. Use the same border as above. Medium gray is a very pretty shade to use.

Why not make a collar and cuff set from a fine hemstitched linen handkerchief? Cut off a strip 1½ inches wide from one side and put on a narrow lawn binding. Then cut other strips for cuffs, so a hemstitched corner will overlap the hemmed end. There will be linen enough left in the center to make more cuffs, if you like. These are old-fashioned but many elderly women still wear them.

A Box of Possibilities.

A dear friend has had a long illness and lives where she can't get many things to entertain her. I want to send her a "Box of Possibilities." Can you help me? H. P. C.

Fancy work materials of various kinds would be best. Have the work commenced and everything needed for its completion included. I wouldn't put in anything that involved too much work. A pretty stamped corset cover or small centerpiece would be nice. Perhaps a tatting shuttle and book of instructions or some skeins of Shetland floss, wood needles and a book on knitting, would be better. Why not get some of the pretty Christmas cards and folders to be tinted by hand and send materials for coloring? I know a museum art student who pays her way doing this. If she is strong enough, start a raffia basket until it is easy to hold and put in materials and directions. You will think of things enough when you begin to pack your box.

Gifts by Mail.

What kind of gifts can be sent in a letter? My friends are at a distance. I want dainty things that are not too much expense or trouble. C. D.

Handkerchiefs, flat tailored bows for neckwear, hair ribbons for young girls, flat little packages of sachet powder, address books, bookmarks, letter openers and many other things can be enclosed in letters. One lady is buying the little books with soap leaves or leaves with face powder and making for each book slip covers of Dresden ribbon, these are very popular with women who travel.

Gifts for the Blind.

What can I give a blind cousin? She wears white aprons, but I have made pretty nearly every kind. W.

If you live near enough, why not send carnations or a thrifty plant with scented leaves? A box of chocolates would be welcome, too. I just saw a little round apron made for a Christmas sale: it had a three-inch circular facing, inside that connecting ovals featherstitched in two shades of yellow. Yellow ribbon was slipped under straps of lingerie tape an inch apart on the band.

Domestic Science Bulletins.

Can you give me a list of Farmers' Bulletins used in schools of domestic science? Should think they would be of great value to housekeepers. M. M.

A Michigan school uses the following in general cooking classes:

535, Sugar and Its Value as Food; 142, Principles of Nutrition and Nutritive Value of Foods; 203, Canned Fruit Preserves and Jellies; 249, Cereal Breakfast Foods; 295, Potatoes and Other Root Crops as Food; 256, Preparation of Vegetables for the Table; 582, Green Vegetables and their Use in the Diet; Eggs and their Uses as Foods; 490, Bacteria in Milk; 413, Care of Milk and its Use in the Home; 363, Use of Milk as Food; 332, Nuts and their Uses as Food.

Ask for Farmers' Bulletins from Division of Publication, U. S. Department of Agriculture.

Dressing for Warmth.

We have bought an old house, once a Colonial tavern. It is lovely in Summer, but cold in Winter. How can I dress to keep comfortable? I haven't much time or money to spend on my problem. N. B.

If you do all your own work you cannot dress without thought of time spent over the stove or doing some heavy work. Try the new double-body union suits. Be sure your corset fits and leaves you free to move easily. Wear medium weight cotton stockings and felt shoes. Make corset covers of outing flannel and a warm petticoat of wash flannel. Use galatea or eden cloth for your house dresses, and keep a wrap of some kind handy if you are chilly when you sit down. The old circular shawl is good for this. Wear wool dresses or flannel shirtwaists in the afternoon. Put a thick rug where you stand much by stove or sink if the floor is cold.

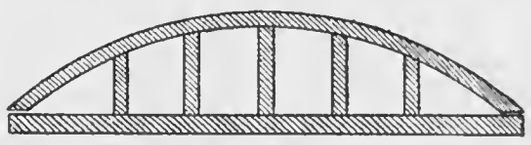
Making a Newport Scarf.

What is a Newport scarf and how do you make one? E. D.

A Newport scarf is a long, narrow knitted affair, 16 to 18 inches wide and about two yards long. It is worn as a shawl in Summer and as a muffler or head scarf in the Winter. Eight skeins of Shetland floss will make one, six skeins of the ground color and two skeins for stripes and fringe. Cast on 100 stitches and knit 12 ridges, 24 rows, plain with the body color. Then join the second color and knit six rows as follows: First row, knit across plain. Second row, seam clear across. Third row, knit one, over, knit one, over; etc. Fourth row, seam two together clear across. Fifth row, knit plain. Sixth row, seam clear across. Repeat both stripes until the desired length is reached, ending with the body color. Add four-inch fringe at each end; the scarf should be 64 inches long.

Sewer System for the Country Home

DIFFICULTIES ENCOUNTERED.—An objection frequently raised by country folks against the installation of bath-room outfits and kitchen sinks—conveniences greatly prized when once established—is that the drainage is very hard to care for. Many farmers remembering their trying experiences with cesspools and underground sinks, have lost faith in the efficiency of rural plumbing and drainage systems. Thanks to a fortunate biological discovery, there is now little need of such distrust; the country



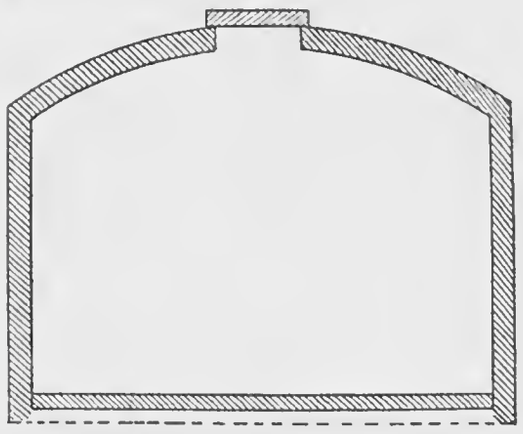
FORM FOR CONCRETE ARCH.

home that utilizes the septic tank can dispose of its house drainage quite as easily as the city home can with its efficient sewer system.

THE SEPTIC TANK.—The purpose of this article is to describe a septic tank established by the writer for the boarding hall of a college located in a town unprovided with a sewer system. This tank has been in operation two years and is giving perfect satisfaction. It easily takes care of the bath-room waste occasioned by 25 boarders, and in addition thereto the sink drainage from the busy kitchen. The janitor estimates that 20 or more barrels daily pass into the tank. Before describing the structure of this tank a few facts concerning septic tanks in general will not be out of place. A septic tank may be defined as a dark, moist, warm chamber in which certain bacteria attack and decompose organic matter. It has been found by analysis that more than 99 per cent. of house drainage is water. When such waste is emptied into a septic tank it is attacked by the bacteria and disintegrated, and other kinds of bacteria, including those harmful to man, are destroyed at the same time. The outflow from the tank consequently is almost wholly water and is quite free from germs and obnoxious gases. This water is, of course, far from being pure, there being considerable odor and a supersaturation of organic and mineral matter; it is, however, much less a pollution agent than before, and not nearly so likely to endanger wells in the immediate vicinity.

PRINCIPLE OF THE TANK.—A septic tank, then, must provide three things: First, an airtight chamber for receiving the house drainage—hereafter called the septic chamber—and in which the particular bacteria may actively carry on the work of decomposition; second, some automatic device for continuously removing the excess water from this chamber; third, an absorption chamber to receive this excess water, and from which it may sink away into the soil. Particular attention should be given to the first and third of the requisite just named, for upon them the success of the septic tank largely depends. If the septic chamber is not warm and airtight the particular bacteria doing the work of decomposition—biologically called anaërobic bacteria—do not thrive and decomposition is incomplete. If the absorption chamber for any reason retains much of its water the circulation through the whole tank is interfered with and its automatic action soon ceases.

GENERAL PLAN.—The tank now to be described shows how all of these needs

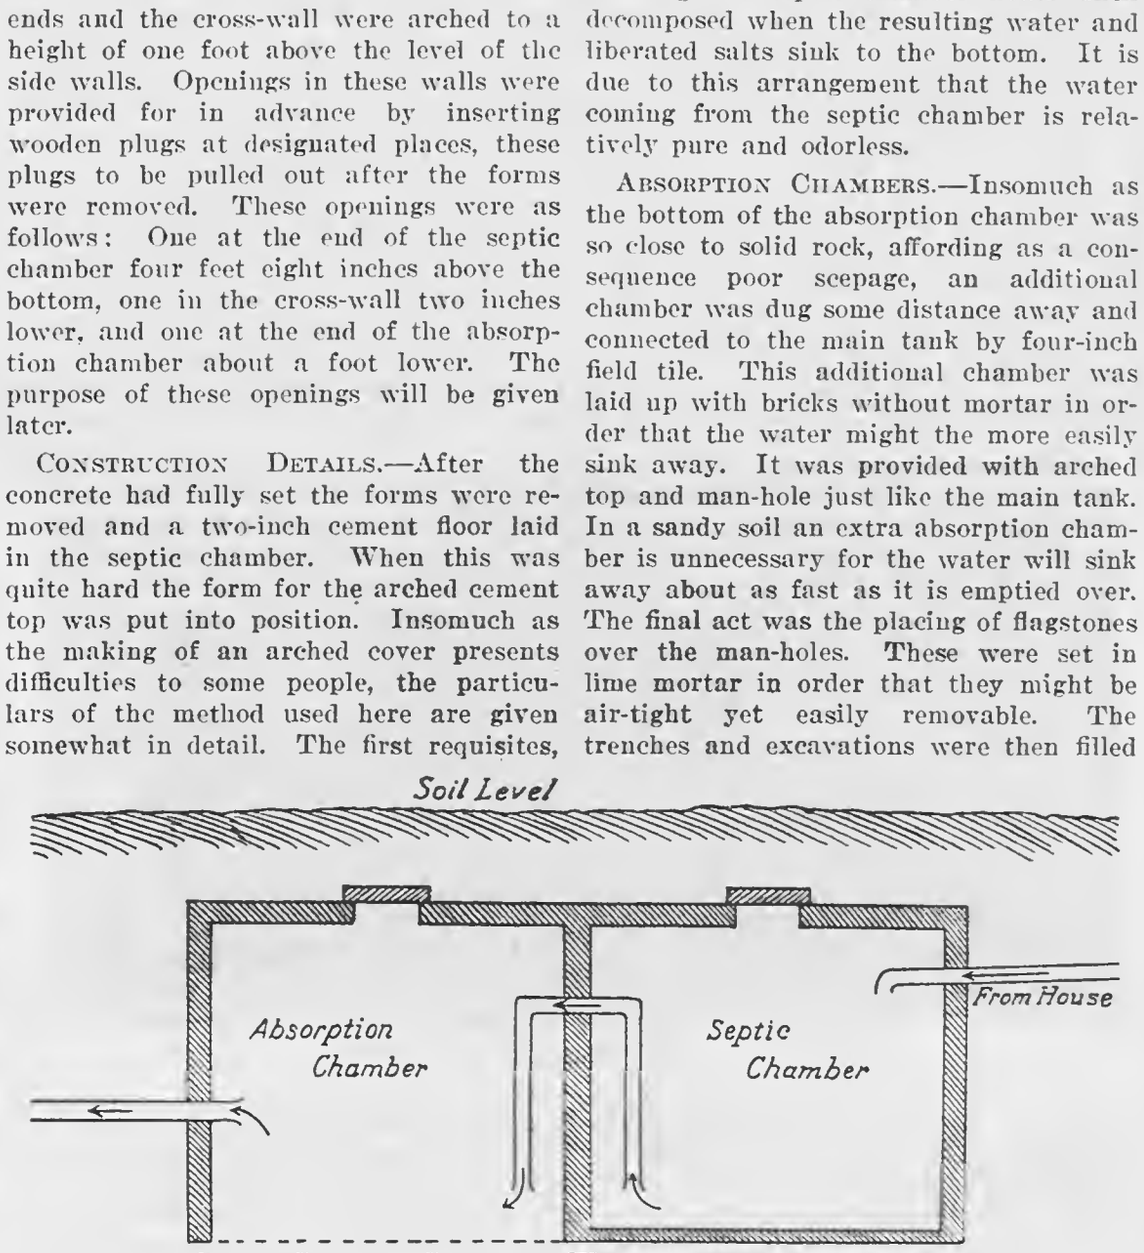


ONE END OF THE SEPTIC TANK.

have been provided for. The accompanying figures—one a vertical lengthwise section, the other a vertical cross-wise section—show how the chambers, cross-wall, inlet pipe, siphon, and outlet to additional absorption chamber were provided for, and enables their arrangement to be seen at a glance. An examination of these figures will greatly assist in understanding the following description:

The tank was located about 30 feet from the house. A space 16 feet long, seven feet wide, seven feet deep, was excavated, the walls being left straight and smooth in order to form an outward wall for the concrete. The original plan had been to dig eight feet, but rock being encountered it was impossible to go deeper than seven. The box structures seven feet five inches long, six feet four inches wide, placed so as to be everywhere four inches from the earth sides, made the forms. Concrete was shoveled in to a depth of five feet, thus forming four-inch side walls and a six-inch cross-wall. The ends and the cross-wall were arched to a height of one foot above the level of the side walls. Openings in these walls were provided for in advance by inserting wooden plugs at designated places, these plugs to be pulled out after the forms were removed. These openings were as follows: One at the end of the septic chamber four feet eight inches above the bottom, one in the cross-wall two inches lower, and one at the end of the absorption chamber about a foot lower. The purpose of these openings will be given later.

CONSTRUCTION DETAILS.—After the concrete had fully set the forms were removed and a two-inch cement floor laid in the septic chamber. When this was quite hard the form for the arched cement top was put into position. Insomuch as the making of an arched cover presents difficulties to some people, the particulars of the method used here are given somewhat in detail. The first requisites,



CROSS SECTION SHOWING WORKING OF SEPTIC TANK.

namely supporting arches, were made by nailing 1x6 boards perpendicularly to the wide face of 2x6 planks. The middle upright was 12 inches high and the others shaded away to three or four near the ends. A flexible board was then bent down upon these uprights and nailed securely to them and to the 2x6 plank at its ends. The result of this is an arch capable of supporting a heavy weight. Eight of these arches were needed for this particular tank. They were supported from below by braced 2x4 pieces, and at such a height that the overlying boards would line up flush with the top of the ends, cross-wall, and sides. The overlying boards were nailed to the arches only sufficiently to keep both in place. Too much nailing would have interfered with their easy removal later. Provision was made in the forms for 14x16-inch manholes into each chamber.

CONCRETE AND PIPE.—The concrete for the top was made rather rich, a mixture of one part cement to four of sand being used. This was laid down to a thickness of five inches at the middle, thus forming a top that has since proved amply strong. After about a week the concrete was sufficiently hard to permit the removal of the form, which was easily pulled down from the inside and removed through the manholes. The conducting pipe from the house to the septic chamber was made of four-inch glazed sewer tile and entered the septic chamber through the opening previously referred to. Its decline, which was about three inches, has proved sufficient to drain the house pipes quite rapidly. A U-tube, made by a local hardware man of four-inch iron soil pipe, is used for conveying the excess water from the septic chamber to the absorption chamber. The figure shows just how it was placed. It was firmly cemented into the opening in the cross-wall previously mentioned and with the open ends down and about eight inches from the bottom. Its action may as well be explained now; when the septic chamber began to fill up with sewage a part rose up in the tube eventually being pushed over by the weight of the excess into the absorption chamber where it was absorbed by the earth. Every additional inflow into the septic chamber causes a recurrence of this process, and so continues as long as the tank is in good working order. The object in placing the U-tube in this inverted position is that it may carry over first the bottom water which is purer. This is due to the fact that all organic matter entering the septic chamber floats until decomposed when the resulting water and liberated salts sink to the bottom. It is due to this arrangement that the water coming from the septic chamber is relatively pure and odorless.

ABSORPTION CHAMBERS.—Insomuch as the bottom of the absorption chamber was so close to solid rock, affording as a consequence poor seepage, an additional chamber was dug some distance away and connected to the main tank by four-inch field tile. This additional chamber was laid up with bricks without mortar in order that the water might the more easily sink away. It was provided with arched top and man-hole just like the main tank. In a sandy soil an extra absorption chamber is unnecessary for the water will sink away about as fast as it is emptied over. The final act was the placing of flagstones over the man-holes. These were set in lime mortar in order that they might be air-tight yet easily removable. The trenches and excavations were then filled in and subsequently seeded to grass: rocks being left to mark the position of the man-holes.

Use for Sugar Sacks

WHAT use are we making of the numerous cloth sacks, big and little, which are constantly coming in with sugar, flour, salt, graham flour, etc.?

Instead of cutting the sacks open, ravel the threads with which they are sewed and thus preserve them intact and prevent any threads falling into the contents. Nearly all flour sacks can be used for dish towels, discarding the old and thin ones which shed lint and do not absorb water. Salt sacks are pure white and quite soft after washing. The 10-cent size make good every-day handkerchiefs to be used in time of hard colds. They should be raveled and hemmed on the machine. Sugar sacks are of light weight unbleached muslin. They make useful Summer underwear for children, last fairly well and the only expense is the labor which is not great if the machine is used everywhere possible.

Very serviceable petticoats can be made for school girls by cutting the 25-pound size in half and finishing the bottom with a gingham ruffle. The 25-pound size is just right too, for jelly and cottage cheese bags, and plenty are saved for putting away dried apples, seeds, nuts, etc. Small sacks colored and pieced together make very pretty quilts.

Occasionally one gets a good canvas sack, and these we hail as treasures. Every last one is made into mittens. For Winter I line them with old sweaters, pieces of flannel or any warm material and for handling stone, grain and the like just the one thickness of canvas is sufficient. I have a good pattern and make them on the machine. Several pairs can be made in an hour, and by keeping three or four pairs on hand there is always a dry pair. I make them for the men and children and also my own work mittens, and keep clean ones for hanging out clothes on a freezing day. There are numerous other ways for using them which will suggest themselves, such as for wash cloths, for diapers, for mending lining, bands and facings. One Christmas we hemmed several 10-pound sugar sacks for sheets on the dolls' beds.

MRS. NILES GROVER.

'Obesity Cures."

WE shouldn't speak of curing obesity, however, for obesity isn't a disease except in rare instances. With the exception of the comparatively few cases in which there is some disorder of the nerves governing nutrition, an excess of bodily fat is due either to a natural habit of the body which we call a family trait or to eating more food than the needs of the body require. Some of us are born to be plump just as others are born to be brilliant, and we can no more control our little predisposition than can they, but, just as it is more creditable to be born with a big head than to acquire one, we feel relieved of some responsibility if only our ancestors were portly people. Others, quite a few others in fact, just simply eat too much. If eating were a painful process, and pie were a penance, few of us would be short of breath or wear turndown collars; incidentally, most of us would be out of a job, for supplying others with something to eat and then washing the dishes keeps the world busy. Our body engines require a certain amount of fuel, but a lot of us make the mistake of thinking that we are six-cylinder motors when we are only twins, at best. As a consequence, we pour in gasoline until our pistons become clogged with carbon and our horse power is seriously reduced. The cure for this form of obesity is less food and more active physical exertion. What! You won't take this cure? Well, I didn't think that you would; I was just telling you.

When families run to portliness a little excess of avoirdupois shouldn't worry them; it's hard to keep the beef breeds from putting their food onto the ribs. With reasonable care not to keep their appetite too thoroughly squelched they shouldn't suffer physically no matter how much they differ in form from their ideal of personal beauty. Few of us can look like the stream-line ladies in the corset advertisements and none of us want to look like the pictures of the alleged college youths who are most readily distinguished from the puppies at the other end of the string by the fact that they wear cuffs on their pants.

There are not wanting unprincipled people, however, who appreciate and would capitalize the almost universal desire of feminine hearts to retain the willowy form of youth. Men may be pillowy and content, but the mind of the fair sex upon willowness is bent. These "obesity cure" people may know well that there is no drug or combination of drugs that will safely remove surplus flesh, though there are a number that have an unearned reputation for doing this. True, there are one or two that will remove the flesh, but unless judiciously used, they will also remove the spirit. Realizing that this fact is becoming popularly known, some of these unprincipled people seek dupes by advertising drugless flesh reducers.

It matters little whether the obesity cures are drug or drugless, they are all equally worthless. Upon investigation it will be found that the "cure" consists of a laxative and perhaps some more or less inert drugs; the more dangerous ones are being left out. These are accompanied by directions for dieting and exercise that if followed would result in the loss of some flesh, but when these are discontinued the flesh returns and sometimes brings a little more with it. Few people have the hardihood to stop eating the bread, potatoes and other starchy articles of the daily diet that these directions ban or the persistence to long carry out the systematic and strenuous exercise that is enjoined. If they had they would obtain all possible benefit that the "cure" can bestow, and at no expense. The only cures that these same unprincipled people ever work are possible ones for credulity in fleshy people and leanness in their own pocket books.

M. B. D.

:: Good Things for the Holidays ::

BAKED SQUASH.—Since our grandmothers' time and the days of brick ovens the custom of baking squash whole has fallen away. Yet there is nothing more delicious and as a decorative scheme for the holiday meal it cannot be excelled. Choose either a dark green Hubbard squash, or one of the striped pumpkin colored squashes, like the Delicious or the Boston Marrow. It should weigh from five to eight pounds, according to the number to be served or the place it is expected to fill in the decorative scheme. A good way is to select one that is slightly flattened on the under side so that it will lie firmly on the platter it is to be served on. Trim the ends, wash the outside, and cut out a circular piece about four inches across on the upper side to serve as a lid. Scoop out and scrape clean the inside. If the shell is unusually hard it would be well to score the outside with a very sharp knife in lengthwise sections and once or twice around the squash in even lines, cutting only just through the outer layer and as near invisibly as possible, the pieces to be of the size desired for serving. Place in the oven in a deep covered pan with just a little water in the bottom. This is to keep the squash from drying out too much in the baking process. Bake one to two hours, as seems necessary to cook tender, allow for plenty of time as a little overtime won't hurt it. Keep the cover on and the water renewed until the last half hour. Then remove from the oven. Lift off the lid of the squash and give the whole inside a good sprinkling of salt and a dash of pepper. Then add one-half cup of butter and one cup of brown sugar. Place the lid on and return to the oven. After the butter has had time to melt mix it thoroughly with the sugar and baste the inside of the squash frequently for the next half hour with the mixture, leaving the lid off so that the inner surface can brown just a little. Serve very hot on a large platter surrounded with Christmas snowballs. The latter are made as follows:

Christmas Snowballs.—Take quarters of large tart apples, roll them well in sugar and sprinkle with cinnamon. Then fold about them in the shape of a ball cooked white rice that has been salted, and cooled somewhat. Tie the balls up in little squares of cheese cloth and steam one-half hour. These are delicious served with maple cream made of one cup maple syrup and one cup sweet whipped cream, well blended.

Apple Butter.—Another thing that should by no means be forgotten from the holiday preparations is a supply of apple butter. This can be made in advance, and is delicious for sandwiches or cake fillings, or as a sweet by itself. Contrary to popular belief, sweet or boiled cider, while very desirable as an addition, is not a necessity in making this time-honored and very wholesome appetizer. Peel and slice up three times the bulk of butter desired of tart, quick-cooking apples, free from all gnarliness or blemishes. Put about half the quantity to cook in a large granite pan or kettle, with just a little water. Cover tightly at first. When these are tender add the remaining quantity a few at a time, as it cooks down. When all are cooked in and stirred until it is a smooth, lumpless mass, add sugar and spices to taste. It is more delicate in flavor if nothing is added but a very little cinnamon. Cook slowly, stirring to prevent scorching on the bottom, until it is thick enough so that when a little is placed in a saucer the juice won't separate from the butter. Place in a jar in a cool place and this will keep a long time, if it is possible to keep it from prompt consumption because of its deliciousness.

Here are some wholesome foods to be served for suppers during holiday week or for Sunday night suppers:

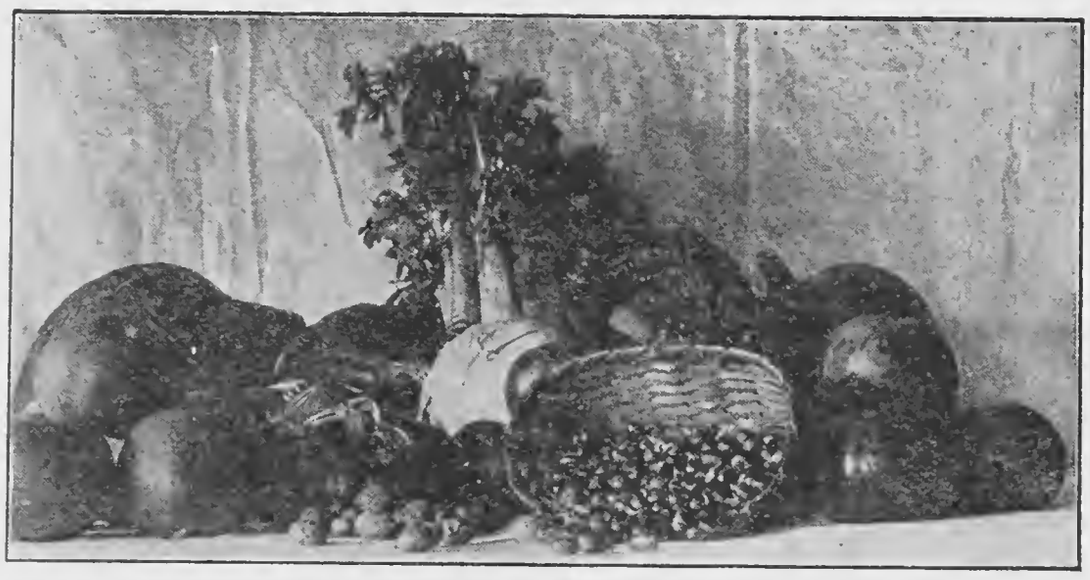
Brown Bread Sandwiches.—Cut long narrow slices of brown bread, and spread with snappy or cream cheese, with a sprinkling of nut meats. Or butter and a filling made of equal parts chopped dates and nut meats.

Cream Celery Soup.—One quart of chicken or beef stock and one quart of milk or two quarts of milk. Cook one-half cup rice in salted water and rub it through a potato masher. Wash and grate one head of celery and rub this through the masher, after cooking tender in a little milk or water. Add to the boiling hot milk, season with one teaspoon of salt, paprika and a dash of nutmeg. Serve hot with toasted croutons or diced bread.

Cabbage Salad.—A quick and delicious salad is made by slicing the cabbage very fine on a slaw cutter, and adding a dressing of equal parts prepared mustard and sweetened whipped cream.

Apple Cake.—A much liked fruit cake for the holidays is best made a week in advance—as it seems to ripen and soften by keeping. Three cups chopped apples cooked for five or ten minutes with one cup molasses. Cool and add one cup shortening, creaming thoroughly. Then add one cup buttermilk, two tablespoonfuls soda, four rather scant cups of flour, one teaspoon each, cloves, nutmeg, cinnamon, one cup raisins, or one-half cup raisins and one-half cup currants. This makes three ordinary loaves. Wrap in oiled paper for a few days. Cover with white boiled icing, or a brown sugar icing, one cup brown sugar boiled with one-half cup sweet milk, or a black chocolate icing. A sprinkling of candied caraway seeds gives it a very festive, old-timey appearance.

MRS. M. G. FEINT.



SOME GOOD THINGS FOR CHRISTMAS.

Intestinal Fat; Scrapple; Blood Pudding.

IT was with much interest we read the instructions concerning butchering as done in Illinois. From a chance conversation I overheard lately I believe all do not render the fat taken from the intestines with satisfactory results. As told on page 1361 the fat is more easily removed while the intestines are yet warm. The fat should then be placed in a kettle with enough water to cover then, a generous handful of salt added. This removes all the blood. The next morning take from this water, wash well in luke-warm water, cut in small pieces, then put with enough water to start cooking, in a kettle on the stove. Over this should be sprinkled almost a teaspoonful of soda. Cook slowly at first, then more rapidly. You will find this white and sweet smelling, but as a precaution should be put in a separate vessel from the leaf lard and used first.

SCRAPPLE.—This seems to be one of the by-products of butchering time which is not very well understood in various communities. In Lancaster County, Pa., it is considered indispensable, and it certainly is fine when made just right. The head, heart, skins from lard and sausage pieces and in fact any trimmings not used for sausage can be made use of. The meat is placed in a boiler with enough water to cover and cooked until the meat is easily separated from the bones, when it is taken from the boiler with the aid of a wire ladle, the bones are all picked out and the meat put through a chopper, put back on the fire with the liquor in which meat was boiled, previously straining this liquor and adding enough water so there are three times as much liquid as meat. After it reaches the boiling point thicken with fine cornmeal and buckwheat or wheat flour in the proportion of three cupfuls cornmeal and one of buckwheat or wheat flour. When the consistency of a rather thick mush season with salt and pepper to suit the taste; then boil, stirring constantly, for it is easily scorched, until the fat seems to rise to the top of the mass. Remove from the fire and pour in pans from which it may be cut in slices and fried like mush.

BLOOD PUDDING.—We have heard this product spoken of, but never until quite recently did I ever see or taste of it. It was made by a little Swedish woman and to me was a decided surprise. About two cupfuls of blood were caught from the hog by the butcher. Care was taken to keep whipping the blood with an egg beater, so it would not coagulate. To this was added eight cupfuls of cold water, then thickened to a very stiff dough with graham flour to which was added two level tablespoons baking powder and one of salt. This was kneaded for some time like bread dough, then pieces the size of a large cup were pinched off and dropped into a large kettle of boiling salted water and boiled like dumplings. When done they were removed from the water into a drip pan and dried slowly in an oven only warm, not real hot. To prepare for the table it was sliced in small thin pieces like dried beef, browned in a pan in which butter or drippings had been heated, when browned, milk enough to form sufficient gravy was poured over all, and the pan was placed back on the stove, where it would simmer slowly. The flour in the pudding forms the thickening. In cold weather these puddings will keep several weeks. K. C. W.

Ohio.

New and Delicious Confections.

ORANGE AND GRAPEFRUIT STRAWS.—These are perfectly delicious and cost only in time and sugar, as they are made only from the skins, which may be saved after using the inside for breakfast, as they have to be washed thoroughly and boiled in several different waters. After washing take a knife and pull off all loose inner white skin and then lay on a breadboard and cut into small pieces about an eighth of an inch wide (I generally cut the skin into quarters before I begin this part of the operation). Then put into a kettle and cover with cold water, and put on to boil; let boil about 10 or 15 minutes, then drain off the water and cover again with cold water, repeating the same process from four to six times—four times generally being enough with oranges and six times with grapefruit, unless the latter is particularly mild. At any rate, they should boil about an hour and a quarter and then be drained. Take granulated sugar and add just enough water to keep it from burning; when melted, put in half or a third of the fruit and cook from half to three-quarters of an hour, or until the white part of the fruit looks clean. After it has boiled about 10 minutes you will notice that the syrup has become very thin. This should be remedied by adding more sugar, generally twice, as the syrup needs to be thick, and at the end the syrup will thread when dropped from a spoon or fork. Have ready a soup plate (any other dish of similar depth will do) filled with granulated sugar and two forks. Take out onto a wire strainer about two tablespoonfuls at a time of the fruit, let drain a few minutes and then roll each piece in the sugar and toss on to another plate or platter. The two forks are used to turn the fruit and transfer it from one plate to another. When the first lot of fruit is finished, put the second lot into the syrup and proceed as before.

Of course if only a small quantity of fruit is fixed at a time it could all be cooked together, but I generally make four or five pounds at a time as it keeps perfectly if put in an air-tight box; and the week I make the candy I use oranges for a short cake and a couple of puddings and have the grapefruit for breakfast so as to get enough skins at one time. They will keep all right in a cold place for about a week. I have made these "straws" for some of our church candy sales and we received 40 cents a pound for them, and no matter how much I made I could always have sold more if we had had it, which shows that it is popular.

The syrup that is left after cooking the fruit can be utilized in several different ways. For instance, shredded cocoanut can be added to it, thus making another kind of candy, as the flavor of the orange or grapefruit skins with the cocoanut is delicious. After cooking the cocoanut in the syrup for about 10 minutes take from the fire and stir until stiff, when it can either be pressed into a square tin lined with paraffin paper and marked off into squares to be broken apart when cold; or dropped by spoonfuls in little mounds onto waxed paper. Or the syrup can be used in making apple sauce.

One time I used the syrup when fixing the refreshments for our club, which is a small one of 12 members. As we are limited to one thing to eat and one thing to drink there is not much to choose from unless you vary the kinds of cake or sandwiches. First I baked a sponge cake mixture in muffin tins; then I cored (with an apple corer) and peeled small apples of uniform size and carefully cooked them in the grapefruit syrup, keeping a cover on the kettle as it made them cook more quickly, so that the apples would be whole when cooked. I put them onto a platter, and set them out to get perfectly cold. In the meantime I chopped some walnut meats (hickory or other nuts would be equally good) and then just half an hour before I expected my company I put a cake on each plate and on top of that an apple, filling the center with chopped pineapple and quince preserve (any kind of jam would be equally good). Over all that I spread sweetened whipped cream and sprinkled it with the chopped nuts. On top I put a red cherry. I served hot coffee with cream with the apples and everybody said the refreshments were the most delicious they had had in a long time. Of course a plain sugar syrup could be used to cook the apples in just as well as not, but if you have the orange or grapefruit syrup it gives the apples a rather unusual flavor.

Cherries and strawberries in season are done the same way, the stems and hulls being left on, and you don't know how delicious they are until you have tried them; and some of New York's best caterers serve them on smart occasions. They charge from 60 to 80 cents a pound. A pound of fondant will generally do a little more than a pound of grapes, and of course if any fondant is left over there are numberless bonbons that can be made out of it.

And right here is a chance for the farm women in the South and West where oranges, grapefruit and Malaga grapes grow and who are near any of the large hotels or resorts to make some money. Put up in attractive boxes holding from one to five pounds, large quantities could be disposed of every week. Boxes could be made of bristol board, plain or decorated in water colors if one was handy with a brush.

It will not come amiss to give a recipe for Turkish delight, which is a most delicious confection also, inasmuch as the inside or juice of the oranges and grapefruits could be utilized in making it if so desired. Soak two heaping tablespoonfuls of gelatine in two-thirds cup cold water for five minutes; put one pound granulated sugar with two-thirds cup cold water on to boil and when it boils add the gelatine and boil slowly for 20 minutes; then add the grated rind and juice of one large orange and one lemon (there should be one-half cup of fruit juice). Wet a square tin dish and pour in the mixture to the depth of one inch. When perfectly firm dip mold in warm water, turn out onto waxed paper, cut into cubes and roll in confectioner's or powdered sugar to which a teaspoon of cornstarch has been added. Different kinds of Turkish delight can, of course, be made by using different fruit juices and different coloring matter.

Marshmallows.—All children and nearly all grown-ups like marshmallows. Take one heaping tablespoon gelatine and soak in 10 tablespoonfuls cold water; boil two cups granulated sugar with 10 tablespoonfuls of water until it threads; then add gelatine to syrup and let stand until partially cooled. Then add a pinch of salt and flavoring to taste and beat with a whip until too stiff, and then with a spoon until soft enough to settle into a sheet. Dust square pans thickly with confectioners' or powdered sugar (with a little starch added) and pour in the candy to about half an inch deep and set in a cool place until thoroughly chilled. Turn out, cut in cubes and roll in powdered sugar.

Maple Fluff.—Two cups of maple or medium brown sugar (if you only have the very dark use one cup granulated and one cup brown sugar) boiled with about half a cup of water until it just hairs, then pour onto the stiffly beaten white of one egg and continue beating until the mixture is stiff enough to mold into different shapes. It can be heaped in little mounds with a spoon or made into a rope and then cut into small pieces, etc. It is also very nice with chopped nuts added to it. MRS. BELLE BEARDSLEY.

:: The Children ::

An Energetic Little Girl.

THIS little girl, Anna Ruth Miller, is the foster daughter of one of our tenants, Mr. and Mrs. J. W. Miller, who have reason to be proud of her success in winning a fine little Shetland pony in a recent subscription contest. The pony

RUTH MILLER AND KIP.

is named "Kip" and it has not only been broken to ride and draw a buggy but it has been trained to do many interesting things. He can go up and down stairs, eat from the table with his fore feet on a chair or a box, say his prayers, etc. Mr. Miller is a born horseman and delights in spending his spare time in caring for his horses, of which he keeps from six to ten. Mrs. Miller is a lover of flowers as may be seen in the picture. They are among the best tenants that we have ever had. May the land find more of the same worthy class who are willing to beautify and adorn the homes they occupy for the express purpose of getting more of the joys of life. They live at "Bellevue Place" and would be delighted to show your readers the interesting things that "Kip" can do.

JOHN L. SHAWVER.

A Young Corn Grower.

THE little picture here given shows what a 12-year-old boy, rather small for his age, did in the School Contest in Cape May County, New Jersey. This boy received the third prize of $5 for his corn, and he is all ready for another contest next year. The fodder shows that he did a good job for his share of the contest. This boy's father, Arthur W. Sykes, is the man we have told about, who has had a varied experience in going back to the land. He went out first with his family, and in order to pay for the farm Mr. Sykes enlisted and served Uncle Sam in the Philippines for several years. There he earned money enough to square up the farm, and in the meantime his wife had been the partner on the job and

A YOUNG CORN GROWER.

carried the farm along. When he got back they were induced to sell their farm and go back to the city, but business there proved a failure, and so they went back to the land again, back to New Jersey, where they are going through the same process of working to pay for that farm and provide a home and a good property. They are doing it too, with the man to earn the cash, and his wife as active manager at home to see that the cash is properly handled and managed. This boy is going to make a corn grower, and the time will come when his variety or strain of corn will be wanted in the seed trade, because it will carry qualities which other growers need.

Three Farm Pets.

THE old fellow in the center (Robinson Crusoe) was a mongrel Barred Rock. The dignified cock-of-the-walk air shown in the picture was acquired in his later years, considerable of the first two years of his farmyard life having been spent in dodging a White Leghorn enemy. Whenever the Barred Rock attempted to crow in sight of his enemy the latter came on a dead run, and the last bar or two of the crow was mutilated. Occasionally he stole around in the front yard, where the other fowls were not allowed, and crowed six or seven times in solitude. In the third year his enemy departed and then Robinson's "palmy days" began. He crowed whenever he pleased, was fed pieces of bread, cake or other knicknacks and developed a philosophy of life near human, as he ate the choice bit himself, and called the hens only when something of which he had doubts—like white beans—was offered.

The White Leghorn hen at the right attracted attention when half-grown by her persistent habit of singing. Throw her a bit of bread or kernel of corn, and as soon as it was swallowed she would sing. An attempt to reach her affections by the victuals route was very successful, as it is with the most of us, and the writer made it a point always to have something good in his pocket. The hen

THREE OLD FRIENDS ON THE FARM.

quickly learned and finally would fly on the feeder's shoulder, riding all about the yard singing so loudly that it attracted the neighbors' attention.

The cat at the left had the usual experience of farm cats, being buried in the haymow, falling into a pitchfork and in other ways losing several of his nine lives, until middle age, when he settled down to a pampered existence. A boarder at the farm, who ate supper alone, developed the bad habit of feeding the cat morsels of meat when in the dining room. The cat soon made the mental connection between the food and supper bell, and raised his voice vigorously if not let in as soon as the bell was rung. He was terribly afraid of thunder and at the first grumble howled dismally and went for the cellar, where he hid behind the furnace until it was over. W. H.

Smart Sayings.

TWO-YEAR-OLD Charlie and his mother were spending the afternoon in the yard. Charlie had been running about in some tall Orchard grass, and came back to his mother when she asked: "Well dear, did you find any kisses for mother?" Charlie answered: "No mamma dere weren't any in blossum, dey was just in bud."

Four-year-old Mabel sat looking intently at her grandpa who is bald and wears a long beard, then burst out with: "Why Grandpa the hair all growed on the wrong place."

Little Gladys' daddy believes in spankings and spankings that give no uncertain sensation—hence Gladys does not care to have her misdemeanors reported to him. One day she shut up the cat in the oven, being one of that kind of children who simply must be doing something. Luckily for the cat, the fire was out, but the oven still warm, so that when Gladys' mother, hearing a scratching sound, took the cat out, it was quite limp. Gladys thinking the cat dead, with mingled emotions of grief for the cat and apprehensions of punishment for herself wailed: "Oh mamma, will Kittie go to Heaven?" Not wishing to hurt the child's feelings her mother said, "Yes, I think so." "Will papa go to Heaven?" "Yes, I think he will too." "Oh mamma, then don't let Snippers (the cat) go, don't. Dig a big hole and put her in it."

Another time her mother wished her to pick up the baby's playthings for him which he had thrown on the floor. Knowing that the little girl was getting tired of the oft-repeated task, she suggested that she play Santa Claus and give the playthings to the baby for presents. Gladys looked at her mother and said: "Say mother, don't you think you are scheming a little?"

GRANGER No. 1.: "Do they have the R. F. D. on your end of the State road?" Granger No. 2: "No, we have the B. R. D." G. No. 1: "What's the B. R. D.? Never seem to have heard of it." G. No. 2: "Why, that's Box Rent Due."

W. W. A.

Knitting for the Soldiers.

What do women knit for the soldiers abroad and how and where do they send finished articles. G. D. P.

The women knit mufflers, hospital stockings, wristers and men's socks. The directions given are endorsed by the Red Cross Society. Articles could be sent to the Red Cross, the Lend a Hand Society or other distributing agencies. The muffler is knit in garter stitch in gray or brown, takes one and a half skeins of Scotch yarn and is done on No. 6 needles. It should be 10 inches wide and four feet long, cast on 45 stitches. An easy hospital stocking is made on No. 4 bone needles, one skein of Scotch yarn will make a pair. Cast on 60 stitches, knit two stitches, seamed two stitches, all across row. Repeat for 17 inches long. Then knit one row, seam one row, knit one row, seam one row. Knit one row, narrow (by knitting two stitches together) every fifth stitch. Seam one row, knit one row, seam one row. Knit one row, narrow every fourth stitch. Seam one row, knit one row, seam one row. Knit one row, narrow every third stitch. Seam one row. Knit one row, narrow every second stitch. Seam one row. Knit one row, narrow every second stitch. Then bind off and sew up with worsted. There is a drop stitch style made on four No. 12 steel needles, also. The directions for men's socks are too long to give here, but will be sent you by mail if you like. Children help by making crutch pads 4x5 inches, rounded at the corners and padded until ¾-inch thick with the inner piece slightly smaller than the outer piece. Turn in the edges and stitch firmly and attach two six-inch tapes on each of the longer edges.

"Now suppose, children, one of your schoolmates should strike you, and the next day you should bring him an apple, that would be one way of returning good for evil," said the Sunday school teacher. A little girl raised her hand. "Well, Elizabeth," said the teacher, "what is it?" "Then," said Elizabeth firmly, "he would strike you again to get another apple." —Ladies' Home Journal.

Black Wall Map of the World
The World and the United States At A Glance
A Great Education
At Your Fingers' Tips

This beautiful Wall Map, size 25x39 inches. On one side we have a complete, up-to-the-minute map of the United States in bright colors, showing the Capitols, Railroads, Rivers, large cities, etc. It also shows portraits of our 27 Presidents, and gives their biographies.

On the reverse side we have a map of the world, printed in a deep, ebony black. White and colored lines differentiate countries, rivers, lakes, cities and mountains. You never saw a map as black, as beautiful, as wonderfully enlightening as this map of the world. From this you may in a single day learn more than you could in a year's study of books.

Contrasting with the ebony black of the map are the flags and the coat-of-arms of all nations, in their flashy, exquisite colors. Our own seventeen flags are here in beautiful, bright colors—did you know that the United States had seventeen different flags?

And then, there's that wonderful Bible information. How many books, chapters, verses, words, letters does the Bible contain? How many books are classified as History, Poetry, Law, Prophecy, Epistles? Which books are exactly alike? How many times is the name of our Saviour mentioned? In how many languages is our Bible published?

Wouldn't you want to know these things? And wouldn't you want to know the many, many other things this marvelous Map of Knowledge possesses?

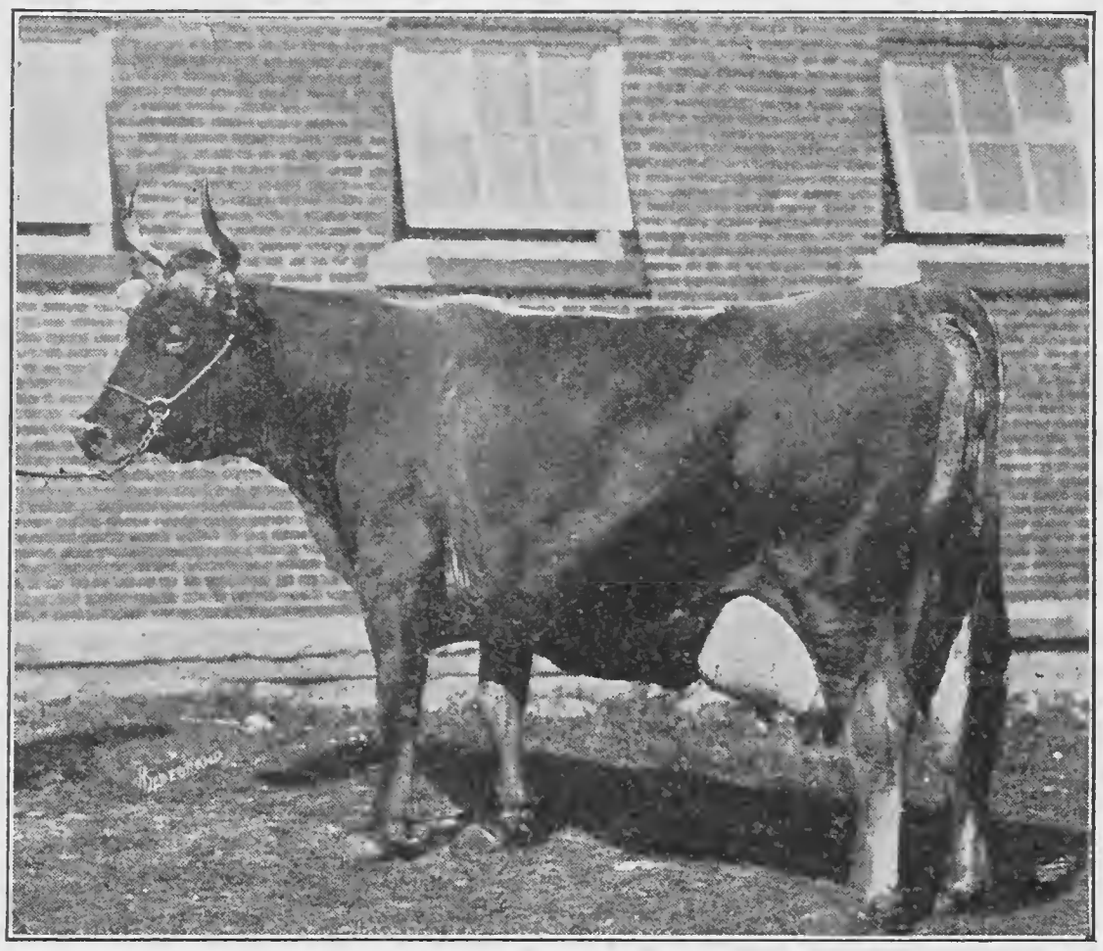
The Map will be sent, postpaid, for One New Yearly Subscription, or Twenty 10-Week Trial Subscriptions, or Two Yearly Renewal Subscriptions.
The Rural New-Yorker, 333 West 30th St., N. Y.

Live Stock and Dairy

SHALL I SELL MILK, BUTTER OR CREAM?

AN ECONOMIC QUESTION.—A farmer writes to a certain farm paper as follows: "I have 28 high-grade Holstein cows. For the month of August they gave me 12,069 pounds milk, which I sold at $1.88 per hundred pounds. If I could get nearly as much by making butter or selling cream I would much rather do that, so that I may have the skim-milk for pigs. The milk averages 3.8 per cent. butterfat." This farmer is beginning to see daylight. The more of such inquiries received and properly answered by farm papers and agricultural colleges the better off the dairy industry will be.

CO-OPERATIVE CREAMERIES.—It would seem that one factor which will help materially to raise the price of wholesale milk in Connecticut is the establishment of co-operative creameries and skimming stations. This would so decrease the supply of milk that the contractors and presumably the consumers would have to pay more for it if a surplus was maintained and the demand supplied. The fact that there does not begin to be high-class butter enough made in the State to supply



CHAMPION BROWN SWISS COW ARLENE, 2769.

the demand, together with the fact that a large amount of the cream used in our rapidly-growing ice cream business comes from outside the State, warrants the establishment of more good creameries and skimming stations. While it is probably true that the cow population of the State is not large enough, or, at least, so distributed that the desirable amount of creamery business could be done if a large per cent. of the wholesale milk sold in the State could be turned into the creamery weigh can and cream vat, conditions would be greatly improved.

MILK, BUTTER OR CREAM.—Let us suppose the farmer referred to above is located in Connecticut at such a distance from a city as to make the retailing of his milk impossible, but within a reasonable distance of a good creamery. Let us also suppose that regardless of the number of cows kept, he has 10,000 pounds of 3.8 per cent. milk monthly. The farmer really has his choice of selling wholesale milk, making butter on the farm, taking his cream to the creamery where it may be made into butter or ice cream, or sold by the creamery to the ice cream manufacturer. The 10,000 pounds of milk produced monthly equals 4,651 quarts. This would be a production of 120,000 pounds or 55,812 quarts in one year. The average prices paid by the two leading contractors buying milk in the State from April, 1914, to April, 1915, are 3.94 cents and 3.76 cents per quart, or an average for the two of 3.85 cents. In selling his milk the farmer receives in one year $2,148.76.

SKIM-MILK OR BUTTERMILK.—If he skimmed a 35 per cent. cream from his milk he would get 13,028.6 pounds of cream, containing 4,560 pounds fat, which should make, with 18 per cent. overrun, 5,380.8 pounds butter. If he makes this butter on the farm, he will have, in addition to 106,971.4 pounds of skim-milk, 7,647.8 pounds of buttermilk for feeding various classes of live stock. For pig-feeding alone it is generally conceded that 100 pounds of skim-milk or buttermilk is equal in value to a half-bushel of corn. At our present prices of corn 100 pounds of skim-milk or buttermilk must be worth at least 50 cents per hundred. At this price the skim-milk would be worth $534.80, and buttermilk $38.24, making a total of $573.09. He should receive 38 cents a pound for his butter. Allowing three cents per pound for making his receipts from butter would be $1,883.28. This, added to the value of his buttermilk and skim-milk, would give him an income of $2,456.37.

VALUE OF SKIM-MILK.—Every 1,000 pounds of skim-milk contains five pounds nitrogen, 21 pounds phosphoric acid, and two pounds potash, and every 1,000 pounds of buttermilk contains 6.4, 1.7 and 1.6 pounds, respectively of the fertilizing constituents mentioned. In the skim-milk left on the farm there would be 534.8 pounds nitrogen, 224.6 pounds phosphoric acid, and 213.9 pounds potash, all worth, with nitrogen at 20 cents per pound, and phosphoric acid and potash at five cents per pound, $128.89. Since 70 per cent. of the fertilizing value of the skim-milk is recovered in the manure there would be an added income to the farm of $90.22 from the skim-milk. Similarly the buttermilk containing 48.9 pounds nitrogen, 13 pounds phosphoric acid and 12.2 pounds potash, would net the farmer $7.72. Instead of crediting the farmer with this let it go to defray the expense of separator, buttermaking equipment, and possible losses in skimming and churning. Even then the farmer is $307.61 better off making butter than selling milk.

SELLING CREAM.—Since the farmer is located near a creamery he would probably prefer to take his cream to the creamery rather than make it into butter on the farm. If he does this and receives an average price of 36 cents per pound for butter fat, his 4,560 pounds of fat will give him $1,641.60. Thirty-six cents was below the average price paid by some Connecticut creameries last year. He has the skim-milk, but no buttermilk at home on the farm. The skim-milk is found to be worth for feeding $534.85. This added to $1,641.60 equals $2,176.45, or a balance of $27.39 more than the receipts by selling milk. (Right here it may be said that if he only skimmed a 25 per cent. cream, instead of the 35 per cent. cream, he would have 5,212 pounds less skim-milk left on the farm, which would mean a loss of $26.06, not to mention the extra cost of handling and delivering 5,212 pounds more cream.) The value of the fertilizing constituents in the skim-milk will again be left out of consideration.

"POINTS" ON CREAM.—If the farmer takes his cream to the creamery or possibly he may haul his milk to a skimming station near by, and the cream is

RAW OR COOKED

THE HEESEN STOCK FEED COOKER

Most of the food you eat is cooked—why—because **cooking is partial digestion.** When you want to fatten, condition or improve animals—the stock on your farm—you must do the same thing—feed food that will quickly digest or is partly digested and **free of germs.**

Cooking Kills All Germs

Cooking kills all germs, prevents **hog cholera, and** all such diseases in animals. The cooker for this work is the **HEESEN**—which, because of its peculiar construction, is quicker—stronger—and better. Has the largest fire door—indestructible cast iron kettle—in a cold-rolled steel jacket, both of which will last forever. It is adapted to **burn either wood or coal,** and the price is about one-half that of cookers which are **actually** of equal capacity.

This cooker made us famous—Thousands in use and we have testimonial after testimonial from prominent users.

Write for our **Free Booklet "The Undigested Toxins"** telling how to feed to avoid disease—worth money to you.

46

used for making iee eream or sold by the plant for that purpose, the farmer should receive elose to one eent a "point" for his eream, or 35 eents per quart for a 35 per eent. eream. If this was the case, and it eould be sold this way, the year round, whieh might be possible in some eases. the farmer would receive for his 13,028.6 pounds or 6.418 quarts of 35 per eent. eream $2,246.30. The value of the skim-milk, $534.85, added to $2,246.30, makes a grand total of $2,781.15, or $632.39 more than receipts for whole milk. This latter method shows what a neat profit there is in selling eream for iee eream purposes. Of course cream produeed for any purpose must be of good quality to demand top priees. However, when milk is sold wholesale sanitary conditions must be so good that with proper eare the eream is bound to be good. There is a tremendous eall for good eream in this State at the present time.

COMPARISON OF VALUE.—In summing up the reeeipts of our farmer in selling his produet in the different ways mentioned we get the following:

Selling wholesale milk.....	$2,148.76
Selling butter	2,456.37
Selling eream for buttermaking	2,176.45
Selling eream for iee eream making	2,781.15

Another interesting feature is summed up as follows:

Value of fertilizing constituents sold from farm if 70 per cent. are available in the manure.

In selling milk	$112.56
In selling eream	22.34
In selling butter	0.17

FERTILIZER VALUES.—It can be seen that $90.22 worth of fertilizer are kept on the farm when eream is sold, as against none when milk is sold. In selling butter this sum is inereased to $112.32, certainly a good-sized fertilizer bill. This amount of fertilizer added to the farm each year will aeeomplish wonders in giving the farm a fine appearanee by keeping the soil in good condition. The other deeided advantage of selling eream or butter is that one has an abundanee of skim-milk on the farm. This with a good purebred sire should make a man dependent on nobody for good milk and butterfat produeing animals. H. F. J.

AMERICA FOR PERCHERONS.

THE outbreak of the European War, which shut off all importations, according to Secretary Wayne Dinsmore, of the Pereheron Society of America, has undoubtedly oeeasioned the dropping off of registrations. Fall importations being stopped, what otherwise would have been the greatest year in this respeet suffered a deeline of from 9,754 to 9,364 registrations, the year ending with Oetober 31, 1914, compared with the preeeding one. Mr. Dinsmore at the recent Chicago meeting of the Society, called attention to the substantial increase in American-bred stallions and mares. A year ago Indiana stood tenth in the number of mares and stallions purchased, and in this short time she took third plaee in the number of animals purchased, due to efforts of the Indiana Stallion Board, whieh has been active in weeding out grade and unsound animals.

President White, of the Percheron Society, said in part: "Exeept the Percheron alone, the Belgian is the most popular draft horse in America, and with the exception of Belgian studs in Ameriea the raee is almost eliminated. Franee has already prohibited for at least five years the exportation of mares of any breed. We have to-day in this country not less than 100,000 purebred Pereherons, worth approximately $50,000,000. Besides having before us the entire American market it is more than probable that we shall have to supply breeding stock to Canada and Argentina, countries in which Percheron popularity is increasing by leaps and bounds, and even reinvigorate and replenish Freneh stock. We added 880 members during the past year, making our total membership 6,420, and we are now the largest and strongest horse breeding organization in the world. It was found necessary to charge our members a fee for transfers, the entire eessation of imports, a source from which we derived $25,000 annually, having been eut off."

The following officers were re-elected: E. B. White, president; W. S. Corsa, vice-president; C. M. Jones, treasurer; Wayne Dinsmore, secretary. The retiring directors were E. B. White, Leesburg, Va.; C. M. Jones, Plain City, Ohio, and J. M. MeLaughlin, of Dickerson, Md. Nominees brought before the annual meeting were E. B. White, C. M. Jones and A. L. Robison, Jr.

Dishorning Twice; Inbreeding Turkeys.

IS there any danger in eutting a cow's horns off the second time? 2. Can you feed a pig eight weeks old too much corn? 3. Would it do to mate a young gobbler with parent stock? Would it make the young turkeys inferior?

New York. S. L. B.

1. There is no speeial danger in the second operation, provided the docking shears are sharp and disinfeeted. Where second dishorning is necessary the cutting has been done too far from the head at the first operation. 2. Any pig can be fed too much eorn, and overfeeding with eorn is a very common cause of sickness among hogs. An eight-week-old pig should not have a large amount of eorn, but may have cornmeal as a part ration in slop with other meals. New eorn should be fed very sparingly at first, and form but a small part of the ration. Fed otherwise it often kills young pigs. 3. One in-cross may do no harm, but turkeys nowadays are so prone to weakness and disease that it is best, on general prineiples, to mate the hens with a strong, non-akin gobbler. A. S. A.

Ration for Horses.

I AM obliged to buy all feed for four farm horses for two months and more, and it is a very serious item. Would you give a proper ration for horses where feed is bought. I am now feeding a mixture of hominy and bran, half and half, in addition to Alfalfa. I wanted this last for my cattle but can get at no other hay at present.

Pennsylvania. G. W. S.

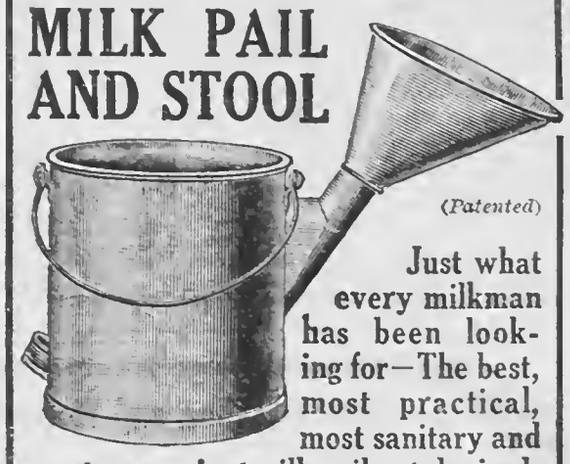
To preseribe an ideal ration for horses one would have to know their age, condition and the amount of work that they are doing. The universally used grains that seem to fit about all conditions are oats and corn, and if these are available they will probably prove as satisfaetory as anything that you can purchase. Ground together in equal parts, they may be fed in quantity proportioned to the work that the horses are doing. The average farm horse doing ordinary work will keep in good condition on 12 quarts daily of corn and oat chop, but if the work is hard, like continuous plowing, more grain will be needed. There has been considerable prejudice against Alfalfa hay for horses. It is laxative and horses eating it exerete more urine than those on hay from native grasses. There seems to be no evidence, however, that these effects are at all injurious, and various experiment stations, as well as private owners, report exeellent results from Alfalfa hay fed to work horses and eommend its use. M. B. D.

Catching a Hog.

ON page 1225, regarding balky horse, A. S. A. advises W. E. P. to throw him with side lines and "hog-tie" him. Will you explain this hog-tie method? Are all four feet tied together or how does he do it? 2. How would you go to work to snare a hog to eatch him? Is small rope or wire used? C. H. F.

1. By the term "hog-tie" is meant bringing the four feet together and tying them there. The horse is thrown; then the feet are lunched and tied by means of buckling straps. 2. A double hinged hurdle is used to pen the hog into a corner, then a noose of wire or small rope is put around the upper jaw. Medicine may be administered by means of bottle having a bit of strong rubber hose slipped onto the neck; this is thrust into the mouth and the medicine poured in. Another plan is to eut a hole in an old shoe, stick that in the mouth and allow the hog to ehew, then pour the medicine into the shoe. A. S. A.

ALEXANDER'S
COMBINATION SANITARY MILK PAIL AND STOOL



(*Patented*)

Just what every milkman has been looking for—The best, most practical, most sanitary and most convenient milk pail yet devised.

Keeps milk absolutely free from flies, dirt, dust and stable odors, yet it is simple and easily cleansed.

Pail is entirely closed and milk is strained as it passes from funnel into pail. Indispensable where one or more cows are kept. Write today for free catalog and full information.

Purebred Registered
HOLSTEIN CATTLE

In a bulletin published by the Minnesota Experiment Station, Professor Thomas P. Cooper estimates that a cow that produces only 4,000 pounds of milk per year will cause her owner a loss of $116 during her lifetime.

He figures that a 5,000-pound cow is worth $25; a 6,000-pound cow is worth $67; an 8,000-pound cow is worth $150, and a 10,000-pound cow is worth $230.

Find out what your cows are worth. Find out what purebred registered Holsteins are doing.

THE OHIO "CORN BOYS."

Their Visit to New York.

PART I.

[We have told our readers about the great army of boys and girls from Ohio who started out to see the wonders of the Atlantic Coast. These young people had won prizes at growing corn and other crops, and Ohio saw that they had their reward.]

THE PARENTS' VIEW.—Bankers opened their purses, business men offered awards and subscriptions were secured in the neighborhood, enabling 350 boys and girls to make the trip without paying a penny from their own purses. Four hundred more boys raised good corn, sold it to father and from the proceeds paid for the trip. Their fathers paid them well for their effort, and these boys were as proud as the ones who had won prizes. "Our boys and girls will see the city, and they will want to return," the Buckeye farmers said regarding the first corn trip. Secretary Sandles and T. P. Riddle had much of this kind of opposition to face. Some farmers even told the boys they could not spare them from the farms for a week, because there were so many night and morning chores to do. Little of this talk came to the surface this year.

CITY VERSUS FARM.—Of nearly 800 boys and girls on the trip only two were attracted by the glamor and tinsel of the cities. "Would you like to live in Washington, New York or Philadelphia?" was the question asked boy after boy and girl after girl on the trip. The question was put squarely to the older people on the excursion. With the exception of two boys who did not like to milk, and who had automobile ambitions, all said: "No city for me, give me the good old country. I want to get back home, I'm tired. I want to see father and mother, I want to see baby brother," the boys said. I dropped in with the Ohio boys Friday in New York. The boys were bewildered by the mysterious grandeur of New York. As Prof. Harbourt pinned the Buckeye badge to my coat, it brought good luck the whole day long. I caught the spirit of the boys as we walked up Fifth Avenue.

SIGHTS OF THE CITY.—The Bronx was perhaps most interesting. "How old is that buffalo?" the boys shouted as they passed one particularly aged specimen. "He's older than the rocks in the Bronx," the others replied. A grizzly stood on his hind feet with paws on the iron grating and gazed at the Ohio corn growers. The boys and girls gave popcorn to the elephants and they made up faces at an ugly lion. "Forty minutes, I wish I had a week here," the boys said. An hour later the Ohio corn growers were grouped before the City Hall. Mayor Mitchel told them the great city was interested in their corn production, and Ex-Mayor Seth Low said 25,000 people from the Buckeye State lived in New York, and from Ohio comes the stuff that wins. Many boys and girls had tired necks and weary eyes as they looked to the top of the Woolworth Building. Many of these thought the silo at the side of the barn had invaded the sky close to the dead line. All were surprised at attention received on Broadway, where traffic was stopped in respect and to protect the corn boys of Ohio. The trip up the East River, under the old Brooklyn Bridge, the Manhattan and Harlem Bridge, down to the Bay, up the Hudson past Grant's tomb, and the great ocean steamers were sights not to be forgotten by the boys.

"How did the boys act at the tomb of Washington?" was asked Colonel Harbourt. "They took off their hats, and stood in deep reverence," he said. "The boys showed respect for all sacred places, they were quiet, cordial and attentive in the presence of the President, of the Secretary of State, and the old Liberty Bell of Philadelphia produced a profound impression. The Secretary of Agriculture came out and talked to the boys and told them we needed greater production; the population increased by many millions while production stood still.

TIRED SIGHTSEERS.—As night came in New York, the boys and girls were tired. "I do not want to live in the city, I would not come to the city," the boys agreed. "I have seen enough of it. I would rather take the trip than spend a week at the agricultural college; I have seen so much that I am tired. Now I know nothing better than the old home, and two or three good night's sleep," they said. I asked several under whose direction the boys were placed, what the results would be in keeping the boys on the farm. They said: "When boys go to the city, it is because they know nothing of it. They are thoroughly tired of it and the impression will remain throughout their lives.

"I want to get back and see my Shorthorn steers and my pigs," one boy said, as he marched with the crowd from the Hippodrome to the great Pennsylvania station. "I enjoyed the trip, but the farm and the agricultural college for me. I used to think that I wanted to go to the city, but no more for me." One girl said she would rather have gone to the agricultural college this year, than make the trip. This girl is Miss Susan Everett, champion apple girl of Ohio. Miss Everett has been hired to assume the management of an orchard a hundred miles from her home. This she will do the coming Summer after she completes her high school course. Miss Everett said: "I didn't know anything about fruit growing until Professor Harbourt came to our school. We had a two-acre orchard and the trees were in frightful shape. I secured bulletins, and read about fruit growing. Papa questioned my ideas a little bit, but now he comes to me and asks me everything. I would rather stay right on the farm and tend to the little orchard than to live in the city, and we want to know more about apples and fruit." W. J.

AILING ANIMALS.

Lameness.

I HAVE a horse 11 years old, whose right foreleg is somewhat weak. When standing in the barn he keeps it stretched out most of the time, but while working nothing seems to be the matter. He has plenty of exercise; his feed consists of corn and he has oats and bran occasionally for a change. Has salt before him all the time. Can you tell me what the matter is and a remedy?

New Jersey. C. S.

As the horse "points" the foot when at rest you may be sure that the lameness is located there. As the lameness disappears when the horse exercises the trouble may be navicular disease, or the horse may have corns. Without making an examination we cannot make sure what is wrong, but if corns are not found present we should clip the hair from the hoof-head and blister several times at intervals of two or three weeks. Use a mixture of one part of powdered cantharides and three parts of lard as a blister. Rub it in for 15 minutes by the watch and then tie the horse up short so he will not be able to bite or rub the blistered surface. Wash the blister off in three days and then apply a little lard daily. The blister will not injure the hand. If corns are causing the discomfort have them pared down and the walls lowered at the heels so that they will not come in contact with the shoes. Then put on bar shoes and if possible let the horse run on wet pasture. Blistering the hoof-head, as already suggested, helps in chronic cases, to stimulate growth of new sound hoofs with better spread heels.

Weak Cow.

I HAVE a cow that is five years old; she freshened nearly 11 weeks ago, and to all appearances did well until about five weeks ago when one night I found her lying down. She made two or three efforts to get up, but she acted as though she was stiff and did not want to move. A veterinary pronounced it rheumatism, and left medicine for her which I gave as he directed, but she kept getting worse; could hardly get up. A third veterinarian said she had partial paralysis; he prescribed for her, and I have been using his medicine for more than a week. The cow seems a trifle better. She has at times a discharge from her nose of a white slimy appearing stuff. She is growing poor and is gradually drying up. What is your opinion of the case?

Ohio. E. H.

The first thought in such a case should be tuberculosis and the cow should be tested with tuberculin as soon as the weather is moderately cool. The test cannot be properly applied in very hot weather. Meanwhile do not use the milk. We cannot confidently prescribe treatment without making an examination, but if the cow proves to be free of tuberculosis it would be well to give fluid extract of nux vomica in increasing doses. Iron and quinine also would be indicated as tonics. Your veterinarian will supervise such treatment, if she does not react to tuberculin.

Harness Sore.

I HAVE a horse about 18 to 20 years old, good old skate, but with one bad fault. He is used for light loads, not exceeding four miles per day, and even with padded harness develops sores, evidently due to the harness chafing. These sores are slow to heal, and lay old Tom up for weeks more on account of their ugly looks than anything else. What can you recommend in the way of treatment of this evidently tender-skinned animal? F. M.

New York.

The old horse will be likely to renew his youth and regain a sound, plump skin if you feed a quart of blackstrap molasses night and morning, diluted with three quarts of hot water and then stirred up with cornmeal, wheat bran and cut hay. Feed whole oats at noon and long hay at night. Have his teeth attended to by a veterinarian to start the treatment. Toughen the skin by bathing night and morning with strong white oak bark tea, or strong alum water, or a solution of half an ounce of tannic acid to the half gallon of water. Keep harness clean and dry. A. S. A.

A NEW JERSEY Senator tells of a farmhand who philosophizes. One morning the Senator came upon this man feeding the chickens. Alexander stopped him with: "Good mawnin', sah! I been thinkin' this mawnin', and I made up my mind, suh, as I's lookin' at these heah chickens, that they's the usefullest animal they is. You c'n eat 'em 'fo' they's bo'n, and aftah they's daid!"—Washington Star.

THE NEW ENGLAND MILK SITUATION.

CIRCUMSTANCES seem to be against improvement in the New England milk situation. The Winter proce offered was not what it should have been, and leaves no profit above cost of feed and labor. The general complaint is: "My cows are not doing well. I am feeding heavy, but don't seem to get the milk. What is the reason?" Many good experienced milk producers are asking this question, but no one seems to be able to answer. It certainly is a fact that in this section at least I never saw so little milk coming from all the dairies as at present, and as far as I know this is a general complaint. Just about half of the normal supply is going to Boston at present time from this section. Local retail dealers are below their supply and buying or trying to buy enough extra milk to supply their trade. I had three apply to me in one day to let them have milk and they wanted it for quite a spell; in fact, could not tell how long they might need it, some thought all Winter. In fact the local dealers are suffering much more than the Boston buyers, as the latter can get all they need from their up-country territory, but the local man cannot do that. He must depend on what he can pick up in the neighborhood from small places that do not make a business of milk selling, but keep from one to three cows or so for their own use and make a little butter with their surplus when they have it. In the larger towns within reach of Boston those dealers can in some cases obtain a few cans from the big Boston dealers if they will take the same amount daily, but the Boston dealer seldom does this as an accommodation, but rather to get control of all the market he can, and finally force the retailer to buy his whole supply from him or sell the business to him, whichever way it works out best.

The quarantine ordered by the State Cattle Commissioner, which forbids any movement of cattle without permission on account of the prevalence of the foot and mouth disease, has helped very largely in bringing about the present conditions. Many producers at this season buy one or more fresh cows to keep up their normal supply or increase it as the highest price for wholesale milk of all the year now prevails; that is for the months of November and December about two cents per can above the average season price is paid. This will be balanced later, however, by taking two cents from February and March milk, when the supply usually is much larger than the present months. If the quarantine continues all Winter, and no fresh cows can be bought, it will result in hardship indeed to many producers, who will suffer a loss, which will be difficult to regain. The large producers usually plan to make the most milk in the Winter months and try to have their cows freshen in the early Fall or Winter. These plans do not always work out, however, and many cows have a habit of not coming fresh until mid-Winter, and thus throw our plans out of line. The only remedy in these cases is to go out and buy, but at this time even this remedy is shut off. Up to the present time there have been killed in this State by the Cattle Commission's orders 424 cows, two oxen, 104 swine and 1,267 poultry, also a few sheep and goats. All cattle killed are buried with quicklime to destroy the carcass and germs also. Apparently the spread is now checked, and all known infected sources cleaned up and disinfected. If this proves to be true perhaps the situation may improve in a few weeks, and things assume their normal run. I am very sorry to see so much opposition and indifference to organizing with and assisting the New England Milk Producers' Association to build up a good strong organization. Too many are selfish enough to say, "It does not or will not help me personally. Why should I join unless I shall get some benefit?" The truth is some benefit must accrue to all who assist or join. If this does not show at once it will later, in many little ways, which may not be much in each instance, but really amount to much when summed up. Especially may this be true in forming or improving our laws covering this milk producing question and other lines pertaining to the milk industry. When you help your neighbor to get a better price or get better treatment you help yourself, and help place him where he can later perhaps assist you, and no one can tell the time when he may need some help or a good word spoken for him. Even if one can see no direct benefit at present coming to him by assisting and joining this or a like organization, if he knows it will greatly assist his neighbors he should be willing to take this action for their benefit, but few seem to see it this way. Another point: many expect too much. If they pay a dollar or two to join and then do not get a rise in price right away or during the season, they jump to the conclusion that the officers are not doing all they can, or perhaps they think they are doing nothing at all, or are pocketing the dues paid in or something else just as foolish, when this is not true at all, but these officers are doing the best they can under the circumstances, and they are usually in the position to see things about as they are. Also they must work for the benefit of all, not for each individual. It is team work that counts every time. United we stand, divided we fall, is as true here as anywhere else! A. E. P.

CATTLE showing tendency to beefiness are expensive butter fat producers. There are cows in every grade herd and even among purebreds which evidence the tendency to lay fat on the back rather than deliver it in the pail. The Minnesota Station has computed the cost of production in relation to type. A beef type cow produced a pound of butterfat at the expense of 17½ cents, another cow with less tendency to lay on flesh produced fat at the cost of 15.1 cents, another spare angular cow, but lacking depth of body, produced butterfat at the expense of 14.8 cents, while a fourth cow, a representative of the dairy type, reduced the cost of production to 12.1 cents.

SOME DAY YOU WILL READ

The Breeder's Gazette

YOU MAY BE READY FOR IT NOW

FOR TEN CENTS YOU GAN GET THE BIG HOLIDAY EDITION FOR 1914. For $1 you can get that big double number and 51 regular issues besides. Only you must do it NOW. These prices apply only to points within the United States. Holiday number to Ganada 15c., the year's subscription, $2. The holiday cover is a reproduction in colors of a recent work by a Paris sculptor showing a "diligence"—French stage-coach of the olden days—ploughing along through the show. The five horses in action are of the true Percheron diligence type popular in France before the era of railways. How is this for a "menu"—the Holiday Number feast?

"NATURE'S 'GREAT WHITE WAY,'" by W. L. Nelson, is the opening feature this year. The snowy illustrations by which it is accompanied are of exceptional beauty, and the composition itself will appeal to all who subscribe to the proposition that "God made the country and man made the town."

"THE WORLD'S MEAT SUPPLY, PRESENT AND PROSPECTIVE," by Thomas E. Wilson, who succeeded the late Edward Morris as president of Morris & Co., the great Chicago packers, writes upon a subject of wide public interest at the present time.

"BEEF-MAKING IN THE OLD DOMINION," by Hon. Henry C. Stuart, Governor of Virginia, illustrated with photographs furnished by the writer, is an interesting recital based upon a long and successful experience on the part of the present chief executive of his native state with making beef on corn and bluegrass in the western highlands of the state of Virginia.

"A TARDY RECOGNITION OF THE WORK OF A GREAT PIONEER," by Alvin H. Sanders, is the first installment of a short series of articles in which will be told for the first time the interesting story of Col. Lewis Sanders of Grass Hills, Ky., the first importer of cattle from Europe into the Mississippi Valley, and the founder of live stock competitions this side the Alleghany Mountains. The celebrated importation of 1817 made by Lewis Sanders played a prominent part in laying the foundations of cattle feeding in Ohio, Kentucky, Indiana and Illinois; but until Mr. Sanders fortunately uncovered a store of old letters, books and documents, setting forth the life and character of this great pioneer, history has been silent as to his personality and work.

"THE EFFECT OF THE GREAT WAR UPON FRENCH AND BELGIAN DRAFT HORSE BREEDING," by John Ashton, Continental European correspondent of "The Gazette," and at present attached to the Red Cross service of the French army, gives the results of recent interviews with the leading breeders of the Percheron district in France and with the Belgian Minister of Agriculture. Mr. Ashton secured leave of absence from his post of duty in order to obtain this valuable information.

"LIVE STOCK PICTURES OF THE OLD TIMES," contributed by the noted English animal photographer, G. H. Parsons, carries reproductions of some of the most remarkable existing cattle prints handed down from the preceding generations. Mr. Parsons possesses mezzotint engravings of the original paintings, which were by famous artists, and these he has photographed for reproduction in the Holiday "Gazette." They are quaint, and possess genuine historical value.

"THE STORY OF WHITEHALL SULTAN," by Frank W. Harding, deals with the career of the most noted Shorthorn breeding bull of recent times in the United States. His blood is so widely disseminated that this article has a peculiar value to many people.

"THE MAKING OF A CATTLE BUYER," by Eli Pfaelzer of the Chicago Union Stock Yards, relates to the training essential to success in this calling in the great central markets. Mr. Pfaelzer has grown up in the business himself, and knows whereof he speaks. The article carries an interesting photograph of P. D. Armour III, who has recently become attached to the Armour forces at the Chicago yards, and commenced his education at the bottom of the ladder, learning the buying side of the business in daily contact with the traders in this market.

"A WOMAN'S WAY WITH SHEEP," by Lois McFadden, is interesting not only because it relates the practical experience of a woman in feeding for competition at the International Exposition but because of its interesting observations on the subject of what the women of the farms of this country could really do with sheep if they would only give the matter attention.

"THE MIAMI VALLEY'S GIFT TO THE UNITED STATES," by Ed Klever, is a story of the origin and development of the great American hog in the state of Ohio, written by one of the most successful and experienced swine breeders of the present time.

"THE AMERICAN SADDLE HORSE," by Gen. John B. Castleman of Louisville, is from the pen of the foremost American writer on this subject, and is accompanied by several attractive illustrations, including a full-page picture of the celebrated Astral Klug.

"THE BEST TEN EARS OF CORN IN THE WORLD," by J. D. Harper of Purdue University, tells the story of how the world's championship was won by the grower, an Indiana farmer. This illustrated article will appeal to all who are studying increased corn production.

"THE MANAGEMENT OF A BREEDING HERD," by John Letham, was originally prepared at Mr. Sanders' request for the new book, "The Story of the Herefords," and has already been incorporated in that volume. It is regarded as such a lucid and practical statement of the general principles to be observed that it has been deemed worthy of a place in the Holiday "Gazette."

"THE STORY OF PERFECTION FAIRFAX," by A. C. Huxley, deals mainly with the early history of the bull that is frequently spoken of as the greatest sire of the Hereford breed. It is not without its amusing side, and as Mr. Huxley developed and brought out the bull originally he is in a position to write entertainingly of an animal that has won for himself a permanent high place in Hereford history.

"A DAIRY CATTLE SYMPOSIUM." The secretaries of the leading national associations of breeders of dairy cattle have responded to our request for contributions dealing with the progress of the Holstein-Friesian, the Jersey, the Guernsey, the Ayrshire, the Brown Swiss and the Red Poll during the year now drawing to a close. These interesting statements will be beautifully illustrated.

"THE BULL'S NATURAL ANTIPATHY TO MAN," by Charles Reid, the great Scottish animal photographer, strikes a new vein. It is the narration of an actual experience in photographing a bull in the various attitudes assumed in the act of charging. Needless to say, the photographer and his assistant took some risk in the making of these unusual negatives.

"THE HORSE OF HEAVY DRAFT," by William Prichard, is one of the most instructive narrations of actual experience in the production of draft colts that have ever come to our knowledge. This article carries a message of permanent value to the American farmer.

"EQUIPMENT OF CORNBELT FARMS," by E. T. Robbins, formerly associate editor of "The Gazette," will give to all those who are not already familiar with the facts a good idea of what is really required in the conduct of an up-to-date farm in the Middle West. The question of buildings, implements and general equipment is discussed from the viewpoint of the needs of the practical farmer.

"JEANIE, THE BELLE OF THE RAW," by John Clay, is a story of life on the Scottish Border from the facile pen of a man especially equipped to deal with the types most frequently met with in the farming of that famous district. This is beautifully illustrated with photographs taken in Scotland especially for this article.

"PABLO," by Will C. Barnes, is a story of sheep-herding in the Far West that is in the author's best vein. Mr. Barnes is well known to all readers of "The Gazette" through his occasional communications, as well as through his popular book on "Western Grazing Grounds," published by us last year.

"THE SELECTION AND FITTING OF STEERS FOR SHOW," by Chas. Escher, Jr., presents the result of many years' experience on the part of the most successful breeders and feeders of Aberdeen-Angus prizewinning bullocks. Feeders everywhere will wish to know what he has to say upon this subject.

"WALKING THE CROPS TO MARKET," by J. Brown Hitt of Sangamon county, Illinois, deals with the burning question of maintaining soil fertility in the Middle West through the maintenance of good live stock. Mr. Hitt is the manager of the famous Grove Park estate, and is practically demonstrating the value of cattle in the general scheme of farming.

"THE ROMANCE OF POULTRY KEEPING," by Miller Purvis, author of the standard book on poultry and staff correspondent of "The Gazette." Mr. Purvis is one of the best and most practical writers on this subject in the United States.

THE ILLUSTRATIONS IN THIS NUMBER ALONE ARE WORTH THE YEAR'S SUBSCRIPTION PRICE.

THE GAZETTE has been called by Prof. W. A. HENRY—the Dean of American Agricultural Scientists—"THE FARMER'S GREATEST PAPER." It is vastly broader now than its name indicates. It was established 1881, is published every Thursday and the regular issues range usually from 48 to 68 pages. Address

THE BREEDER'S GAZETTE, Room 1122, 542 South Dearborn Street, CHICAGO

:: "The Favorite Hens" ::

They Have Started Business

THE "Favorite Hens" at the egg-laying contest took their time about starting. That's one thing about a hen which has to be considered; no one can make a hen lay until she gets ready to do so, and there is no use finding fault with her because she doesn't start right in. On the whole, these "Favorite Hens" have made an excellent start. The first one to lay was the big Buff Orpington "Louisine" entered by Mrs. Emma H. Wood, of New York State. "Louisine" laid one of the first eggs which was found at the contest. The rest of the birds in her pen were apparently so much surprised, that they stood back and gave her every opportunity to take the lead. She had laid 14 eggs during the month of November, thus standing at the head of the 30 "Favorite Hens" for that month. She has started in already for December, laying five the first week and bids fair to prove one of the best hens in the entire contest. Her sisters, however, while a little slow at starting, will come forward in time, and who knows but that the final race may resemble that between the hare and the turtle, but it is "hats off" to "Louisine" thus far. The trouble with some of those other hens is the fact that they are still at the milliners, and haven't fully completed their Winter dresses yet. When they finally parade in full costume, we shall hear from them. We endeavored to obtain a good picture of Mrs. Woods to print this month, but unfortunately the one she sent would not make a good engraving. We hope to give a picture of Mrs. Wood later, and there will also be a picture of "Louisine" should she continue her good work.

"I have selected the nicest pullet from a flock of 100, hatched the first week in April, also she was the nicest from a pen taken from the same flock which won first at one of our county fairs. I cannot tell, of course, much of her ancestors as I take the largest and those that mature best as breeders. The cockerel which headed flock from which the eggs

Mrs. W. E. Phelps.
Owner of "Beauty."

were used for hatching came from eggs bought from C. H. Wyckoff and Son. A 240-egg machine, first and second testing 23 eggs out, hatch of 204 chicks from which I did not lose any little ones, only by a board dropping on two of them. I shall try to keep her from laying until you are ready for her. I do not use trap-nests and it is something of a puzzle to tell the best layers."

The Leghorn "Patsy" from Mrs. C. L. Todd, of Virginia, also laid a dozen eggs. She did not begin until the second week, but now she is going at a good pace. On Dec. 8 she led the crowd with 19 eggs. Then came the Leghorn pullet "Viola" from Mrs. Joseph Hollenbach, of Pennsylvania. This pullet laid 11 eggs, starting in the first week, and thus far giving a good account of herself—14 eggs to Dec. 8. A picture of Mrs. Hollenbach is shown on this page. She tells us that the cockerel she is holding in her hands is a full brother to "Viola." At the time when we were making the

Mrs. Josephine Hollenbach.
Owner of "Viola."

first arrangement for this contest, we wrote Mrs. Hollenbach about her hens and their breeding, and at that time she sent us the following brief statement about her birds, and how she would select the "Favorite Hen." Thus it appears that "Viola" is her busiest bird. Let us all hope she will keep this busy streak right up.

"I have 16 extra nice pullets hatched out of eggs I got from my winning pen. With this pen I had an old rooster, that is I bred father and daughter together. These 16 pullets were hatched on April 8. They have nice red combs and look as if they would lay any day. Out of these 16 pullets I will pick the busiest one that has a long back. I think a hen must have a long back to lay many eggs and must be busy to gather all the feed required for egg-making. I think tending and feeding has as much to do with egg-getting as anything."

Another excellent Leghorn is "Ity" sent by Mrs. A. J. Skellie of New York. "Ity" also laid 11 eggs, and is good for a great many more before the contest closes. On Dec. 8 her record was 15.

The R. I. Reds made rather a poor start. The first one to get going was "Polly," entered by Mrs. E. S. Marlatt of New Jersey. "Polly" took her time and did nothing at all during the first two weeks. Then she came to the front with nine eggs during the rest of November, beating every other one of the "Favorite Hens" in these two weeks. We rather expect some large returns from "Polly" before she gets through, as Dec. 8 found her with 16 eggs. The first week in December found "Betty M.," from Mrs. W. R. Merrick, with three eggs to her credit, also "Lady Hopeful," a Leghorn from Mrs. L. D. Happich, New York, was true to her name with two eggs. By next month many more of these "Favorite Hens" will be at work, and then we shall have a long list to report. As it is, the Reds and the mixed breeds have been rather slow to start, but we expect them to catch up and show what they are made of during the next few months. The Leghorns have made a remarkably good record. At the end of the first week in December these 10 Leghorns had laid 75 eggs. Out of 40 pens of Leghorns these "Favorite Hens" ranked No. 15. Out of the entire 100 pens in the contest they ranked No. 26. When we consider that these birds were taken from 10 different farms from four different States, and under differing conditions, we consider this a remarkably good record. We also believe that the Reds will show themselves well up to the front before the contest is much older.

The pen of mixed breeds may not do so well, although there are several birds

QUICK —AND— SURE Poultry Profits.

LET us show you how easily you can get into the poultry business and make money. Right now there's no business which offers a bigger profit on a small investment. You ought to raise a lot of chickens and we can start you right with a

Sure Hatch

Thousands are using this machine with complete success. The Sure Hatch has a 17-year record of satisfactory use. Its friends are enthusiasts. "I have tried other machines and find the Sure Hatch the best," writes Mrs. Orville Davis, of Markle, Ind.

The Sure Hatch is a high class machine in every respect. Will keep a hatching temperature in a room cold enough to freeze water. Requires little attention. We send complete instructions for operating and furnish a free copy of our Uncle Sam Poultry Book, which tells you how to run the poultry business for profits. **Let us send you a Sure Hatch, freight paid under our 10-year guarantee, on 60 days trial. Your money back if not as represented.**

Send for our big free catalog, which tells all about our machine. Get your incubator now. Early chicks always pay the best.

in that pen that will put a great surprise into those trap-nests. This "Favorite Hen" demonstration is attracting as much attention as anything else connected with the contest, and we are planning a few features in the way of prizes to be announced later, which we think will add to the excitement.

THE EGG-LAYING CONTEST.

THE output of eggs continues to increase, this. the fifth week, showing a gain over the previous week of 291 eggs. Every pen of White Leghorns produced eggs this week. Edward Cam's White Wyandottes, which took second place last week, are first this week, with a score of 43. In the total of eggs laid to date Cam's pen are second; Windsweep Farm's White Leghorns still lead with a total of 207 against Cam's Wyandottes, 201. P. G. Platt's White Leghorns are second in the week's score with an output of 40. F. M. Peasley's White Leghorns are third, their score being 37; 13 pens did not lay an egg this week, and nine pens have not produced an egg since this contest began. In the fifth week last year 841 eggs were laid, this year in the same week 1,462 were laid, a gain for the week of 621 eggs. But there are 180 more birds in the contest this year. The week's report follows:

GEO. A. COSGROVE.

Egg-bound Hens.

YESTERDAY I killed a young pullet and found in the egg-sack what appeared to be a composition of the color of an egg-yolk in a solid mass, which expanded the egg-sack to a very great degree and prevented the hen from passing the egg. Being afraid to use the meat, I killed and found the same condition in the second hen. J. H. W.
Red Bank, N. J.

It seems to me that for some unknown reason the membrane surrounding the ripened yolk is thinner than usual in these birds, and is either torn before it is shed into the oviduct, or accidentally broken afterward. The heat of the body would then cook the yolks into the solid mass found by G. W. I have had cases where the oviduct had split and the yolks were shed into the abdomen, and cooked there into a solid mass as large as a man's two fists, but I have never known this to happen while the egg was in the oviduct—egg passage. I referred the question to the authorities at Storrs College, and they diagnose it as "egg-bound," and suggest oiling the vent with a feather, and giving the bird a powder composed of one grain calomel and 1½ grain tartar emetic, repeating the dose in two days. Also give lime water to drink. This remedy was published in an English poultry journal some years ago. They also advise manipulating the parts with the finger, using plenty of oil.

Marketing Duck Eggs.

Is there a good market for duck eggs, and if so, where is it best to ship them from Southern New Hampshire, price range, etc.? People here are a little undecided as to whether to enter into the hen or duck business. It has occurred to me that perhaps (everything being equal) if duck eggs can be as readily marketed as hen's eggs, the duck raising end of the business would gradually get ahead of the hen business in all-around profits. Is this the correct view? I. C. R.
New Hampshire.

I would advise hens on general principles. Runner ducks are great layers and individual records have been made that exceed any made by hens, but 300-egg ducks are as scarce as 200-egg hens. Moreover a duck will eat more than a hen. It is my opinion that the profit on any extra eggs would be taken up by extra feed. Ducks' eggs are larger than hens' eggs, are worth more and usually bring a little higher price, but the market is limited. There is a prejudice on the part of most American women against ducks' eggs. You could easily learn of the Boston market for ducks' eggs by inquiry at the markets in that city, and then judge for yourself whether or not it would pay to try the production of ducks' eggs on a commercial scale.
W. H. H.

Pumpkins for Hens.

ARE boiled pumpkins mixed with middlings and cornmeal good for laying hens? A. F. C.
Maine.

Yes, if not fed in excess. This would be a fattening, rather than a laying, ration, however, and should be supplemented by more highly nitrogenous foods, such as oats, wheat, gluten feed, wheat bran and meat products or skim-milk if heavy laying is to be encouraged. In a cold climate and particularly during the Winter a moderate amount of the pumpkin mash might well be used. M. B. D.

Nest Eggs.

WILL you give your experience in regard to the use of nest eggs by farmers and poultrymen? S. G. M.
New York.

Nest eggs have largely gone out of fashion in poultry circles and, except for the guidance of pullets just beginning to lay, I believe that they are seldom used nowadays. It used to be thought that hens would desert nests which were entirely robbed and lay elsewhere. This is to a certain extent true when hens have their liberty to lay about the barns, but in poultry quarters under confinement nest eggs do not seem to be at all needed, and I know of no poultrymen who make a practice of using them.
M. B. D.

CHICK and EGG SHIPPING BOXES Ship chicks or eggs safely in "H & D" Boxes. Chicks cannot smother or sweat. Eggs will not break. Waterproof, sanitary, compact—handy to use. Strong but light. Made of double faced, corrugated jute board. Cut down your express bills—guarantee safe arrival of contents.

R. MacKELLAR'S SONS CO., Peekskill, N.Y.

THE MOST ECONOMICAL OF ALL POULTRY FEEDS ON THE MARKET
They are made right; because they are bought right. They are thoroughly dependable, always the same, and always fresh. There is no waste, no bad, musty or sour grain or corn hulls. Everything goes to make eggs, muscle and feathers. They are much more economical than any feeds that you can mix as we have the equipment to thoroughly mix and clean all grain. We have a master in the art of poultry breeding and raising; also thoroughly posted on feeds and grains. There is nothing lacking in the make-up of our feeds. We have customers all over, from the Island of Trinidad, Panama Canal Zone, Bermuda, Canada, and all through the Eastern and Southern States. By sending your orders to us we are benefited and so are you. Send for circular and price list. WM. ORR & SONS, Box 8, Orr's Mills, N.Y.

S. W. JONES, - - Hillsdale, N. Y.

Publisher's Desk

THE test of our work for the preceding year always comes about the holiday season. In the average weekly publication the subscription season begins just before Christmas, and a large percentage of the year's renewals come in the latter half of December and the first half of January. The test of the publisher's service comes at this time. Every renewal is a note of confidence. Occasionally there is a discontinuance of a subscription for other causes; but if subscribers refuse to renew in large numbers, the publisher and editor must seek the cause in their own service. Even delayed renewals indicate a lack of enthusiasm for the work being done. A flood of prompt renewals, on the other hand, is the strongest expression of approval of the work of the past and of confidence in the service of the future.

THE R. N.-Y. now approaches its readers once more with a request for judgment. In this pronouncement we must appeal to your charity as well as to your business judgment. Like all human agencies, we have our faults. We are a long way from making a perfect paper. We are seldom, if ever, entirely satisfied with a single issue. We make no claim to perfection in results. It is true that we often feel ourselves that we ought to produce a better and more helpful paper. Our one claim to consideration is that we do the best we know how, and we spare neither time nor work, nor expense in the doing.

Twenty-five years ago farm papers were not run on any high ideal. Many of them—indeed most of them— had a large tendency to exploit the farmer rather than to serve him. Swindling advertising was common: and deceptive advertising disguised in text type was a feature of practically all of them. The farmer had a strong suspicion of the situation. It was not infrequent that he finished the reading of an article with the inquiry, "How much did it cost?"

THE R. N.-Y. had always stood high as an agricultural publication, but it was not entirely free from the general taint of the time. In assuming its management, the two men, publisher and editor, who were from that time on to direct its career, decided to dedicate its columns absolutely as best our judgments and abilities would permit to a real service to the farm and the farmer. We may have erred, and we may have failed; but we have never wavered in our purpose to that end. THE R. N.-Y. is the expression of the best service that Herbert W. Collingwood and John J. Dillon and their aides are able to give the farming interests of this country. If others succeed better and do more it is because of some other factor than honest intention pursued week after week, year after year, with the one dominating purpose to serve the industry in which we were bred, and the men and women by whom we are encouraged and supported.

We have been encouraged to believe that this is the kind of service you want. We started with some twenty-odd thousand paying subscribers. Today they have increased to 160,000. Then the business employed about a dozen people. Today the payroll numbers nearly one hundred. Then a flat-bed press slowly turned out the weekly edition from single sheets that had to be folded and bound by hand or other machinery. Now two perfecting rotary presses take the paper from a roll, and turn out perfectly folded papers at the rate of 12,000 copies an hour. Then the largest edition we ever published was 20 pages. Last year the largest paper was 64 pages. A single issue then required about 1½ tons of paper. Our largest edition now requires about 30 tons; and the average issue takes 20 tons of paper. Then our printing was done by contract on other people's presses. Today our own presses, established at a cost of about $50,000 are turning out the paper. Then we paid $1,200 a year rent in a corner of a large loft in the down-town manufacturing district. Today THE R. N.-Y. occupies its own home in the heart of the business section of the metropolis.

We confess to some pride in this record; but it is not recorded here in any spirit of vanity. This address to you is not a boast, but an appeal. It is an expression of our acknowledgment of your growing confidence in our service and constant encouragement of our work.

We have no right to appeal for the patronage of the farm on any ground, but that of service to it. If you believe that we are trying to give you an honest service, and that THE R. N.-Y. is the inspiration to the farmer and his family that a farm paper should be, and the staunch champion that the interests of the farm demand, then we ask you to continue your coöperation with us in all rightful demands, and especially at this time, give us the convincing evidence of your approval in the prompt renewal of your subscription.

For several years past our regular subscribers have got in the way of sending a yearly subscription of THE RURAL NEW-YORKER as a Christmas present to friends. The custom grew to such an extent that last year we prepared a Special Gift Card, which we mailed to reach the recipient for Christmas or New Years, as directed, with the compliments of the donor. As a result a much larger number of orders were received than ever before. We are prepared to do the same this season. We would not assume to suggest to anyone to make gifts who did not have the purpose to do so, but most of us have more wish and inspiration to remember friends than we have means or time to satisfy. It is often a bother to know just what to send. To such friends we suggest a subscription to THE R. N.-Y. You simply send the name and address and the dollar, and we do the rest for you. This is not only an annual remembrance, every week of the year, the regular visit of the paper will be a reminder of your thought and interest in the person who receives it.

On Feb. 21, 1913, I gave Bradley Bros., of Makanda, Ill., an order for 3,624 strawberry plants, sending check with order to the amount of $14.20 to pay for plants. These plants were guaranteed to be true to name, as you will see from the enclosed guarantee. You will also note the number and name of plants marked on price list (10 varieties). When these plants began bearing last Spring they proved to be all of one variety and that a very poor one for this section. I cultivated the plants well and was expecting a good crop of berries this season, but only got a few small berries, all of the same variety. I have written them several times and they don't answer my letters. W. T. S.

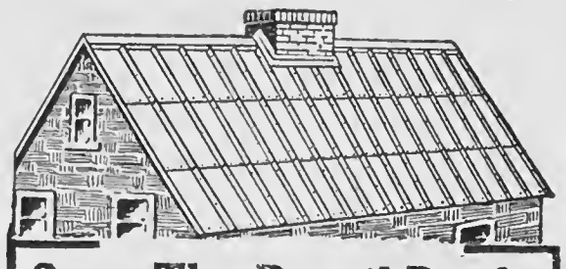
Kentucky.

It will be remembered that Bradley Bros., of Makanda, Ill., advertised last season to send a dozen plants "free" to anyone answering their advertisement. When the reader of the advertisement made application for the "free" plants he was told that the variety offered were female plants and that in order to get a crop of berries he would have to plant an equal number of male plants which they advertised for sale. No one doubts that the buyer would pay for the second lot, all or more than both lots are worth. We are not surprised at the above report regarding any concern that will resort to such a fake scheme as above outlined to sell strawberry plants. For well nigh 20 years we have been obliged to warn our subscribers against Bradley Bros. These brothers have assumed many names during this time, some of which are as follows: Bosky Dell Nursery Company, Jackson County Nursery Company, Bradley & Bradley, Bradley Bros. etc. The season is near at hand when Bradley Bros. will be making an appeal for the trade of fruit growers for the Spring of 1915. The above experience may save other fruit growers from similar annoyances and loss.

The ideal of the Department of Foods and markets is to find a profitable market for the products of the farmers of the State of New York; and at the same time to devise such an economic system of distribution of farm food products that, through the saving, the farmer may receive more and the consumer pay less.

J. J. D.

"I SEE that local option is likely to win out your way." "Yes," replied Uncle Billy Bottletop. "But the fight ain't fair. A man who never uses alcohol generally looks like a good argument, while a regular rumpunisher's liable to be only a horrible example."—Washington Star.



Save The Retail Profit

Buy galvanized steel roofing direct from our Mill at wholesale prices. Get the guaranteed quality at the price of the ordinary grades. We pay the freight.

Easiest to Put On—Outlasts All Others.

Our roofing is the easiest, quickest and cheapest to put on; anyone can do the work; no special tools required. SPREADERS $64.75 UP

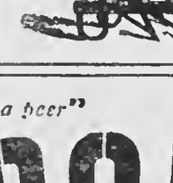
RAISE BIGGER CROPS
My New No. 8 Low Down Manure Spreader

used now means bigger crops next year. You know this yourself. Manure spreading time is all the time. This new No. 8 Low-Down Manure Spreader is Galloway's greatest spreader.

Positively the best spreader on earth. Double chain drive, endless apron; force feed; front wheels cut under load; close hitch; lightest draft of any low-down machine. Capacity 60-70 bushels. All steel gear, complete with double-trees and neck-yoke. Flexible rake; high speed beater pulverizes finely any barnyard material. Steel wheels; gears coupled with channel steel, trussed like a steel bridge. Box rests on rear trucks, 42 inches high. Superior in every respect to new fangled freaks of heavy draft that eat you up for repairs, annoy you and kill your horses.

K. K. Fouet, Ashley, Ohio, writes: "Please find draft for spreader received October 5th. Assure you I am more than pleased with same. It has proven all you claim and more. By buying of your company, I saved $21 80 and got just what I was looking after."



My Book "A Streak of Gold" FREE

tells all about handling manure to get the greatest profit. Do not buy a spreader of any make at any price until you have dropped a postal asking for this great book worth $1.00 (costs you nothing) and my BIG SPECIAL SPREADER CATALOG that tells the truth about the spreader business. Mailed free. Get RIGHT on this spreader proposition before you buy.

EMPIRE No. 9 EMPIRE, Jr.

Tells why they last longest—why they do not rot nor sag—why they stay hog-tight and cattle-tight—why they are by far the least expensive fences to buy in the long run. Farmers, everywhere, are investigating fence quality. Users insist on knowing the quality underneath, just as they know how to judge a horse. You cannot fool an experienced buyer with an old horse doped up—polished up—to look like a good horse. You cannot fool an experienced buyer with a poor fence doped up to look like a good fence. A penny postal brings you the money-saving book. Write today.

Products, Prices and Trade.

Wholesale Prices at New York,

Week Ending Dec. 11, 1914.

MILK.

The Borden milk schedule to producers for the six months beginning with October is as follows. This is per 100 pounds in the 26-cent zone. This is what is known as the "maximum" for milk testing 3.8 to 4.2 per cent. fat, and is 20 cents per 100 pounds above the "flat" rate.

	1914.
October	$2.00
November	2.10
December	2.10
January	2.05
February	1.95
March	1.90

Wholesale prices paid by New York dealers are running $2.01 and $1.91 for B and C. Hotel and restaurants using two to three cans per day are paying five to six cents per quart, single quart prices from bakeries and grocery stores, six to seven cents; delivered milk, nine to 10 cents.

BUTTER.

The quality of fresh receipts is quite irregular, and the proportion of fancy rather small. Business in medium grade creamery is slow; ladles and good packing stock selling well.

Creamery, extra, above 92 score, lb	33½	@	34
Extra, 92 score	32½	@	33
Good to Choice	28	@	32
Lower Grades	23	@	25

Process	22	@	26

Elgin, Ill., butter market 32 cents.
Philadelphia, western creamery, 34 cents.
Boston, western creamery, 33.
Chicago creamery, 24@32.

CHEESE.

The volume of trade is very light, as speculators, especially in Wisconsin make, are asking more than exporters will pay. Some sales of western twins at 15 cents have been made.

Whole Milk, fresh, specials	16	@	16¼
Average fancy	15½	@	15¾
Under grades	12	@	14
Daisies, Wisconsin	14¾	@	15¼
Skims, specials	13	@	13½
Good to choice	11	@	12
Poor to fair	7	@	10

EGGS

Prices remain on practically the same basis as for the past month. An occasional lot of nearby white, large sizes, sells up to 65 cents, but 55 to 60 covers most of this stock. In medium and lower grades the range is very wide, with a surplus of qualities priced around 30 cents. Storage eggs of average grades are being worked off as rapidly as possible.

White, choice to fancy, large	58	@	62
Medium to good	42	@	52

Common to good	25	@	20
Storage, best	28	@	30
Lower grades	18	@	29

FRESH FRUITS.

Apple receipts early in the week were heavy but sales good, so that there is no decline in prices, except on culls. Pears, except Kieffer, are getting scarce, and moved as rapidly as possible. Grapes very low; cranberries plentiful and cheap.

Apples—BenDavis, bbl	1 50	@	2 00
York Imperial	1 75	@	2 50

The New York Health Department recently condemned 600,000 pounds of coffee, which had been damaged by water on the trip from South America.

*

Fire losses in this country and Canada for 11 months ending with November amounted to $215,000,000. There were 55 with damage above $100,000, and two of $1,000,000.

*

The wool embargo on shipments from Great Britain has been modified to permit sending merinos to the United States on guarantee that they will not be forwarded to hostile countries.

*

Our trade with Sweden since the war began has doubled as to our imports, and in exports increased from $104,600 in August to nearly $3,000,000 in October. Some of our products in greatest demand there are: Grain, oils, paints and drugs, raw cotton and wool, naval stores, leather, ash and hickory, and tobacco.

*

Because of the tie-up of nearly 5,000,000 tons of shipping, and the recent heavy export demand, freight rates to Europe are more than three times last year's prices on some staples and double on others. Current berth rates to Liverpool are: Grain, bu., 7½ cents; flour, 100 lbs., 26; cotton, 100 lbs., compressed, 75; butter, ton, $15; meats, ton, $7.50; leather, ton, $5.

*

The Government report shows ginning of 13,066,105 bales of cotton up to December 1, or about 1,900,000 bales more than at the same date last year. Ginnings in the principal cotton States follow: Texas, 3,764,694 bales; Georgia, 2,285,607; Alabama, 1,438,389; South Carolina, 1,225,476; Oklahoma, 1,018,287; Mississippi, 986,998; Arkansas, 840,562; North Carolina, 674,135; Louisiana, 381,913; Tennessee, 291,329; Florida, 72,859. In addition to above, Georgia ginned 33,101 bales of Sea Island; Florida, 27,468; and South Carolina 2,422.

THE KICKING COW.—Tell the man who has the kicking cow to secure the cow's head and then take a stout piece of half-inch rope about four feet long, place the middle of it at the middle of the cow's left hind leg, just above the hock joint, bring the ends of the rope between her legs, crossing the ends of the rope, wrap the rope around her right hind leg and tie in a knot easily untied, drawing her right hind leg back far enough so she can be milked. I had to tie a "professional" kicker in that way from April till the next March, when I sold her for beef.

F. S. WEBB.

Subscribers' Exchange

200 FERTILE ACRES—Bordering beautiful little lake in famous lake region of Central New York, can be bought for cost of improvements. E. W. ALLEN, Auburn, N. Y.

235 ACRES fine Steuben County fruit and dairy farm; will sacrifice this month for only $31 an acre, worth nearly double. Address Owner, 41 E. Washington St., Hornell, N. Y.

FOR SALE—Fully equipped poultry and fruit farm, beautiful location, handy to New York and Philadelphia markets; rare bargain. Inquire L. W. A., Rural New-Yorker.

WANTED—To rent with privilege of buying for next Spring, a truck farm of 100 acres in Long Island, within 50 miles of New York, near station. Care of W. A. D., care R. N.-Y.

FARM WANTED—From 100 to 300 acres, not over three miles from a town of not less than 2,000 people; prefer one equipped for dairy; must be good buildings and soil. Box 308, Groton, N. Y.

WILL exchange income property in Hackensack and East Rutherford for farm, having tillable, pasture, woodland, within seventy-five miles New York City, near railroad; want water power or place to build one. 105 Poplar Ave., Hackensack, N. J.

Subscribers' Exchange

Complying with several suggestions received recently, we open a department here to enable RURAL NEW-YORKER readers to supply each other's wants. If you want to buy or sell or exchange, make it known here. This Rate will be 5 Cents a word, payable in advance. The name and address must be counted as part of the advertisement. Copy must reach us not later than Friday to appear in the following week. No display type used, and only Farm Products, Help and Positions Wanted admitted. For subscribers only. Dealers, jobbers and general manufacturers' announcements not admitted here. Poultry, Eggs and other live stock advertisements will go under proper headings on other pages. Seed and Nursery advertisements will not be accepted for this column.

YOUNG MAN wants to learn commercial, egg and poultry business. LESTER WAMSLEY, Anthony, R. I.

PRACTICAL, intelligent, experienced, married man desires responsible position on farm. C. L. B., R. N.-Y.

WANTED—At once, strong, reliable young man, single, some experience for general farm work. No liquor. MEADOW FARM, Hartsdale, N. Y.

WANTED—Good German or Danish farmer to work large farm on equal shares; twenty cows, hogs, hay and orchard. H. M. DAVIS, Attica, New York.

POULTRYMAN, married, 26, desires position Jan. 1; best references furnished, capable handling plant any size. GEO. TILTON, Poughquag, N. Y.

YOUNG MAN (23), desires position January 1 on dairy or stock farm; experienced thoroughbred Holsteins. NORMAN DIECKS, Chatham, New Jersey.

WANTED—Position for my farm hand; season's work done; good, all-around worker, strictly sober, honest, reliable. EDW. MORGAN, Plainfield, N. J. R. D. 1.

EXPERIENCED ORCHARDIST—Married, desires position as working manager of modern fruit farm; thoroughly familiar and capable; American, references. SANFORD, care Rural New-Yorker.

POSITION WANTED as manager or superintendent of farm or estate by practical farmer with 16 years' experience; sober, reliable, industrious, careful and well educated; small family; southeastern Pennsylvania preferred. J. HOWARD BROOMELL, Kennett Square, Pa.

FARMER ON SHARES—20 acres, near Camden, N. J., 6 room house, 1,000 peach trees, all kinds of berries, suitable for early garden truck, completely stocked except horses and wagons, which farmer must furnish; prefer man accustomed to marketing his own goods; would consider furnishing breeding hogs as a side line; willing to make weekly advances to reliable man; give full particulars, experience, references, size and age of family in first letter; to man handy with tools I can give considerable work during winter months; excellent opportunity for reliable experienced man. GWILLIAM, 623 S. 6th St., Philadelphia, Pa.

ALFALFA HAY—F. P. ERKENBECK, Fayetteville, N. Y.

NEW HONEY—Basswood or clover in sixty-pound cans. Write for prices. C. A. HATCH, Richland Center, Wis.

APPLES, APPLES, APPLES—For choice sprayed Winter Apples. Please order to-day. C. J. YODER, Grantsville, Md.

FOR SALE—Number twelve, power Mann Bone-cutter; cost new $30; freight prepaid 100 miles for $17.50. CARRYL, White House Sta., N. J.

7-INCH PAPER KNIVES, hand-made; oak, hickory, barberry, huckleberry, apple, red cedar, on hand-painted cards, 25c. KNAPP, Caryville, Mass.

FOR SALE—Avery three-bottom, self-lift engine gang plow; does not fit my tractor and used but a few hours. C. T. WILLSON, Millerton, N. Y.

EXCHANGE—Champion bred Airedales, female pups entitled to registry, for incubator, Brahmas, bronze turkeys, or offer. THE HILL FARM, Cummington, Mass.

28 INCUBATORS FOR SALE—All models, 260 and 360 eggs, in first-class condition; reasons for selling, am installing a Mammoth machine; write for prices. CHAS. R. STONE, Staatsburg, N. Y.

GRAPEFRUIT AND ORANGES—By express in half or whole boxes, F. O. B. Miami, Fla., fancy brights at $1.75, Golden Russets at $1.50 per box, with order; delivered prices quoted on request. GEO. B. CELLON, Tropical Grove, Miami, Fla.

WANTED—Good fertile farm with good building, etc.; give full description and price. R., care R. N.-Y.

FOR SALE—Vineland, fully equipped plant, trolley, gas, water systems. Box 40, Rural 2, Millville, N. J.

100 ACRE FARM FOR SALE, with or without milk route, stock and tools, 3 miles from city of 38,000 inhabitants. Particulars inquire P. F., R. N.-Y.

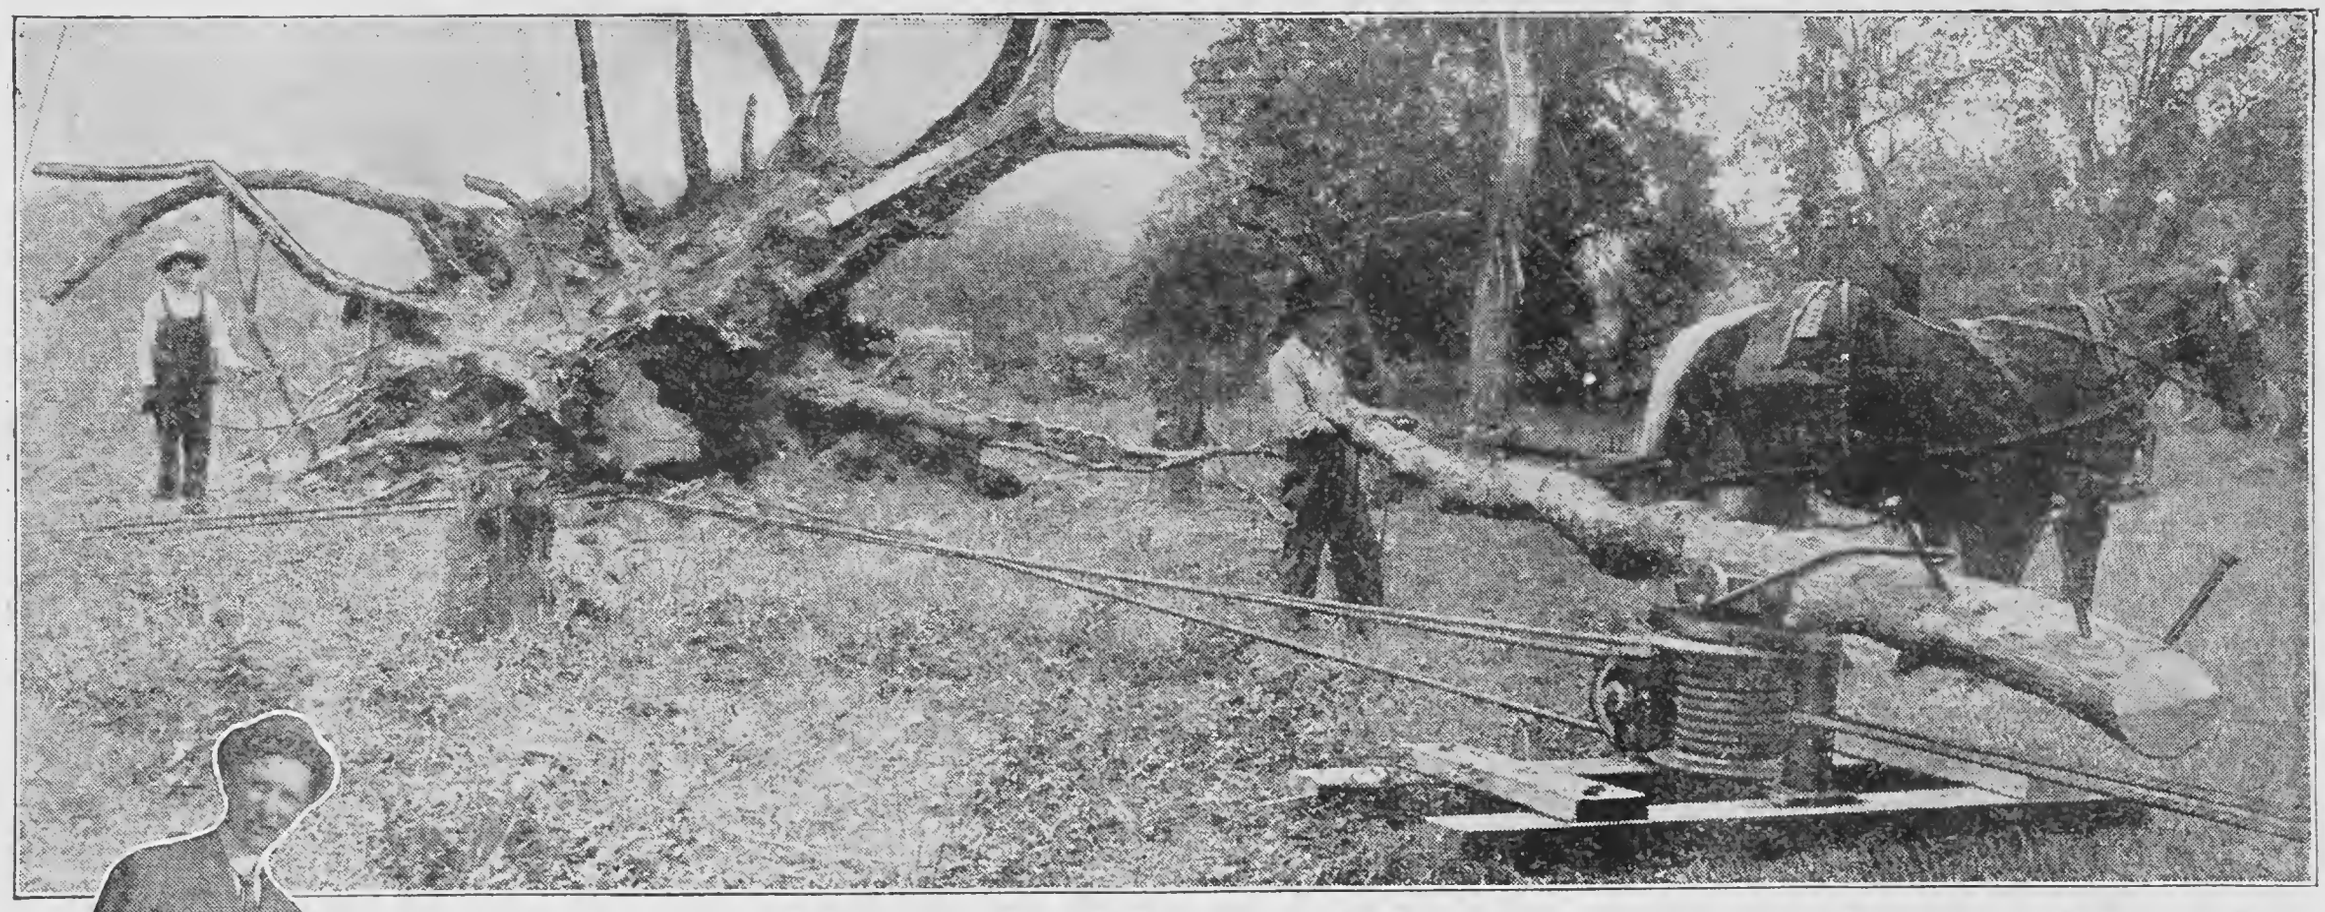
SAFETY FIRST WITH THIS ALL STEEL
UREKA SAWING OUTFIT

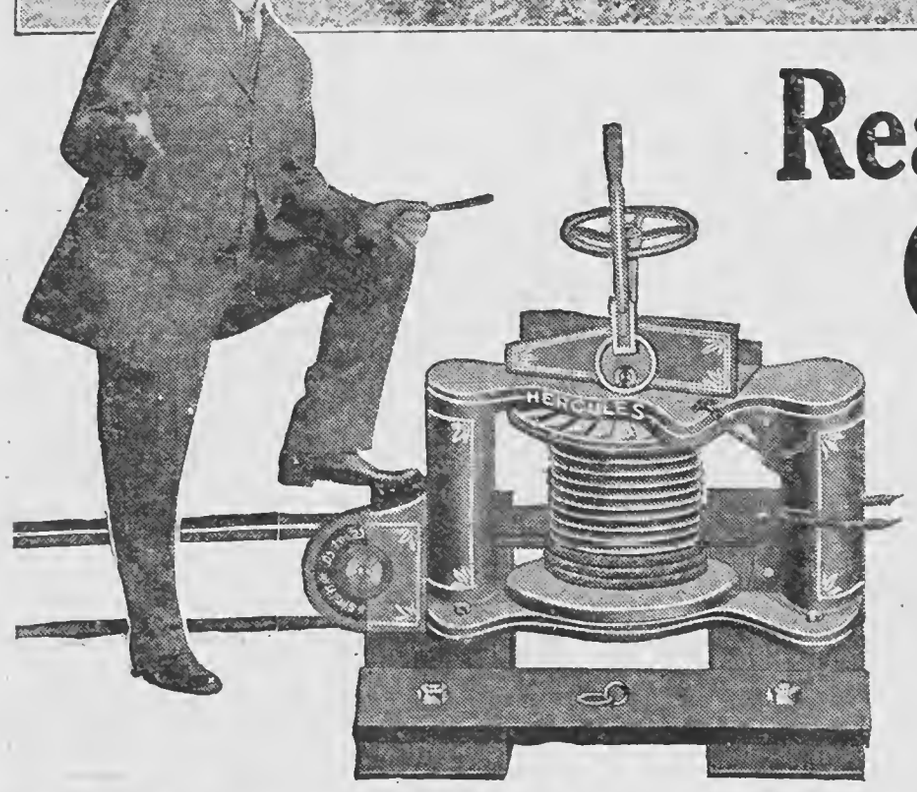
You Need This Money Maker on Your Farm

Easy terms to good farmers.

SAFETY FIRST. The all steel Ureka sawing outfit pictured above, shows the safest and most complete sawing machine ever offered for farm work. Having no wood in its construction, wind or snow does not affect it; no chance for timbers splitting; no chance for parts coming loose and injuring the operator. It is not only a safe machine, but a durable one, but it has the further advantage of being made so that the man behind the saw can do a big day's work with the least possible effort. The construction of the table makes easy sawing possible. It is the result of 18 years' experience in building sawing equipment. The power is the wonderful Excelsior engine, the engine admitted by all as being the best now on the market. You need this outfit on your farm. It is a money maker and a labor saver. You should not sleep another night until you sit down and write for information. If you tell us the size farm you have, we will make you an interesting proposition, but do not delay. Write the letter to-day.

R. CONSOLIDATED GASOLINE ENGINE COMPANY. 202 Fulton St., New York City.





Read How Fortunes Are Made Quick By Pulling Stumps

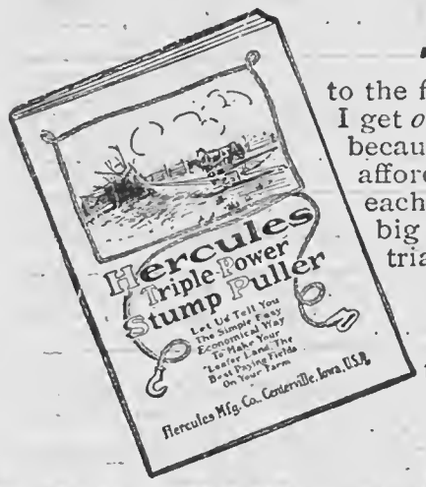
LET me send you my new, fine, free book at once. I want to show you *proof* of how you can turn each acre of stump land into a double profit the first year, in extra crops and added value of land —by pulling stumps with the Hercules All Steel Triple Power Stump Puller—and how you can make *big Money* in *your spare time* by pulling stumps for *your neighbors* or *by renting* your machine at a *nice fat profit*. My book shows *actual photographs* and prints, *actual letters* from many *owners*, telling of the remarkable feats of the Hercules—how it pulls *any size stump*, *green tree* or *hedge* in less than five minutes—how it easily pulls *an acre a day*. Read how one man increased his land value from $25.00 an acre to $125.00. Read why the Hercules is the *best investment* you can make now. The

Hercules ALL STEEL TRIPLE POWER Stump Puller

is the puller that has the single, double and triple power features, giving you three machines in one. There isn't a stump, green tree or hedge grown that the Hercules won't pull out without straining or breaking any castings. It's the low-down constructed puller that has self-anchoring and stump-anchoring features—the one with double safety ratchets, that insure the absolute safety of men and team. I want to send you a Hercules on

30 Days' Free Trial

so you can *see* how *powerful* it is and how *easy* it *works*. I want you to *know* for yourself that the all-steel construction means 60% less weight and 400% greater strength than cast-iron or "semi-steel." Besides that, I want to save you big money on the cost. I'm making a



Special Price Proposition

to the first buyer in 5000 different parts of the country. If I get *one* Hercules in each locality *more will surely follow* because of Hercules quality and efficiency. So I can easily afford to sacrifice my profit on the *first* machine in each locality. Take advantage of this big profit and big saving opportunity *now*. Besides my 30 days' free trial offer and money-saving price I give you a

3 Year Guarantee

that *means* something. The *all-steel construction*, *the triple power* feature that saves your team and gives a tremendous increase of power, the *double* safety ratchets and the careful *turning* and grinding of every part—all these things make it *safe* for us to *guarantee the replacement of any casting of a Hercules that breaks any time within three years, whether it is the fault of the machine or your fault*. Also portable hand puller for the man who has no horses.

This Free Book Tells All

Just simply send your name and address on the coupon or on a postal so I can send you the convincing facts about the superiority and efficiency and value of the Hercules Stump Puller. Only 5000 of these machines will be sold at this remarkable introductory price, so get your name in now. My new book is a beauty. See the real pictures of big stumps it has pulled out like you would pull weeds. Read the many interesting letters from farmers, lumbermen and land promoters. Stumps, stumps, stumps, pulled out quick, making fortunes for owners of Hercules Stump Pullers. I want you to know the facts. Just

Mail Coupon or Postal Now

I'll send the book and price by return mail. I'll tell you the best crops to raise on virgin land where stumps were before. I simply want to get my free book to you at once, so that you can read the remarkable facts about the Hercules All Steel Triple Power Stump Puller and how it does such a splendid work making big profits for owners everywhere. *Mail me the coupon or postal* right now, before you forget, or take down the name and address and write me as soon as you get a postal card. Address me personally,

HERCULES Portable One-Man Puller For Use Without Team

THE only portable one-man puller on the market. By pulling 100 pounds on the sweep one man can develop a pull of 50,000 pounds on the stump. When stumps are out a 14-year old boy can move puller. No heavy lugging or dragging.

The Hercules Portable excels all other hand machines, because it is so light, strong and easy to handle. It develops more power with 6 ft. lever than any other machine with 10 ft. lever.

The ideal machine for the man who has no horses. Write for particulars.

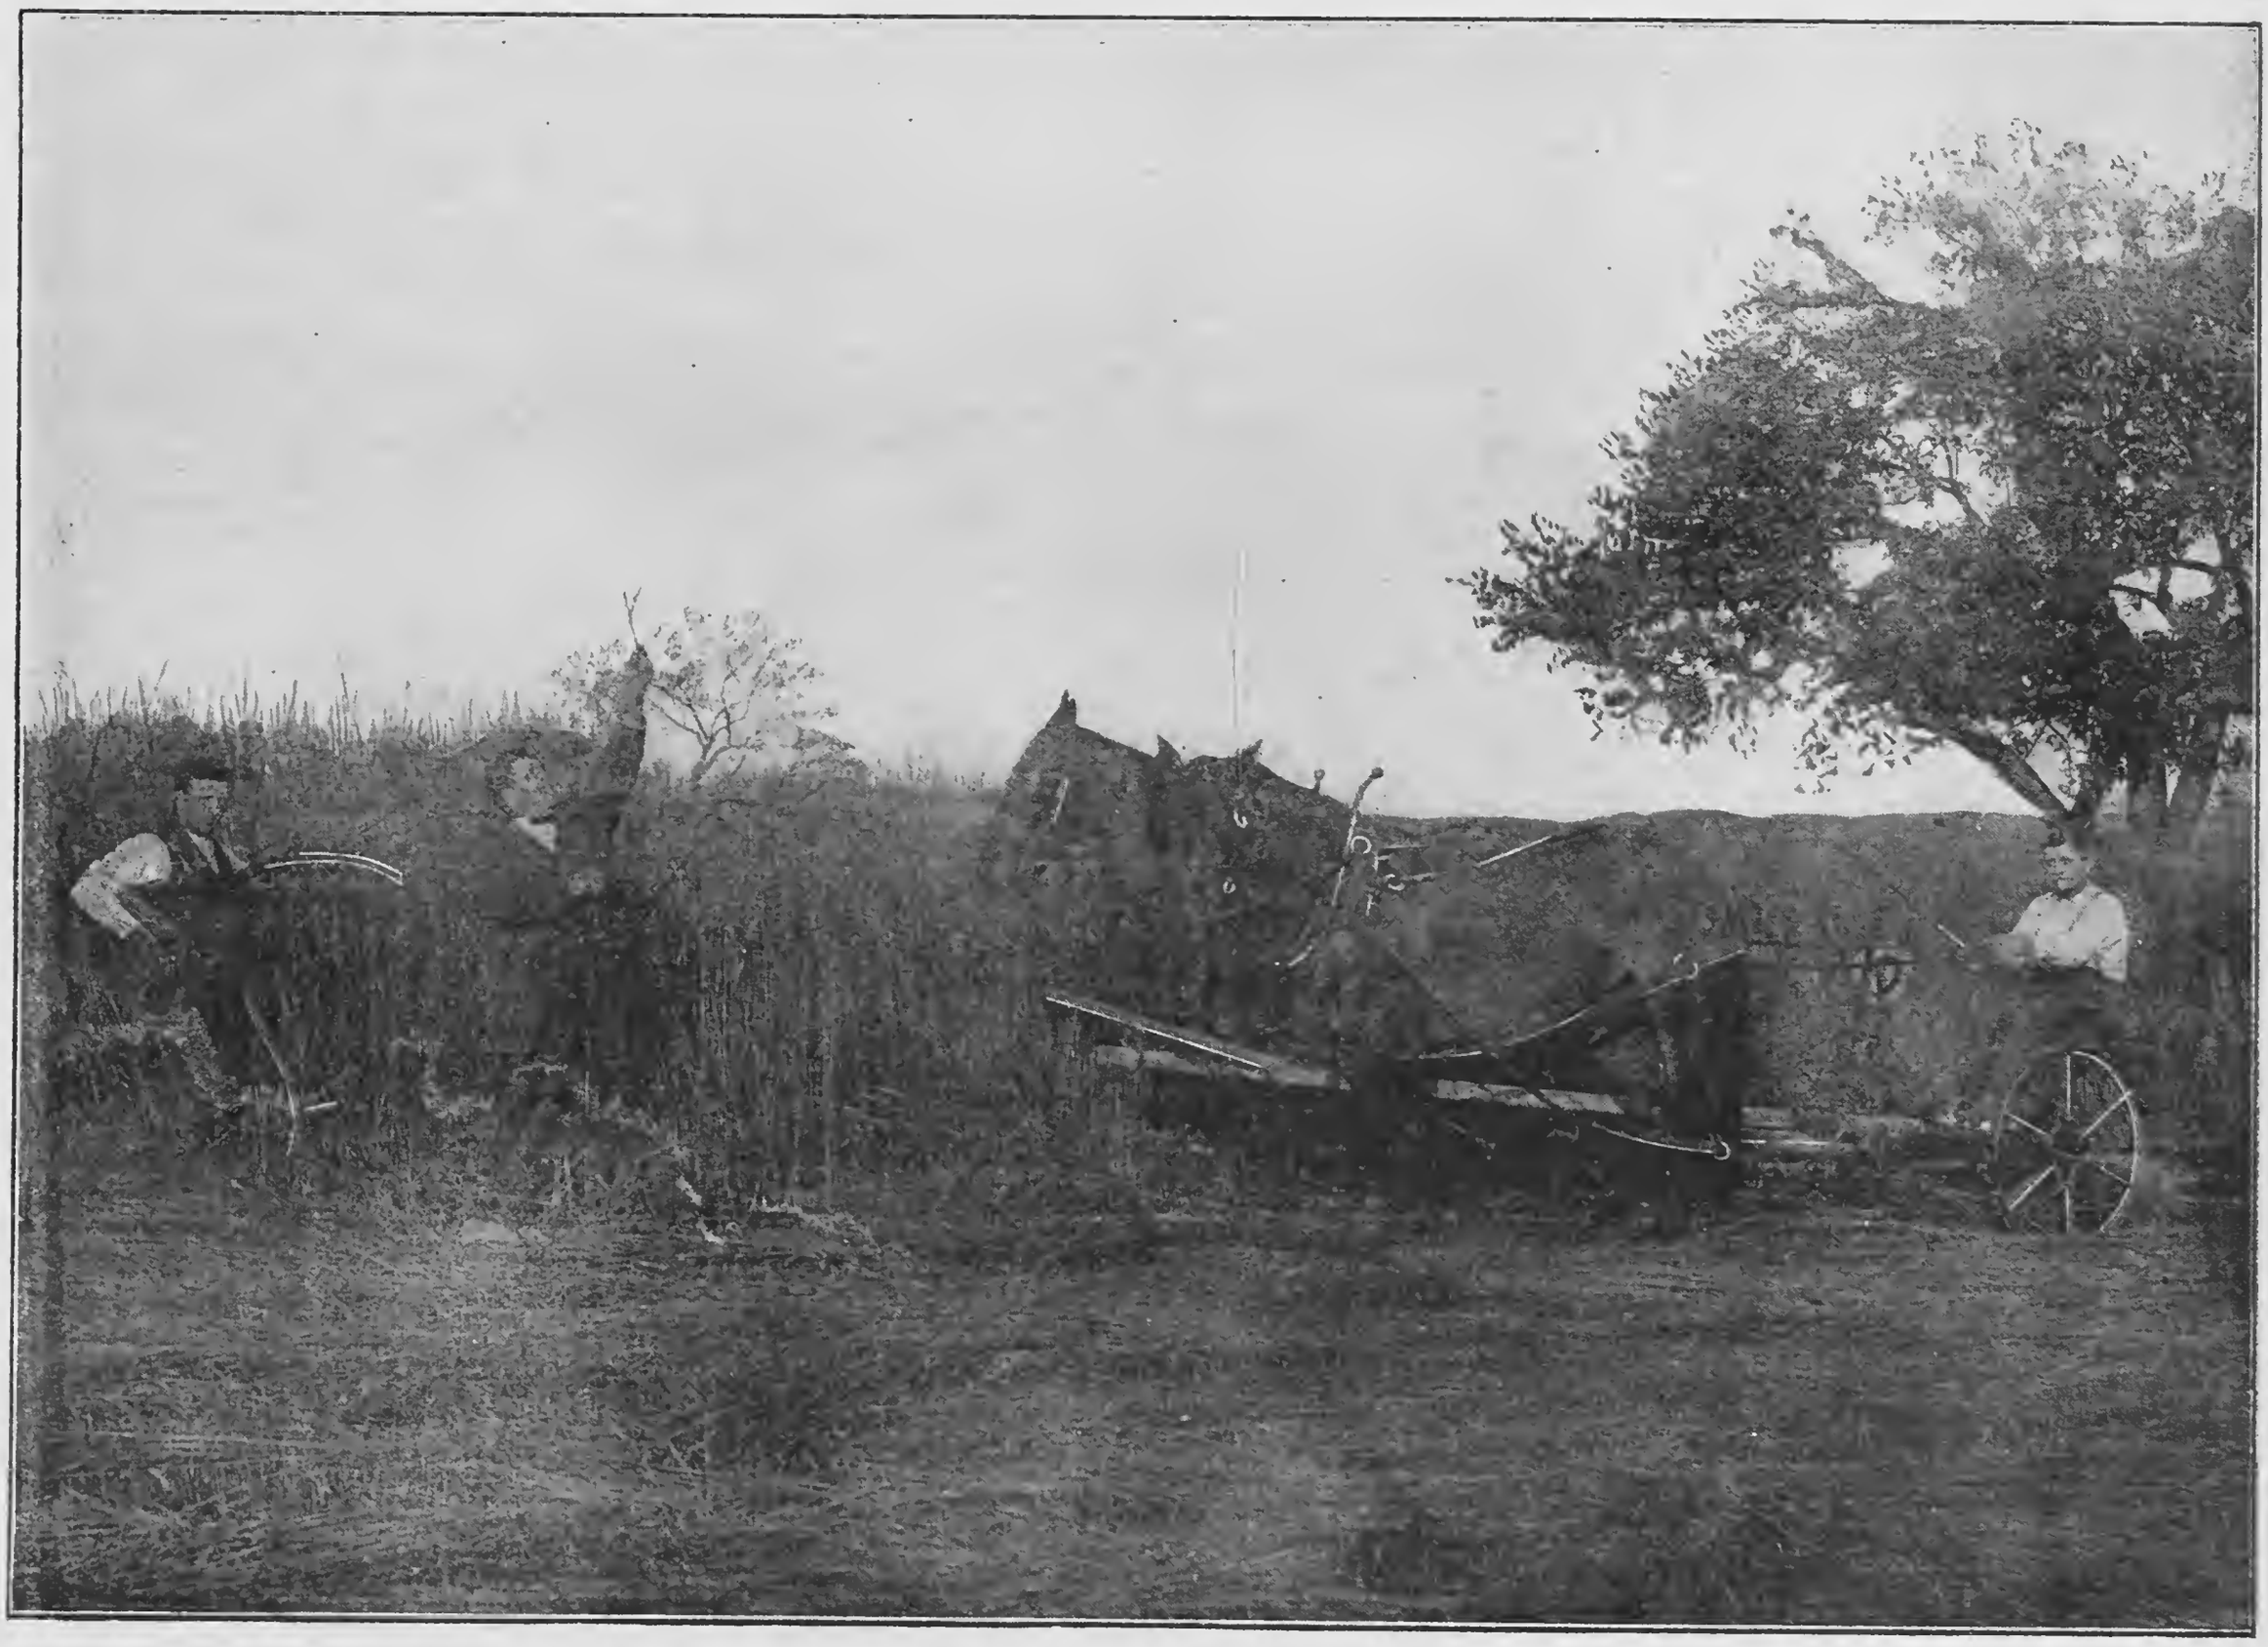
THAT ELECTRIC LIGHT PLANT.

More About Its Convenience.

STORAGE BATTERIES.—There have been a number of inquiries about the article about the electric light plant, in the issue of November 21. These letters ask about storage batteries. I am not an electrical engineer, but I have taken pains to find out a good deal about the practical use of electricity on the farm. Storage batteries of today, while good, are expensive, and perishable. Two years is the average life of a lead battery, with good fortune; four years is the limit of the guarantee on the latest Edison battery. In small installations, they are practical only for electric lighting. Electric stoves and electric motors use too much current. The battery would have to be large, and its cost would be prohibitive for the average farmer. Nevertheless, if I did not have water power, I would put in a gasoline engine, and possibly a storage battery, under certain conditions. There are several makes of engines on the market which generate electricity at low pressure, from 12 to 30 volts, which permits a small battery. These give the best service in the world for electric lighting, but the use of electric irons (the best thing ever invented for a kitchen), electric stoves, and electric motors, is impracticable with them. So if you want only electric light, and haven't water power, and can install the plant near the house, one of these sets is fine.

TRANSMITTING CURRENT.—One man writes me: "There are five of us, living within a quarter of a mile of each other. Would a five horse-power gasoline engine give us enough power for lights all around? Would storage batteries be required?" A quarter of a mile, or even an eighth of a mile, is a long distance to transmit electric current from a storage battery. Wire offers resistance to the passage of electricity, just as iron pipe offers resistance to the passage of water—slows it up. Without a high-voltage battery—say 110 to 125 volts—too much energy would be consumed delivering the current. Twelve or 30-volt batteries would not do it economically. If this engine and battery were in a man's woodshed or barn, together with the engine and dynamo, the battery is all right, but not a quarter of a mile away. The cost of a 110-volt battery big enough to supply five houses would be prohibitive, especially when one considers he will have to replace this battery in two years.

STUDYING THE COST.—But these five neighbors have an alternative. Let them figure how much current they would use, altogether, from dark until bedtime. I should say two or three horse-power of electricity would be more than ample. Let them find out how much gasoline it takes by the hour to keep an engine running under this load; divide the result by five and they would have the cost of electric light. Then when they wanted current for ironing, the engine could run on certain hours on ironing days. I believe it would be very cheap, much cheaper than oil lamps, and much better, of course. There are generating sets, consisting of a gasoline engine directly connected to the dynamo, on the market, that are both cheap and efficient, and require little care. A boy could be the engineer. There is something about things electrical that appeals to a boy. Electricity is more natural to the average boy than going swimming. I know boys of 12 and 14 years, who can learn more about electricity in a week than I can in a year. I don't



A NEW HAMPSHIRE RYE FIELD; AVERAGE HEIGHT SIX FEET. Fig. 656.

know why it is; it is so. Maybe the boy can tell why.

STANDARD VOLTAGE.—Whatever you do, if you can avoid the use of a storage battery, use a machine of standard voltage—that is, a machine that makes electricity at a pressure of from 110 to 125 volts. Engineers who have spent their lives at the task have found this to be the best all-round pressure for domestic uses, and manufacturers who make lamps, stoves, irons and toasters have recognized it, by making all their instruments to fit this voltage.

THE WATER WHEEL.—Those who have water wheels, or can club together with neighbors to put an old water-mill in their neighborhood in commission, have the question solved. Then it is only a question of making sure that the wheel runs steady. Connect your dynamo to the wheel by an endless belt; bring the dynamo up to the rated speed: turn the regulator (supplied with all machines) until the indicating needle touches the right voltage (say 110); and go away and forget it, until time comes to oil it again. It won't need to do anything but spin until you turn on a light in your house or barn. Then automatically, the machine instantly generates just enough current to supply that light —or lights—whether it be one or one hundred. The wires carrying the "juice" from the mill to the house should not be less than No. 8, if the run is less than 1,000 feet; if over 1,000 feet, a bigger wire is better. The wire is of copper, and covered with weather-proofed tape.

SHORT WATER SUPPLIES.—One man says: "I have a stream on my place which dries up in Summer. Otherwise I would put in a plant." If I had a stream on my place that gave me power eight months in the year—the dark months, by the way—I certainly would burn lamps and candles four months, and enjoy electricity for the other eight. Electric lights for eight months is better than oil lamps for 12. Another man says: "I could enlarge my mill pond so as to have enough water during the dry season. Would this be better than to put in a storage battery, so as to run the wheel only part of the time?"

It would, most certainly. If he enlarges his pond, he won't have to throw it away at the end of two years and buy another pond. But if he buys a storage battery, he will have to buy a new one at the end of two years. I suppose the manufacturers of storage batteries will deny this is a disadvantage, but I have talked with engineers who know, and they admit it. The whole thing in a nutshell, for the poor man, is, if you want light only, and have power only part of the time, put in a low-voltage battery to store the "juice." But don't think you can enjoy heat and power too. Small batteries aren't built for that, and big ones are costly.

EXCEPTIONAL CONDITIONS.—The conditions under which we operate our plant are exceptional, I admit. We are on a river on which a steady flow is maintained by means of reservoirs, for power companies down below. The water goes by our house and we put it to work. It earns its keep. It does our lighting and cooking, and small-power jobs —turning separator, grinding axes, pumping water, etc. We are planning to go further. The next thing I do will be to put in an attachment on the kitchen boiler to keep the 40-gallon tank sizzling hot 24 hours a day. Then I am going to put in a hot-water heating plant, with an auxiliary for electric heating of the water. I think about five horse-power will keep the house warm all but the coldest days. Then I can build a wood fire in the fire-pot. But for six months during the Winter, I figure I won't need to burn wood. That heat won't cost me a cent, and I won't have to buck wood and split it, and take care of ashes. It may take more than five horse-power, or it may take less. Whatever it requires, the average water wheel can supply all the power needed, especially in Winter when the river is full.

THAT ELECTRIC PLANT.—"How can I operate my electric plant without storage battery so that the voltage will remain constant, no matter what the load?" P. R. A.

Massachusetts.

By using a "compound-wound" dynamo. This type of machine is self-regulating. There are three types of direct-current machines in general use: First, the series dynamo, used for street lighting, and other purposes where high-voltage is required. This is not to be thought of for a farm plant. Second, shunt-wound dynamo; this machine requires constant attendance, to regulate the voltage to suit the varying loads. If the voltage were right when all lamps were turned on, it would be too heavy when half of them were turned off, would burn them out. If it were right for half the lamps, it would fall too low for all the lamps. A shunt machine is not satisfactory for a farm plant. Third, the compound-wound dynamo. This machine is a combination of the series and the shunt machines, and automatically adjusts itself to the load, therefore it requires no attention as to voltage regulation. A modern compound machine will give the same voltage for one light or 100, therefore it can be run 24 hours a day without attendance.

"What size electric motor would be necessary to do the work of a 12 horse-power steam engine? How many horse-power could an electric line that carries 110 volts produce?" C. J. B.

Pennsylvania.

A 12 horse-power electric motor would do the same work as a 12 horse-power steam engine. Asking how much power a 110-volt line can produce, is like asking how much water a pipe carrying 110 pounds pressure could produce. To determine how much water you could get out of that pipe, you would have to know first how much water was behind the pipe, and second, how big the pipe itself was. The same with electricity. Electricity is generated by dynamo, and a wire leading from a dynamo could not carry any more power than the dynamo could develop. Some dynamos generate over 20,000 horse-power. F. I. A.

A CURSE OF RABBITS.

I HAVE read in THE R. N.-Y. a good deal about rabbits destroying trees and ornamental shrubbery. I had a tree killed by them only a few days ago. They are so thick around here that one could count up a dozen holes inhabited by them on one line fence. There are hunters with dogs around here, but they never have the luck to kill any rabbits, for they stay in holes days, and nights they go out. It is very seldom that I catch a rabbit with a trap. What would a person have to do so that the law could be changed so as to permit the use of ferrets for a short time in the Winter? C. H. M.

New York.

This rabbit question is one of the unfortunate points in the New York game law. The only things that can be said in favor of the rabbit as a game animal are that he is easy to kill and that he cannot be exterminated. If one or two pairs are left alive on each square mile by Spring the supply the next Winter will be as great as usual. Such close hunting as this is, of course, impossible over any extended area even if unlimited use of ferrets is permitted. If it is desirable to please those who may fear they will not be able to kill all they can carry each time they go out it can be done surely by shortening the open season and prohibiting the sale of wild rabbits.

I was living in New Hartford at the time the use of ferrets in Oneida County was stopped, and well remember an article that appeared in a Utica paper at that time. The writer stated that he had hunted all over New Hartford and parts of the neighboring towns, and had not seen a sign of a rabbit. His opinion was that rabbit hunting should be stopped for at least two or three years. At that time I could get rabbits enough for a meal or two every time I went out; that is, on each good tracking snow, without the use of dog or ferret, and usually in much less than a half day. There was then, and I suppose still is, a patch of woods less than five miles from the Utica court house where I never hunted because the rabbits were too numerous. I have seen an area of several square rods tramped down by the rabbits in one night so that hardly a single separate footprint could be found. It was as though a band of sheep had been there.

Now as to relief in this case. The conservation law reads: "The use of ferrets is at all times prohibited, except that the Commission may by resolution permit ferrets to be used in particular counties. The owners or occupants of inclosed or occupied farms and lands or a person duly authorized in writing by such owner or occupant may take, except by use of ferrets, in any manner at any time and in any number varying hares and cottontail rabbits which are injuring their property." Therefore, the first thing to do is to apply to the Conservation Commission for permission to use ferrets in Oneida County. Get all your neighbors and all your farmers' organizations to back you, and even then you will probably fail. While you are trying to get a chance really to fight the rabbits make use of all the means you have to keep them down. Get all your neighbors to authorize you to kill rabbits on their land. Set steel traps in all the rabbit holes, two or three in each entrance to every hole where you feel sure there is a rabbit. Stop up all other holes. Set traps or snares in the holes where they go through fences or under brush heaps. A rabbit almost always uses the same hole in going through a fence. Go out every day there is a tracking snow and try to find out where each rabbit went and what he did. Always have a gun loaded and ready with you on these trips. It takes a great deal of time to make a worth-while reduction in the number of the rabbits on a good feeding ground. I should estimate that it would take not less than 10 days of seven hours each for two men with a good dog and a ferret to kill 50 rabbits in 25 acres of fairly open brush land free from especially hard hunting, such as ledges of rock or large brush piles, if there were only 50 there at the start. A. C. WEED.

FIGURING LUMBER IN STANDING TREES.

I HAVE 350 White oak and 115 Black oak, second growth. I wish to sell these trees as they stand. I have measured them in the tree waist high. I wish to know how many feet of lumber, board measure they contain? The trees are tall, will average two 12-foot logs to the tree. Here is the number of inches: White oak, 7898 inches; Black oak, 7200 inches. Would like it figured separate. The White oak is worth $50 per 1000, Black not so much. F. M. B.

Indiana.

The contents of trees, in board feet, is usually figured by Doyle's rule. This rule is to deduct four inches from the small diameter of the log for slab, squaring one quarter of the remainder and multiplying the result by the length of the log in feet. For example, to find the contents of a 12-foot log, 24 inches in diameter (inside the bark) at the small end.

24 in.—4 in. equals 20 inches.
20 in. by ¼ equals 5 inches.
5x5x12 equals 300 board feet.

Perhaps an easier way to get at the same result is to the state the rule as follows: From a 16-foot log deduct four inches for slab and square the remainder. For longer or shorter logs the contents would be proportioned to the length. In the above case it would be worked out as follows: 24—4 equals 20. 20x20 equals 400, for a 16-foot log. But a 12-foot log is twelve-sixteenths or three-quarters as long as a 16-foot log, therefore this log contains three-quarters of 400 board feet, or 300 board feet. If the log were 20 feet long it would contain 1¼ times 400 feet, or 500 feet.

Not knowing the top diameter of these trees I cannot apply this rule to the case in question. A common way of estimating standing timber is to estimate the length and the top and bottom diameters, and apply Doyle's rule, using the average of both diameters and the whole length of the tree. I have no tables at hand for estimating oak less than 60 feet in height. It seems probable to me that the correspondent has underestimated the height of his trees.

A very useful little book is the "Woodsman's Handbook." Bulletin No. 36 of the Forest Service, U. S. Department of Agriculture. I believe it is free, or at any rate the price would be nominal, and it may be had by addressing the Secretary of Agriculture, Washington, D. C. Of course, timber buyers will not buy timber on the basis of the log scale and the price of first class lumber. There is always some loss through defects that are not visible from the exterior. However, if one knows about how much timber he has, and also the market price for such timber, he will be in a position to talk business. It is a good thing, if possible, to get an experienced person to estimate the timber, for it is difficult for an amateur to estimate heights correctly and diameters without instruments.

CHESTER L. MILLS.

A SENSIBLE BACK-TO-THE-LANDER.

I WORK in a factory, but would like to start on my own account. My idea was to rent a small place close to the town, starting with poultry and maybe a hog, and a few beehives, and continue to work in the factory, so as to feel my way along a while with a view to start farming later on, provided I have the energy and intelligence. I would like your opinion of White Wyandottes, and what kind of an egg they lay, white or tinted? What color would bring the best price around here? W. T.

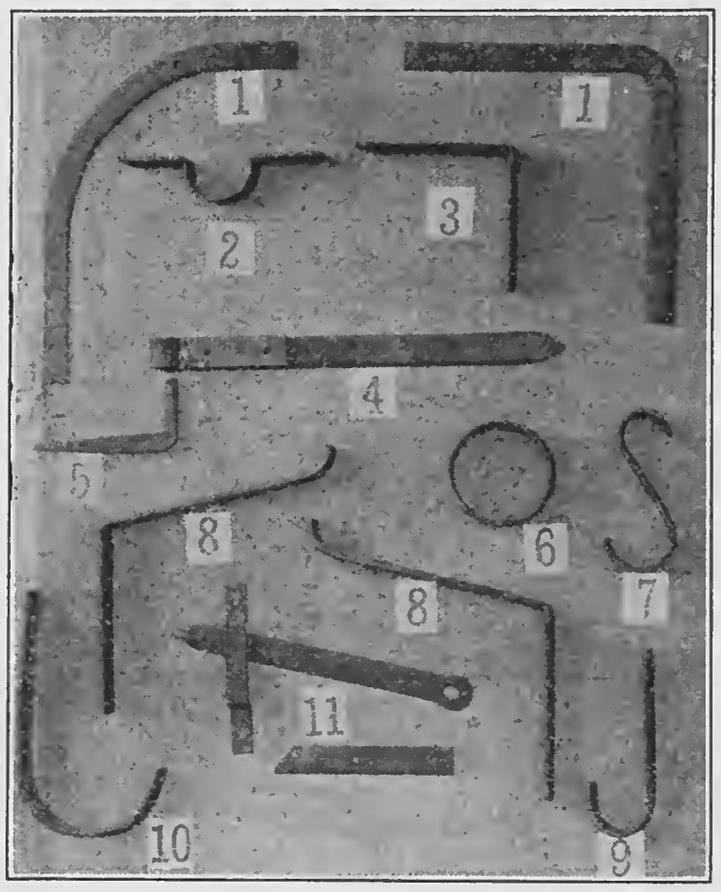
Rhode Island.

This is a very sensible suggestion, and it is to be regretted that more of the back-to-the-landers do not have the same idea about starting. This plan will enable you to find out whether you like living in the country or not. You could figure from what you get out of your rented place whether it would pay you to give up your town job entirely and put your entire time upon the farm. This sensible way of studying the question is to be commended to hundreds who write us about going into the country. What you say about finding out whether you possess the energy and intelligence required to make a living on a farm is excellent and good evidence of the last named quality at least. The White Wyandotte is an excellent breed. If you can get a start with the utility strain and obtain eggs or pullets out of a family noted for egg production, you will be well pleased with the Wyandottes. They lay a tinted egg, but this would not be an objection in your locality. While the New York market prefers the white egg, Boston and the New England cities generally prefer a brown or tinted egg, and will usually pay well for it.

EASY FARM BLACKSMITHING.

PART I.

NECESSARY KNOWLEDGE.—Because automobiles have become so plentiful and driving horses have gone out of use, many a black-



USES FOR OLD WAGON TIRES. FIG. 657.

smith shop lies idle, and the sounds from the village smithy under the spreading chestnut tree are heard no more. Thus many a farmer is forced to go a longer distance to have his blacksmith work done. Think of the time that might be saved if a part, at least, of this work were done at home! Any farmer who has some mechanical ability and who has a small building for a carpenter or repair shop, will do well to purchase a small iron forge and an anvil. He will be surprised at the great number of things that he can do for the farm by keeping the old horseshoes and old wagon tires that were formerly sold to the junkman. In making these easy and useful things for the farm, a knowledge of blacksmithing is not necessary. If you know how to make yourself handy at carpenter work, or if you know something about machine-shop work, or if you have confidence that you can do some of your own farm repairs, then go ahead, for the way is open, and many a dollar may be saved when nothing can be done outside during the stormy days of Winter.

HEATING IRON.—Work iron only at a white heat; use a red heat only for smoothing. Draw out or upset only at a white heat. Keep the iron high in the fire. Keep the fire solid, and rake over a little coke on top. Do not cool off the iron when it is at a white heat. The iron when at a white heat, if suddenly immersed in water, is crystallized, made brittle and unfit for further use. Do not pound the iron when black. It causes crystallization. Any such crystallization is broken by heating the iron red hot and allowing it to get black before cooling in water.

HEATING STEEL.—Have a slow fire with plenty of coke. Keep the steel high in the fire and heat only to a cherry red. Do not allow a scale to form upon the steel when it is in the fire. A scale formed upon the steel in the air does no harm. Cool the steel in the water only after it is black (hardening and tempering are different.) Do not pound the steel when it is black because it breaks the grain or crystallizes it.

FIRE BLACK.—Heat the iron to dark red and let it cool to a black; then dip in oil (fish or sperm) and wipe as dry as possible with cotton waste. Iron treated this way will stand a long time without rusting, even though exposed to the weather or water.

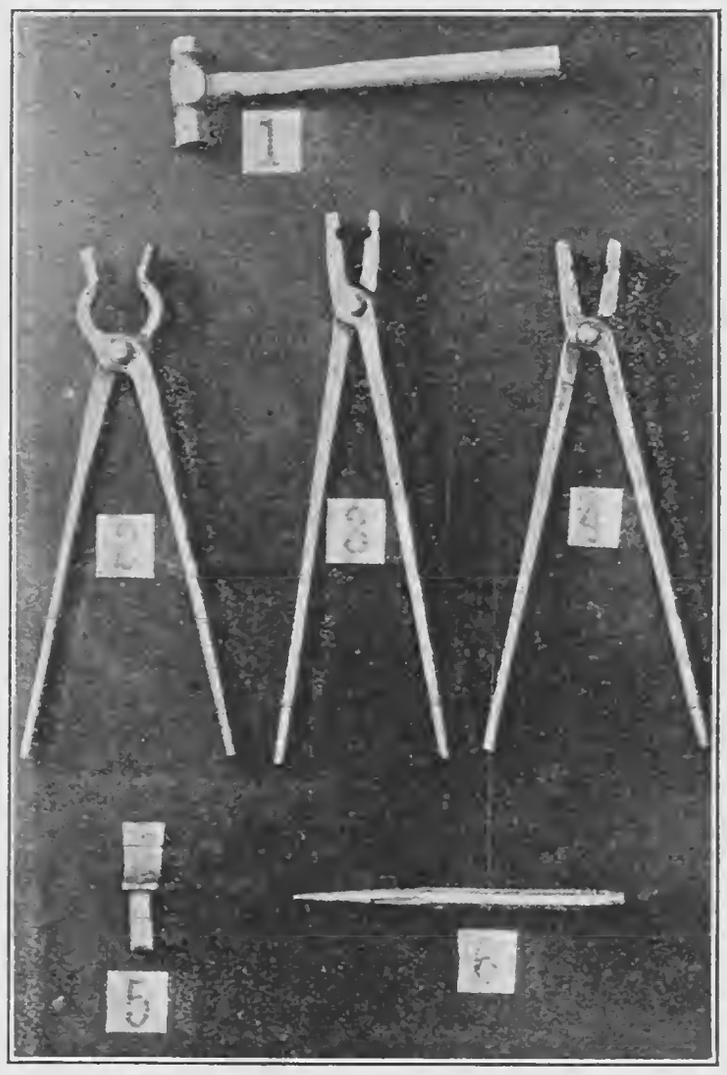
CASE HARDENING.—This is making a steel surface or skin on the outside of the iron. It is done so that it can stand all the better, where the wear and tear comes the greatest. Case-hardening is usually done with a deadly poison. It is placed upon the iron red hot, immersing the whole in water. The poisons generally used are cyanide of potassium and yellow prussiate of potassium. Care must be taken not to let any of the poison get into cuts or remain on the hands. The fumes are also very dangerous to inhale.

MOTTLING.—The same process and same poisons are used, for this process, except dot the iron here and there and swish around quickly in the water. The iron should have been made bright with emery cloth or fine file before heating for mottling.

TOOLS REQUIRED.—Fig. 658 shows the tools which a farmer should have to do plain blacksmithing: 1. A good carriage ironer's hammer, not over two pounds in weight. If anything heavier is needed get a sledge. 2. Tongs for holding square iron from ½ to ¾-inch diameter; very handy for other work. 3. Tongs for holding round iron or octagon steel, ½ to ¾-inch diameter. 4. Tongs for holding ¼ to 7-16-inch diameter, round or square iron. 5. A Hardee for cutting off hot iron or steel. 6. A steel punch about 16 inches long, ¾-inch octagon steel, for punching holes in hot iron. It is expected that any farm where a forge and anvil is worth while, has a good iron vise and a good grindstone. The more tools the better, but it should always be kept in mind that necessity will usually bring whatever equipment is needed.

USES FOR WAGON TIRES.—Fig. 657 shows some of the uses to which old wagon tires may be put. 1. Braces for shafts or wagon bodies. 2. A stake holder for wood or hay wagon. 3. Brace to strengthen any corner. 4. Hinge for barn door or gate. 5. Butt of hinge, made from half a horseshoe to go with No. 4. 6. Welded ring to be used when driving a post or on a beetle. 7. A strong S-hook that can be used for any purpose. 8. A hook to hold harnesses or shovels. Used in pairs or singly. 9. A hook to hold a shovel by the handle. 10. A harness hook. 11. The parts of a latch for a gate.

USES FOR OLD HORSESHOES.—Fig. 659 shows what a blacksmith can do with old horseshoes: 1. Ordinary horseshoe. 2. Horseshoe made to hold the ends of a ladder. 3. Horseshoe ends pointed to drive into a post to hold bars. 4. Butt of gate hinge, made from half a horseshoe. 5. Hook for harnesses, ladders or shovels. 6. Brace for farm wagon body. 7. Square-head bolt made from half a horseshoe. 8. Pin for pole or a longer pin, to help hold in tailboard to tip-cart. 9. S-hook for mending chain. 10. Welded ring, used with chain and crowbar for hitching out cow. 11. Chain hook for stone chain. 12. Parts of a whiffletree; ends made from half a horseshoe, centre from whole shoe; the wooden part of whiffletree sawed from two-inch plank.



TOOLS FOR FARM BLACKSMITHING. FIG. 658.

GARDNER B. WILLIS.

BRINGING BACK NEW HAMPSHIRE LAND.

AS much has been written in regard to the abandonment of New Hampshire farms, giving as a reason the sterility of the soil, and the inability on this account to compete with western production, I take pleasure in sending you a photograph showing what result can be accomplished by proper fertilization and care in growing grain, even on what would be called the most unpromising and sterile soil. I will give a detailed account of how this result was brought about and what other crops by proper rotation added to the four acres devoted to this test. The first crop harvested before any attempt at improvement was made was less than one ton of wild hay and witch grass. Immediately after harvesting the ground was plowed, and well manured with barnyard manure, which was well harrowed in, and seeded with millet about the middle of yielding a crop of five tons about the middle of September. After which the ground was again plowed, harrowed and given another light dressing again with barnyard manure. That Fall it was sown with rye, and seeded down the following Spring with Red clover and Timothy. The rye came up finely and reached an average height of six feet, with a maximum of length seven feet nine inches, as shown in Fig. 656. The yield was 12 tons of rye for the four acres, which was harvested about June 25, and as the field had been seeded down it yielded a second crop of five tons of rye, clover and Timothy, which made fine feed. This is conclusive evidence that the soil of New Hampshire under proper conditions can be made to pay a good profit in itself, as also other industries can be added which will materially add to the income of the farm and dairy product, chiefly the taking of Summer boarder.

Merrimack Co., N. H. ELMER TROMBLY.

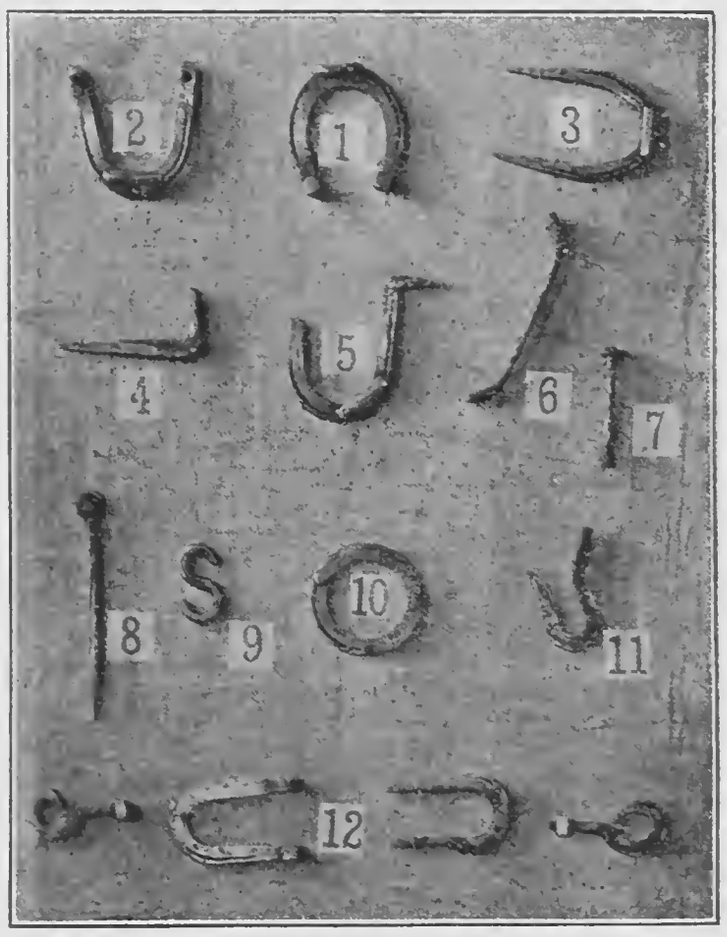
R. N.-Y.—No doubt almost any soil can be made productive by using a liberal dressing of manure. The usual back-to-the-lander has no stock or dairy and it would be difficult to buy manure. He will want to know what to do with that soil in order to grow the fodder from which the manure is made. We have found a good coat of lime on plowed sod well worked in oats and peas with fertilizer a good way to start. Then may come buckwheat and rye to be plowed under with corn to follow them. We know of cases where such land was started with lime, green crops and chemicals and finally worked into rich clover and dairy farm land.

A SHORT COURSE IN AGRICULTURE.

I DESIRE your advice on a question of policy for a young man. This young man is an orphan, 18 years of age, of good stock, has abounding health and strength, is intelligent, clean and steady as a clock. To the age of 15 he lived with his grandmother and aunt in the country; since then has worked for two farmers, this year getting $25 per month and board for the year, always giving satisfaction. He is saving his money and as "the call of the land" is in his veins, he is determined to make farming his life work. I had previously advised him to make the best farm hand he could and work by the year for the best practical farmers (or dairymen, as his tastes run that way) he could find—this as a means of getting his education. But I realize that just at this period of his life, a little special training might be better than all practice in shaping his career, and might make of him a broader man and far better farmer. He has been asking me about a short six-weeks course at Cornell this Winter, and I am at a loss what to advise him. It would mean the loss of nearly $50 in wages in addition to the necessary expenses of the course. He has only a good common school education, but is quick to learn. Now, in view of all the above, what would you advise this young man to do? C. W. V.

New York.

It all depends on the young man. Taking your statement of the case, and knowing nothing more about it, we feel inclined to advise this young man to take the short course at Cornell this Winter. He has adopted the ideal plan of working out as a hired man first—learning the practical side of farming and then building his education upon that. Too many young men work in the other direction—studying at college first and then trying to learn the practical. This plan is much harder than the other. One can graft agriculture upon farming much easier than he can work the reverse practice and use agriculture for the stock. This young man will get a good taste of scientific education in the six weeks and he will be able to decide whether it will pay him to go back and get more. What he gets at Cornell will be worth more than the money he will lose in wages. At the end of it all, however, it is "up to him." Our advice would be to try the short course.



ARTICLES MADE FROM HORSESHOES. FIG. 659.

FARMERS' CLUB

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see whether it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

BEES AS POLLEN DISTRIBUTERS.

I HAVE noted some recent comments in THE R. N.-Y. relative to the agency of bees in the polination of orchand fruits and the consequent fruitfulness of the orchard. It is significant that those who have given the matter careful scientific study are practically unanimous on two points namely, that most varieties of orchard fruits require cross-pollination for best results, and that insects, and especially the honey-bee, are by far the most important agents of pollen distribution. The most extensive studies of orchard pollination have been carried on in the West, especially by Prof. Lewis, of the Oregon Experiment Station at Corvallis, who has shown that the pollen is not transmitted through the air to any appreciable extent, and that the great majority of varieties are self-sterile to their own pollen. He has also shown that self-fertile varieties are usually improved by cross-pollination, and that certain varieties are much better pollenizers than others.

My own observations, carried on in the State of Washington during the past three seasons, confirm in a general way the results obtained in Oregon, though there are many differences in detail, indicating that locality and surrounding conditions may influence the fertility of a variety. Furthermore, results differ slightly from season to season in the same locality. It would take too much space to describe specifically any of these experiments. Those interested should go to the original sources of information. I have no doubt that bulletins or circulars on orchard pollination may be obtained upon application to the Director of the Experiment Station at Corvallis, Oregon. My own observations had also been written up in the form of a bulletin which I understand is to be published by the Washington Experiment Station some time during the Winter or Spring. Persons desiring to receive a copy when issued should apply to the Station Director at Pullman, Wash.

New York. W. J. YOUNG.

A SLAT AND WIRE FENCE.

IN reply to A. H., page 1393, I wish to say he does not need any machine to build slat and wire fence, if he will stretch his wires by hand the entire length of fence needed and leave enough for the slats to take up, say 16 inches for every rod of fence. Use three double strands of 14-gauge wire, stretch, and staple tight every four rods; that is, stretch just what you can pull by hand and drive staple tight, then begin at corner, insert slat, and with wooden mallet drive slat up to post. Then take the next slat in one hand and with the other cross the wires once, beginning at top and slip slat down until even with the first one, and drive toward the first slat until you have the spacing the right size. Repeat as before only cross the wires back the other way. If the land is not humpy lay a short piece of board on ground under the slats, which will act as gauge to keep of uniform height. As soon as the fence is completed to the next post, staple at once; the slats will take up the slack wire very fast so that one has to give more slack. To do this take hold of wires about half way from last slat to where the wire is stapled; give a quick, outward jerk, and you will have the slack needed. Repeat as the slats take up the slack. One has to pull staple to allow one to pass with the weaving. It is well where the corners are to have an idle post set in line with fence and about 10 feet off from turn to staple wires to, which allows one to weave up to corner. After a person gets the hang of it he can build 20 rods or more a day, but let me say a few donts.

Don't use lath; they are too thin; use one-half by two inches of any timber handy.

Don't forget to brace the corners well as this fence catches lots of wind.

Don't use less than three double strands of wire; better use four and don't use this fence if you don't want big snow drifts but for a chicken fence or garden where you want to hold the snow it is the best fence yet. It is cheap, durable and looks well, and will turn any kind of stock if well erected, and also it can be made portable by simply twisting the ends of the wires tight when taking the fence down. It will roll up as easily as woven wire fence, and is as light as the same height of fence. G. L. HUEY.

Michigan.

THE FARM MANAGER PROBLEM.

I AM very much interested in the discussion you have opened as to a farm manager's guarantee to make his wages and a reasonable profit for the owner. I have long cherished an ambition something like this. I hope to retire some day with about $10,000 to invest. This I would like to put into a farm; hire a manager who would guarantee to make his wages and six per cent. on my investment, and allow no depreciation in the farm or its equipment. Incidentally I would like to build a home for myself on a corner of the farm and buy my produce from it at first cost. Is such an ambition possible of realization. I greatly appreciate effort to encourage such agreements between owners and managers. CHARLES R. LICHTE.

Pennsylvania.

I was particularly interested in a recent editorial regarding the relations between the city owner of the farm and his tenant. While there is, of course, much to be said on his side, I must confess that I side with the tenant as a result of my observations of the dealings between the two. In my country (Southern Pennsylvania and Maryland) as a rule, the city man buys a run-down property that has, in most cases a splendid view, or a historic house, etc. He then proceeds to lavish money in order to bring the land up quickly. The tenant then finds that most of his time is taken up with hauling fertilizers, etc., the planting of trees and beautifying the grounds. As a result he has very little time in which to do his regular farm work. Without consulting the tenant, the owner will order lime, or some fertilizer when the corn needs cultivation; the hay, cutting, and the wheat harvesting. Sometimes he will buy purebred cows or sheep and place them in the charge of a tenant who is inexperienced, or is only accustomed to caring for scrubs, and then wonders why disaster results. I know of an owner who had his patch where he was trying to get a stand of Alfalfa heavily fertilized with acid phosphate, against the tenants advice, and refusing to top-dress heavily with lime. He now very positively declares that Alfalfa will not succeed in his region. I know a number of young men who would be only too glad to have the opportunity that S. R. mentions in his letter on page 1344. He should have little or no trouble in getting one.

Pennsylvania. C. B. M.

As a farm manager I want to reply to S. R.'s query and editorial comment on page 1344. I believe it is a question of the profitability of his farm. Some city men, by inheritance or unwise purchase, own farming property on which it would be impossible for any man to make interest on investment and good wages for himself. The land may be poor, the buildings too expensive or farm too far from markets. However, the owner has farm on his hands and wants a manager who will do the best he can with it. He offers a good salary realizing that his returns are larger or rather, his loss is less with a good man than a poor one. Can you blame manager for taking such position in a salary, or can you expect him to guarantee a profit where none can be made? However, if farm is all right I would be willing to undertake management as he suggested, if he has good size, fertile land, good cows and convenient markets. Personally I would prefer some cash crops in addition to milk. Under these conditions I would prefer a good proposition on share of net proceeds to an unprofitable farm on a good salary. In former arrangement owner should get man in whom he has confidence and leave details of management to him. L. M. H.

On page 1344, S. R. asks: "Could men be found to take charge of a farm, stocked and machined, and guarantee to make their wages and a fair percentage for the owner?" You say, "Why not?" and so say we. I cannot speak for others, but if S. R. has a farm that has been stocked intelligently, and the soil is in good heart—not run down—with a fair per cent. of tillable land. I will undertake to make it pay a profit over and above all legitimate charges, my wages included, or will manage it for a share of the profits. Most competent farmers own their own farms, but occasionally one has gone to town, tied up his available capital, and when he desires to go back to the soil, cannot buy such a farm as he would be satisfied to cultivate or force his family to live on, and prefers to manage a good farm rather than own a poor one. There are business farmers and professional farmers. From the uniform losses of the city farmers, we surmise that many farm managers belong to the better class, alone. A combination of both brings the maximum of success.

Virginia. H. L. M.

Joseph G. Harrison, of Berlin, Md., widely known as a nurseryman, died December 14, aged 74.

Mr. Harrison was born in 1840 in lower Sussex County, Delaware. In 1883 he and his family moved to North Carolina, and there engaged in the lumber business. He came to Berlin, Md., in 1884 and engaged in fruit growing. He was one of the pioneer orchardists of the peninsula and developed the business to a high degree. Five years later he, with his two sons, Orlando and George A. Harrison, started a small nursery, which has been enlarged from year to year and now is known as Harrisons' Nurseries. For the past twelve years the active management of the business has been in the hands of his two sons, who will continue as heretofore.

COMING FARMERS' MEETINGS.

Farmers' Week, Pennsylvania State College, December 28, 1914, to January 2, 1915, State College, P. O., Penn.

Farmers' Week, New Jersey State College, New Brunswick, December 28-January 2. Rural Life Day, December 28; Soils and Crops Day, December 29; Livestock Day, Dec. 30; Boys' and Girls' Day, Dec. 30; Poultry Day, Dec. 31; Horticultural Day, Jan. 1; Nurserymen's Day, Jan. 2.

Winter short courses, University of Vermont, Burlington, Dec. 28, 1914, to February 26, 1915.

Farmers' Week, West Virginia Agricultural College, Morgantown, Jan. 4-9. Winter short courses open Jan. 4, and continue nine weeks.

Fruit Growers' Association annual meeting, Rochester, N. Y., Jan. 6-7-8, 1915.

January 9th to 15th, inclusive, 1915 Mid-Winter Exposition, State Fair Grounds, Columbus, Ohio, Corn, Apple, Dairy and Poultry Shows combined.

Annual farmers' short course, Purdue University, Lafayette, Ind., Jan. 11-15, 1915.

Massachusetts Fruit Growers' Association annual convention, Horticultural Hall Worcester, Mass., Jan. 13-14, 1915.

Co-operative Associations of the State of New York, second conference, Utica, January 13, 14, 15, 1915.

Virginia State Horticultural Society, nineteenth annual convention, Winchester, Va., January 13-14, 1915.

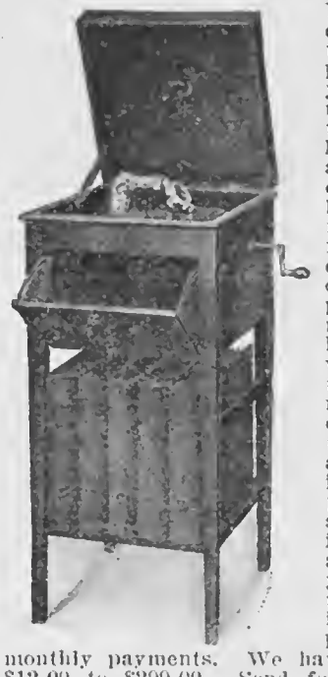
Georgia State Horticultural Society, Athens, annual meeting, Jan. 19-20.

New York State Agricultural Society 75th annual convention, the Capitol, Albany, N. Y., Jan. 20-21.

Vermont State Poultry Association, eighteenth exhibition, St. Albans, Jan. 19-22; secretary, M. D. Jarvis, St. Albans.

New York State School of Agriculture, Morrisville, Farmers' Week, Jan. 25-29.

FREE LOAN
OF THIS WONDERFUL PHONOGRAPH
Listen to your favorite music at our expense



You can try for ten days at our expense this wonderful graphophone. It plays your favorite dance record, song, waltz, two-step. You can hear grand opera or a vaudeville show or your favorite hymn, and there is nothing more restful after a hard day's work than the quiet enjoyment of pleasing music. The machine we show herewith is the most wonderful proposition in a talking machine ever offered. The special introductory price after ten days' trial is only $46.40 complete, with twelve selections. You try it ten days. If you are satisfied it gives you the most beautiful music you ever heard, keep it and pay for it in small monthly payments. We have other sizes, from $12.00 to $200.00. Send for complete information. You do not have to send a penny until the machine is tried and you find you wish to keep it.

5 Days' Free Trial

This famous "Hotpoint" electric iron will be sent to you to try. Within 5 days you send us either the price, $3.30, or the iron by parcel post, and we will refund postage. Simply write us now, with your business or personal card, or on your letterhead, without enclosing money. Then, after trying iron, send the three dollars and thirty cents by check, postal or express order. Or, if you don't keep iron, we pay charges both ways, so you lose nothing.

This Electric Flatiron

saves half the time and fatigue of ironing. As its point stays hot, you needn't journey to the stove to change irons. You simply tip it up on end on its fire-proof attached stand, without that constant lifting onto separate stand, and without any holder because handle is always cool. Exact regulation of heat prevents scorching, and neither waxing nor cleaning is necessary. Attach to any electric light socket in any room or porch.

Jump at this opportunity to secure latest model of standard electric iron at very low special price, $3.30. An ideal gift. Write right now.

"SUPERB" Everbearing **Strawberries** a success. Circular Free. WILLARD B. KILLE, Swedesboro, N. J.

Strawberries in November.

BY picking the blossoms off the vines of a third of an acre strawberry patch in Northern Michigan this year, the grower put back the picking of the fruit clear out of season, and sold his berries at a price far in advance of the season prices. After this kind of fruit disappeared from the market, the Michigan man picked nearly 800 quarts, and during the first three days of November he harvested and marketed a bushel of the most luscious berries ever brought to this market. They sold at 25 cents a quart basket wholesale. The patch is near Boyne City. This was accomplished from plants set out in May, and the blossoms were picked off until the last part of July. The accompanying picture, Fig. 660, shows the harvest going on in November, and a watermelon and a ripe pumpkin of this year are shown with crates of strawberries that have just been picked from the vines. W. F. Tindall was the grower. J. L. GRAFF.

A PATCH OF NOVEMBER STRAWBERRIES. FIG. 660

Greenhouse Propagation of Blackberries.

CAN blackberries be propagated at this time of year in a greenhouse from root cuttings, and if so what method would you use? B. T. H.

Blackberries can be very readily propagated from root cuttings in the greenhouse during the Winter months. The method of procedure is very simple; it consists in cutting the roots in pieces one and a half to two inches long, which may be forced into growth either in flats or the greenhouse bench. In either case, a depth of about two inches of good soil should be placed in the flat or bench, on which the root cuttings are placed in a thin layer and covered about one inch deep with good soil. If the root cuttings can be given mild bottom heat, the breaking into growth will be somewhat hastened; ordinarily it requires four to five weeks for top growth to appear. When the top growth is three or four inches high the plants should be potted off and carried along in mild heat until Spring, when they can be transferred to the open ground. Nurserymen frequently resort to greenhouse propagation of new and rare sorts, but very rarely propagate under glass the old varieties that sell at a low price. The root cuttings of these are made in the late Fall, packed in small boxes of sand and stored in a cool cellar until Spring, when they are scattered thinly in shallow trenches or furrows and covered about two inches deep. With good clean cultivation they will make good marketable plants by Fall, but not quite as strong as those started in the greenhouse during the Winter. K.

THE OHIO "CORN BOYS."

Their Visit to New York.

PART II.

A TRAVELED FARMER.—I approached a man whom I believed to be a neighbor back in Northeastern Ohio. He looked at me strangely but gave me his name, and I later learned much of interest about him. A farmer boy 45 years old is Charles Bates of Sandusky, Ohio. He has worked out on the farm by month and day all his life, and he just went along with the boys, to be a boy again. This is not his only trip, I was informed, for Mr. Bates out of his earnings has traveled around the world. The trip round the earth cost him over a thousand dollars of his earnings, and "it was worth it," he said.

A FARMER AND HIS TENANTS.—"A day with the corn boys will not be worth while until you see Colonel G. W. Brecount," one of the Commissioners of Agricultural Education said, and Secretary Sandles remarked. "He owns all the land around him." Colonel Brecount was seated on the upper deck of the big ferryboat, talking to one of his tenants. There were six of them on the trip and he paid their way, every cent, and it has paid him. Mr. Brecount was with the boys a year ago, and there was not a happier boy on the trip. The night of his return he invited the tenants and their wives to come in, this time after supper, for when the tenants come to supper in the Brecount home, the picnic and dishwashing last long in the evening. This occasion Mr. Brecount told first to the little folks the interesting things he saw on his trip, and after the little boys and girls were tucked away on the big beds in the Brecount house, the Colonel told of the great things which would interest his men. "You have treated my son and me pretty good," Mr. Brecount said, "and in 1914 I am going to take you all along." Mr. Brecount brought with him more corn boys and girls from Miami County than any other county, 79 boys and girls. Mr. Brecount not only finds time to manage his farms, but he is father not to one boy, but to corn boys and girls all over Miami County.

OTHER NOTABLES.—Arnett Rose, aged 17, of Allen County, Ohio, and twice champion corn grower was a center of admiration among the boys. Rose is a tall sturdy chap, nearly six feet in height, and Lima, Ohio, people gave him a beautiful gold medal for his yield of 153 bushels and 47 pounds of shelled corn to the acre. Merle May, a boy of 14 years, ranked second, with yield of 143 26-56 bushels an acre. Miss Hazel Thompson of Port William was one of the highly honored on the trip because of her leadership among Ohio girls in sewing, cooking, baking and preserving. The boys from the northern part of the State took particular pride in advertising the success of Harold Dester, who lives on the Lake Shore near Cleveland, and who raised 92 bushels of Pride of the North. Farmers in this section said it was not a corn country, but Harold has shown some of the older ones it can be. The men in charge of the excursion are well known in Ohio. Secretary A. P. Sandles is known as the man who brought the rainbow down in the Buckeye State; T. P. Riddle, prominent as a business man of northwestern Ohio, was the first to conceive of the trip. The trains were under the direction of Commissioners S. A. Harbourt, Cleveland, H. L. Goll, Swanton, J. R. Clark, Columbus, Lester H. Ivins, Lebanon, Mrs. J. E. Russell, Sidney, and Mr. W. E. Brecourt, Conover. It was after midnight when the last boy filed through the gates of the great Pennsylvania station in New York all happy in the thought, "I am now bound for Ohio." W. J.

Rental for Farm.

WILL you please advise me as to rent that should be paid on a farm of 75 acres? Eight good milch cows not over five years old are left on the place. Buildings are in good repair. The soil is a sandy gravel and is quite deep. The farm is well kept up and good crops have been harvested. The milk is to be sent to a cheese factory, two miles away. The place is three miles from railroad station. I have to pay water rent and school tax which amounted to $29 this year. C. A. R.
Niagara Co., N. Y.

This question was submitted to a number of farmers in Western New York. They made various estimates regarding the proper rent. These estimates run from $250 to $300 per year, with a fair average of about $275. Farmers generally have difficulty in figuring a cash rental, as most of the farms are rented apparently on shares as a general practice.

"I THOUGHT you told me that this would be a paying investment," grumbled the customer, as he handed over another assessment. "Well," replied the promoter, "you are paying, aren't you?"—Cincinnati Enquirer.

Ground Limestone 50c Per Ton

The day of cheaper lime is here. No need to let your soil stay sick and sour because of the lack of lime if you have lime rock available. No need to let acid land keep you from growing clover or alfalfa. With a Jeffrey Lime Pulver you can grind lime-rock right on your farm at a cost of 50c per ton! This does not include quarrying cost, which varies, but in some sections is almost nothing. Ground limestone is better than burnt lime. It doesn't burn up the humus or waste the Nitrogen in the soil.

Dig out those lime rocks that prevent your cultivating your fields. Feed the rocks to the Lime-Pulver, as large as you choose—any size up to 4 inches thick and 11 inches long. The rocks disappear in the hopper. Out of the funnel pours a stream of ground limestone—ground either coarse or fine. It's like turning rocks into dollars—"making bread from stones."

Grinds 2 to 3 Tons Per Hour
Grinds Rock for Road Work Too!

The Jeffrey Lime-Pulver is the machine that will take the big rocks that come from the quarry and grind them to a powder that will go through the spreader. It is both a crusher and a pulverizer—with twice the capacity of other crushers. Grinds from 2 to 3 tons per hour. Grinds rock for road work and concrete work—grinds corn on the cob, tobacco stems, bone or any similar material—a universal grinder, portable—as easily moved from place to place as a wagon. Built to last a lifetime—with pulverizing hammers of Manganese steel—ball bearing pulverizer. Sold on a guarantee of satisfaction or your money back. Write us today for our free booklet giving price and full information about the Lime-Pulver. Write NOW.

EVENTS OF THE WEEK.

DOMESTIC.—The New York Stock Exchange opened Dec. 12, after being closed for 19 weeks. The bidding was aggressive and there was an average advance over prices of July 30 of from 6 to 15 points, some stocks showing an increase of 20 to 25 points.

Seven persons were killed and nine injured by a blast of gas which rocked the entire west end of Cleveland, O., Dec. 14, and wrecked a two-story brick apartment and business block. Three families were practically wiped out of existence. The force of the explosion was such that the bodies of the victims were so mutilated that identification was a slow process. The explosion is believed to have resulted from an accumulation of gas from a leaky pipe in the basement.

Dec. 14 conditions at Naco, Ariz., were causing much uneasiness, as Mexican bullets continued to fly across the border. The announcement that Gen. Hill, commanding the Carranzista troops, which hold Naco, Sonora, had received two three-inch field pieces, sent him through the Carranza junta in Washington, has caused an inquiry to be made regarding the extent that arms are now being sent across the border. Although the embargo on arms was never replaced, at a number of customs points officials have simply held up arms and ammunition "pending inquiry."

Fire started Dec. 14 in a large theatre at Wilmington, Del., spreading to other buildings in the business section. Damage amounts to $100,000.

Indictments charging conspiracy to defraud by use of the mails by the sale of fire insurance in fake companies, chartered in Delaware, were found Dec. 15 at Wilmington, Del., by the United States Grand Jury against ex-United States Senator Richard R. Kenney and ex-State Senator Daniel M. Ridgeley, both of Dover, Del.; Frank W. Anthony, Dorchester road, Brooklyn; his son, Claire Webster Authony, 320 Broadway, New York; Harry A. Woodcock, 95 William street, New York; R. Frederic Brennen, of Brooklyn, and Benjamin D. Jacobs, alias Berka Donnell Jacobs, 195 West 109th street, New York. The two Anthonys and Woodcock, through ex-Senator Kenney, their attorney, formed these fake companies: Home Fire Insurance Company, American Fire Insurance Company, Mercantile Fire and Marine Insurance Company and Equitable Fire Insurance Company. The latter had its office here; the three others had headquarters at Dover. Dummy officers and directors were elected, says the indictment. The cases will be called in January. Brennen and Frank W. Anthony are now under $5,000 bail each in New York on this charge. The others have not been apprehended. The promoters, it is said, realized over $100,000 by their operations. Brennen and the two Anthonys, it is said, have served terms at Sing Sing and elsewhere for insurance and other frauds. Ex-Senator Kenney was tried twice in the Federal court at Wilmington in 1897 for alleged complicity with William N. Boggs, paying teller of the First National Bank, Dover, Del., in the embezzlement of $107,000 of the bank's funds. This was when Kenney was Senator. The jury disagreed both times. When the case was called the third time it was nolle prossed.

Seven buildings, a lighter and the barge Valentine were destroyed, Dec. 16, by a fire that started in the shops of McAllister Bros., ship builders, in West New Brighton, Staten Island. The damage is estimated at from $75,000 to $100,000.

THE EUROPEAN WAR.—Reports from Dover tell of an attempt of German submarines to raid that port Dec. 10; guns in the forts are said to have sunk one or more of the vessels.....The Turkish battleship Messudiyeh was torpedoed and sunk by a British submarine in the Dardanelles Dec. 13. The submarine was the B-11. In accomplishing the feat the little vessel dived under five rows of mines. After launching the torpedo which struck the Turkish warship the submarine escaped in spite of fire from the forts and pursuing torpedo boats.....The German cruiser Cormerant is interned for the war period at Guam by the U. S. authorities. .....The German cruiser Dresden left Punta Arenas in the Strait of Magellan. The British cruiser Bristol left also apparently in pursuit.....An official inquiry into the destruction of the British battleship Bulwark at Sheerness, on November 26, shows that the vessel was blown up by an accidental explosion of her magazine.....Dec. 16 a German fleet raided the English coast during a fog, bombarded the cities of Scarborough, Hartlepool and Whitby, on the Yorkshire coast, 310 miles from Helgoland, killed over 74 civilians and soldiers and wounded hundreds, destroyed an immense amount of property and escaped to sea. Men, women and children, of the civilian population, were left dead or wounded, struck without warning while at breakfast or at work. In all, the casualty list totals 224, according to the official estimates, of whom 74 are known to be dead. Three churches were damaged; the gas works and lumber yards at Hartlepool were set afire, and the abbey at Whitby was struck. One church was struck twice during an early communion service. Whitby and Scarborough are both unfortified seaside resorts. This operation of the Germans again brings up The Hague rule regarding the bombardment of undefended towns. Such bombardments are absolutely forbidden by The Hague conventions. Germany, France, Great Britain, Russia, Austria-Hungary, Servia and Turkey all signed these conventions.....Dec. 13-17 the Allies continued to advance in Flanders, having resumed a general offensive movement. Violent fighting has continued in the vicinity of Ypres and Nieuport. French gains are reported in the Argonne and in Alsace, except at Steinbach, where German success was reported.....Reports from Petrograd say that the Russians have won a heavy cavalry engagement southeast of Mlava, and that the Germans are in full retreat on their frontier. The latest official Russian report announces a successful completion of the operations around Mlava, and asserts that the Germans are in retreat. The news from the centre in Poland indicates that the German armies at Lodz and Lowiscz are at a standstill. Germany says of the situation in Poland that the operations in the north are taking their normal course and that there is nothing to report from East Prussia and from southern Poland.....Dec. 14 the Servians recaptured Belgrade after it had been held by the Austrians for 12 days

FARM AND GARDEN.—After due consideration it has been decided to hold the annual farmers' short course at Purdue University, Lafayette, Ind., January 11-15. It had practically been decided to abandon the idea this year on account of the foot and mouth disease. Conditions have improved to such an extent that the faculty have decided to arrange for the farmers' school as usual. One of the most important meetings of the week will be the session of the Indiana Corn Growers' Association. The meetings of the Indiana Dairy Association, Indiana Livestock Breeders' Association, Indiana Poultry Association and the Federation of Agricultural Associations will also be held during the week. One of the greatest features of the week will be Annual Corn Show, held in connection with the Corn Growers' Association.

During the past year the Agricultural Extension Department of the West Virginia College of Agriculture, Morgantown, has tried out the experiment of bringing the rural schools into closer sympathy with the life and interests of the local community, by providing a few district supervisors with funds to carry on community work on Saturdays and throughout the Summer vacation. This work has usually taken the form of corn club work with the boys' tomato growing and canning with the girls, and general community meetings for all.

The New York State School of Agriculture at Morrisville, N. Y., is to stage its best poultry show in connection with the fifth annual farmers' week January 26 to 29. The short course in poultry husbandry will be in session at the same time. This is a six weeks course, beginning January 4. The students will be seen carrying on the work of the poultry plant, such as managing the layers and breeders, killing and dressing roasters and capons, running the incubators, and doing other kinds of, practical work which is a major part of the short course.

The annual meeting of the Georgia State Horticultural Society, at Athens, Ga., Jan. 19-20, will be followed immediately by a meeting of the Georgia Apple Growers' Association.

The twelfth annual meeting of the South Dakota Improved Live Stock and Poultry Breeders' Association will be held in Mitchell the last week in January. The object of this convention is the betterment of live stock and poultry of all kinds within the State. It is the largest of its kind and probably there is more good done during this week for the production of new wealth in South Dakota than through any other association in the State. Fifty or sixty breeders combine and hold a two days' sale. Each man is allowed but a few head in the sale, and the total number to be sold is limited so as to afford each contributor sufficient time to make a few remarks if desired at the ringside. The State provides a large, commodious building, with a heated and electric lighted and comfortably seated sale pavilion. The program will begin on Tuesday evening, January 26, this year. On Wednesday evening a joint program will be held with the Corn and Grain Growers and the State Poultry Breeders' Associations.

A fight was begun before United States Commissioner Matteson, at Providence, R. I., Dec. 16, to prevent the commitment of Col. Frank W. Tillinghast, head of the Republican forces of Rhode Island; Leonard L. Barber and Samuel A. Fenner under the indictments found in New York for conspiracy to defraud the Government out of $500,000 taxes on alleged artificially colored oleomargarine. They were indicted at Providence and their plant was closed. Change of jurisdiction is being fought because of the alleged hardship it would impose on the accused men. Judge Brown reserved decision.

Assistant Secretary Byron R. Newton of the Treasury Department, has given the city authorities of Dallas, Tex., permission to use Federal property there for a free open market. The site is vacant property owned by the Government as site for a new Federal building. The site comprises an entire city square, and is situated near the principal residence section of the city, giving it an ideal location for market purposes. It was purchased by the Government a year ago for $250,000, and in the ordinary procedure would remain unoccupied until the Government is prepared to erect a building there several years hence. In granting permission to the Mayor and council of Dallas to use the site for market purposes it was stipulated that the market should be free and that the city should maintain proper police control of the place and keep it in sanitary condition.

SECRETARY HOUSTON'S REPORT.—In his annual report submitted to the President Dec. 10, the Secretary of Agriculture takes the position in discussing rural credits that there is no emergency which justifies government assistance to farmers directly through the use of government cash or credit. His statement was regarded as indicating the policy of the administration. Secretary Houston points out that the new bank law "takes just and particular knowledge of the farmers' requirements." He suggests that any credit needs of the agricultural community beyond those cared for under the Federal reserve law should be cared for by a system of "co-operative credit associations," financed with private funds, by means of which the combined credit of farming communities could be utilized, and by a system of land mortgage banks, also privately capitalized. In advocating a land mortgage banking system and a system of co-operative credit associations, the report asserts that the use of the funds loaned for productive purposes on the farms covered by the mortgages should be insisted upon. Mr. Houston's report reviews the investigation of the marketing and distribution system, and says that while the study is not sufficiently finished to admit of final conclusions the work thus far shows the need of a reorganization of the distribution process. Secretary Houston asks Congress for an additional emergency appropriation of several million dollars on account of the recent outbreak of the foot and mouth disease among cattle. "The interests at stake are vast," he says, "and justify any reasonable expenditure." The secretary recommends consideration of legislation to establish a permissive warehousing system for grain and cotton. He points out that the warehouse facilities for cotton in the South are not centralized. While the production of grain generally showed a great increase in the crop of 1914, the report points out the production of corn showed no advance, and the meat production showed a distinct decline. The secretary urges farmers to diversify their products, and especially to produce beef, swine and poultry, at least for home consumption.

AN Indian missionary, a visitor to New York, says that an Irish waiter at his hotel became rather confidential one day when things were unusually quiet. "He told me," says the missionary, "that in three years he hoped to return to the Emerald Isle and end his days in peace on the little farm that he was able to call his own—in extent about sixteen acres. Then he went on, 'Besides, yer Riv-rince, I want to go to heaven when I die, and that is impossible from New York.'"—New York Evening Post.

You Can Get Both Comfort and Long Wear When You Buy Rubber Boots

A long wearing boot is not hard to turn out. All the makers need do is to forget about comfort. A comfortable boot is simple to make. That can be readily done by forgetting long wear.

To successfully combine comfort and wear—that is a problem that most makers of boots cannot solve.

ELEPHANT HEAD RUBBER BOOTS combine durability and comfort. That's why they are the most popular boots in the world.

ELEPHANT HEAD BOOTS are made of pure gum rubber and selected first quality Duck. They are reinforced at every seam, joint and wearing point. Every one is lined with soft wool net.

All the better dealers sell ELEPHANT HEAD RUBBER BOOTS. You can depend on anything you buy in the stores that have them.

WOONSOCKET RUBBER CO., Woonsocket, R. I.

Soil Fertility Questions

Corncobs as Fertilizer.

ARE broken corn cobs used as a fertilizer of any value to the soil? If so for what crop, and how should they be applied? E. J. E.
Lancaster, Pa.

A ton of corncobs contains eight pounds of nitrogen, two pounds of phosphoric acid and nine pounds of potash—a little less nitrogen than stable manure. This plant food will not be of any use to plants until the cobs decay. Broken cobs would remain in the soil for a year or more without feeding crops, and are thus of little value as a fertilizer. The broken cobs would absorb considerable stable liquids or make a good mulch for fruit trees, but they are too slow to serve as manure.

Lime and Cover Crop.

I AM not a disciple of the theory that lime in some form is a panacea for all or most of the unproductiveness of New England soils. The constant decrease in the average production per acre of the newer lands of the West is not owing to the exhaustion of lime in these soils, but to the rapid waste of humus, with which the soils were originally fully stored. The same is true of the older soils of the Eastern States. Too many farmers are still trying the foolish experiment of producing something from nothing, a practice upon which nature has placed her everlasting embargo.
Connecticut. L. P. C.

R. N.-Y.—That last sentence is everlastingly true. You must remember, however, that in some cases you cannot hope to put humus into the soil at reasonable cost unless you use lime to start manurial crops. We have learned this in trying to build up a tough, hillside soil.

Commercial Value of Manure.

WHAT is chicken manure worth per ton, and what is the best place to dispose of about two tons a week? Is chicken manure, scraped from dropp'ng boards on which lime has been sprinkled, as good as that without lime?
White Haven, Pa. A. C. F.

In most localities the value of chicken manure is comparative, like that of silage. In the case of silage the fairest way is to figure that it is worth, ton for ton, about 30 per cent. of the price charged for hay in the mow. That seems to be the fairest way of estimating its value. In the case of chicken manure, fresh from under the perches, and without too much litter or feathers, it is safe to figure on a value of from three to four times as much as the local prices of stable manure. In most cases it is fairer to figure this way than to estimate the value of plant food which it is thought to contain. On this valuation in our own section such chicken manure would be worth $8 to $10 per ton, but in places where stable manure would bring only a dollar a ton, the chicken manure would be worth between $4 and $5 comparatively, unless you could find some one who would buy it on analysis. Do not under any circumstances whatever use lime or wood ashes on this manure. We have repeatedly given the facts about this. The lime in slaked lime and wood ashes will set free the ammonia in the fresh manure, and in this way you will lose at least one-third of its plant food value. Land plaster, ground phosphate rock, coal ashes or road dust will dry out the manure without loss, but never use lime or wood ashes. The only probable sale for the chicken manure would be to some local farmer or gardener. Why not advertise in a local paper?

Chicken Manure for Alfalfa.

I OWN 160 acres best bottom land, 90 acres in Alfalfa; will produce in ordinary seasons five tons hay per acre. I am getting four or five tons of fresh chicken manure a week delivered free of charge. How should I use this manure? Will it injure the Alfalfa? How much should I spread per acre, and what value is this manure to me, if any? J. A. C.
Winfield, Kan.

In most locations on the Atlantic Coast this manure would be worth $8 to $10 per ton. It is valuable chiefly for its nitrogen. This is the element which the Alfalfa least needs, since it can obtain nitrogen from the air. The chicken manure will stimulate its growth and somewhat increase the yield. When used in the East chicken manure is used mostly on corn or on garden and truck crops when mixed with chemicals. You can use two tons of chicken manure to the acre. If your manure spreader can be gauged to distribute this amount per acre use it. Or you can mix it with two or three times its weight of good soil or dry swamp muck and then distribute. Your Alfalfa will probably need potash and phosphoric acid with the manure. Can you not obtain corn-cob ashes? These are very rich in potash, and if you could use half a ton of the ashes per acre, not with the manure, but separately, you would have a good fertilizer.

Hen Manure for Potatoes.

IS chicken manure good for potatoes? If so, is it better to manure the land where they are to be planted, now in the Fall or in the Spring? F. M.
Connecticut.

Chicken manure is good for any crop. As it is rich in nitrogen it will give best results on these crops which produce mostly above ground—like corn, cabbage or grass. When used for potatoes it would be better to dry and crush the manure fine and mix with chemicals and then use like any fertilizer. Some growers plant the potatoes and drop a handful of the manure on each hill—hoeing it in. We would rather store the manure in a dry place over Winter and use in Spring.

Value of Wood Ashes.

WHAT are hardwood ashes worth a bushel or barrel for fertilizer; also soft-wood ashes? I wish to buy them from my neighbors and furnish each with a barrel to save them in.
New York. C. E. W.

Do not buy plant food by the barrel until you weigh several packages. Figure by the pound. The ton of average hardwood ashes will contain 100 pounds of potash, worth $5, 35 pounds of phosphoric acid, worth $1.75, and 500 pounds of lime, varying in value. The soft-wood ashes will be worth about 80 per cent. of this. Ashes from the average stove or furnace will contain some coal ashes and sand, which reduces their value. Usually a bushel of ashes weighs 40 pounds. Allowing for leaking and waste it is worth about eight cents.

A "Misfit Tree" Case.

I FIND this clipping in a local paper:

"Albion, Nov. 24.—The jury in the action of Watson H. Whipple, of Medina, against the Brown Brothers' Nursery company, of Rochester, returned a verdict at 9:15 last night, awarding a judgment of $405 to the plaintiff. The action was to recover $1,750 damages as a result of having purchased a quantity of peach trees of standard varieties, which, it was charged, proved not true to name."

Can you give us any further particulars about this? J. L.

Here is a statement of the case from the lawyer who tried it for Mr. Whipple:

The amount involved in this action is not so important as the fact that it discloses the position which the nurserymen are going to take in respect to the thousands upon thousands of trees which they have sold throughout this country and which have proven untrue to name. Mr. Whipple is a highly respected man here, and has the confidence of all concerned. Brown Bros. Co. was considered a responsible concern. In the Fall of 1909, Brown Bros. sent a man here by the name of Mull, of good personal appearance and taking manners, who succeeded in selling trees to friends of Mr. Whipple's. Believing that everything was open and above board, Mr. Whipple made a verbal agreement with him to buy his trees. Shortly afterwards, toward evening, he drove to Mr. Whipple's place in great haste, and presented an order to him to sign, stating that the company would not ship the trees on account of having so many orders, unless they had a written order specifying the kinds, to go by. Mr. Whipple, who did not have his glasses with him at the time, took Mr. Mull's statement about the order and signed it.

We brought our action upon the verbal contract which was the real contract, and when shown the paper which he signed, Mr. Whipple testified that his signature to it was secured by fraudulent representation. When the court permitted that question to go to the jury, they then set up the defense that Mr. Mull was only their agent to take orders upon a special order blank and that these orders must be approved by them. In other words, they had turned out upon the community a man whom they had held out as their agent, for the purpose of selling trees, but who, by some secret understanding with them, could only sell their trees upon an order which deprived any man who purchased their trees of any relief in case they proved untrue to name. This also did not work, and the case was submitted to the jury, which found a verdict in favor of the plaintiff.

This order contained the following clause: "Any stock which does not prove to be true to name as labeled, is to be replaced free or purchase price refunded, *but is not further warranted*," in fine print, so fine that an ordinary person could not read it without having the best of light and examining it very closely. At the top of it in large letters was printed the word "ORDER," from which a casual observer would think that it was simply an order to ship certain numbers of articles without any further provision.

The words "Not further warranted" were inserted in this order to cover the decision in Sanford vs. Brown Brothers Co., 119 Supp. 333.

In spite of the position taken by the defendant the plaintiff was successful. There are hundreds and thousands of these trees untrue to name sold throughout this fruit section. Mr. Brown himself on the stand testified that there was not a single tree in this orchard of Mr. Whipple's of the kind purchased by him. After spending five years of his life in cultivating, phosphating and caring for these trees, plaintiff finds himself with a worthless orchard upon his hands.

LEON M. SHERWOOD.

WEATHER AND CROPS.

We are having the longest spell of stormy weather I can recollect for this climate. No cold weather yet to amount to anything. Had fine lettuce from the open garden to-day for dinner, and have not touched that in the frames yet. Salsify is growing faster now than it did in the dry weather of early Fall, and the spinach is rank, and the late-sown spinach intended for Spring cutting is almost large enough to cut now. But with the heavy mulch of stable manure it will go through all right I suppose.
Maryland. W. F. MASSEY.

Dec. 1. The figures given are just what the farmers are receiving at wholesale here. Apples, No. 1, 75c. per bu.; poultry, live, 10 to 12; hogs, live, 5; beef, live, 5; wheat, best, $1.09; corn, 65; oats, 50 at elevators; potatoes, 40; onions, 60. C. D. R.
Battle Creek, Mich.

Nov. 30. Berries are the main thing here. Strawberries and grapes go out through our Fruit Growers' Association; strawberries, 8434 cents per 16-quart case; grapes, five cents per eight-pound basket. This is net all expenses, packages, etc., being deducted. Raspberries, $1.25 per 25-pint case; black raspberries, $1 per 16-quart case; blackberries and dewberries, $1 per 16-quart case, all net, the canners furnishing the cases. We do a little better by contracting these at the cannery. In shipping we receive all the way from $1.10 to $3, after cases, express, "cartage," "moldy"; our average on the season does not do as well. Our eggs we ship to customers in Chicago, four dozen by parcel post, 12 dozen by express; price per dozen from 25 to 40 cents, according to the season, we paying the express. Butter from 25 to 35 here at the store; we ship in cold weather, paying the express, 40 per pound. Hay, $16; corn, 62; rye, 95; wheat, $1.05; oats, 42. This is to each other, none being raised to ship out. Good cows from $60 to $100, and scarce; horses from $150 to $250. Dressed hogs generally brng 10 cents per pound; this year, 6½ to 8; hogs and poultry very cheap, the home butchers taking advantage of this strict quarantine which we are under at the present time.
Bridgman, Mich. N. S. W.

Potatoes were a good crop and sell at 50 cents per bushel in a small way; a large part not sold, no buyers in large lots. Apples were a big crop. Grafted apples sold at all prices from $1 per barrel to $2.50 in a small way; have just sold 20 barrels at $1.50 per barrel on car. Many in first hands and no sale. Cider apples sold for 20 cents per 100 pounds, and 18 cents per 100 pounds at mill or car. Thousands of bushels were left to rot, no sale, and could not pay $1.75 per day to pick them. Hay about $15 at barn and $20 baled. Beef, $9; dressed native not a large amount to be had. Cows, $40 to $75 as to size and quality. Pork, 11½c. dressed; fowls, 12; chicks, 13 to 14 alive. Cornmeal, $1.75 per cwt. Taxes, $2 on $100 of grand list. The high cost of living ought not to be considered high only on pork and beef. Butter, 35. J. H. A.
Cavendish, Vt.

Lowest Prices Ever Made on World's Best Roofing

Lightning-proof, Fire-proof, Rust-proof, Rot-proof, Galvanized Steel Roofing Lasts as Long as Building Stands

Once you have purchased and laid EdwardsTightcoteGalvanizedSteel Roofing your roofing expense for that building is at an end. Its cost per square is the lowest ever made. It has no upkeep cost. Always beautiful in appearance. Reducing cost of fire insurance.

Reo Cluster Steel Shingles

EDWARDS Exclusive Tightcote Process

Makes Rust-Proof Roofing. The zinc spelter becomes practically one piece with the steel. No ordinary galvanizing can compare with it. Each and every Edwards Metal Shingle, Metal Spanish Tile, each sheet of Edwards Reo Steel Shingle, Grip-Lock Roofing, Pressed Standing Seam or Roll Roofing, Ceiling, Siding, etc., is dipped in a bath of molten zinc, one at a time after the metal has been stamped and resquared. The edges are galvanized as heavily as the sides. Not the space of a pin-point on the steel is exposed to the weather.

Spanish Metal Tile

Edwards Pat. "Grip Lock"

How To Test Galvanizing

Take a piece of any other galvanized steel, bend it back and forth several times, hammering it down each time. You will then be able to flake off great scales of the galvanizing with your finger nail. Apply this test to a piece of Edwards Tightcote Galvanized Steel Roofing—you'll find no flaking.

Corrugated

EDWARDS Patent Interlocking Device

Prevents Warping, Buckling or Breaking. Protects Nail Holes. Roof never warps, buckles or breaks—nails are driven through the *under* layer not exposed to weather—cannot rust. No special tools or experience needed to lay EDWARDS Galvanized Steel Roofing; anyone can do the work—lay over old shingles if you wish.

Brick Siding

Reo Steel Shingles

Cost Less, Outwear 3 Ordinary Roofs and are your joy and pride forever. No matter what kind of a building you have in mind there is a style of EDWARDS *Tightcote Galvanized Roofing* exactly suited to your needs.

Ceiling

GARAGE $49.50

Lowest prices ever made on Ready-Made Fire-Proof Steel Garages. Set up any place. Postal brings illustrated 64-page catalog *free.*

FREIGHT PREPAID
Lowest Factory Prices

Greatest roofing proposition ever made. We sell direct to you and *save you all in-between dealers' profits.*

Hope Farm Notes

REPEATING STRAWBERRIES.—A new reader wants to know if it is true that we raised strawberries, grew potatoes and planted a new lot of berry plants on the same ground in one season. It is, and we see nothing remarkable about it. The strawberry field had been fruited five years. There was a fair crop, but so many weeds had worked in that it did not seem profitable to clean it. So, after picking, the field was plowed, turning the great mass of weeds and vines under. The potatoes were planted by hand—putting the seed pieces right down into the mass of green stuff beneath the surface. These potatoes gave us a fair crop. They were dug in early October. As soon as they were out the soil was dug up with the Cutaway harrow, tilted well, and strong layer plants were set out. They have rooted well and look now as if they would Winter and give us a small crop next year, and go on for three or four years more. There is nothing very remarkable about it. Some gardeners would have grown lettuce between the rows of potatoes and then would have had spinach now growing between the rows of strawberries.

HORSE OR MOTOR.—"I am about to purchase a small farm, and as I must commute to and from the city, I need a conveyance to get to and from railroad station. The question is whether to buy an auto or a horse and rig, the initial cost of auto not to exceed the prime cost of horse and rig. The main use of the farm is for poultry, so that the use of a horse on farm is limited. What is the proper thing to do in this case?"

New York. M. L.

I have never owned a car. Whenever the weather is fit I walk, as I need exercise more than being carried. I think it would depend on a number of things. Are your roads good? On bad roads the horse will get through better. On good roads the car will prove very satisfactory. Do you naturally love a horse? Some people do, and are most happy when driving or caring for him. If a man has real affection for a horse it would be well for him to own one. From your statement I should judge that the car would be more satisfactory. It is a form of slavery to take care of a horse. He must be fed and watered and cleaned and watched, doctored, harnessed and unharnessed, and this is a heavy tax upon a man who does not naturally care much for the beast. Of course, there are objections to the car, and it would be easy to name them, but on the whole I think it would suit your conditions best.

BELGIAN EMIGRANTS.—I have read a great deal about how the American people were going to manage the affairs of the poor Belgians, and about the only sensible one, and the best I have so far run across was the remarks of the Hope Farm man on page 1418; at least, it agrees with my ideas exactly. I would be glad to see a Belgian emigration to this section, but they are not coming. A people that will fight to a finish for their country are going back to it. I have seen it. The people here did not desert the South after the Civil War, when it was bankrupt and in a state of chaos; they went to work to rebuild it and lived on husks and sweat. What they did or did without is known only to themselves, as they did not look for sympathy or ask charity. The Belgians are going to do the same thing, and few will leave, and they will do it quicker, for they will not have to contend with reconstruction and freed slaves, so they will have their job much simplified. What is left of them will have only the devastation of war to contend with, uncomplicated with other problems. I do not look on the Belgians as objects of charity at all, but as entitled to the same assistance as the crew of a wrecked vessel; they need their wants for necessities supplied simply because they cannot supply them under existing conditions, and I think you have hit the nail right square on the head. Belgium is their home and they have fought for it and are going to rebuild it and occupy it again. MARSENA A. PARKER.

Alabama.

Needless to say that expresses my views on the subject. I have observed that some very good people seem to think charity gives them the right to boss those who are to be helped. That takes the heart out of charity. Those who are unfortunate need help, but it should not be rubbed into them. This idea of bringing the Belgian children here, whether their people want them to come or not, does not suit me. I know much about separating children from their people—from personal experience and otherwise. Let us help the Belgian people in their bitter trouble, but encourage them to go back to their own country and rebuild it. I know that what Mr. Parker says about the South is true. After it is all over I do not think any other class of people could have done better work.

ABOUT FEASTING.—Here is a friend who sends me what he calls "a bit of profound wisdom" as a New Year's suggestion:

"Fools make feasts and wise men eat them."—Franklin.

Not always. I have attended some feasts which were prepared by very wise men and women. They were eaten by more or less foolish people. The man of mature years does not show his wisdom by eating his way through a feast. He would be wise if he nibbled a little of it and let the rest go. My judgment would be that 80 per cent. of the people I know eat too much—more than they need and more than is good for them. Of course, I realize that it is not a very popular thing to tell a man he eats too much, and I do not expect many converts to this theory for 1915. If people would only suit their eating to their work or exercise they would be better off, but the habit once formed is hard to break off. For when you come right down to it, eating is a habit rather than the act of supplying a necessity.

MULCHING RASPBERRIES; COAL ASHES.—"I put some well-rotted manure around my red raspberry bushes. An old farmer told me that it would kill them. Part of my garden gets very hard in dry weather. I was going to put sifted hard coal ashes on, and he told me I would make it harder by doing so. Is this true?

New York. E. M. L.

I do not like to put such manure up close around bushes or trees. In warm spells of Winter or Fall I have had some trouble with injuring the bark, and mice also work under it. I would put such manure out several inches away from the bush or tree. Coal ashes are good to pile close around the bush or tree trunk. Sifted coal ashes have helped some of our hard soils by opening or mellowing them. They are not as good as lime or wood ashes for this work, but they help us by opening the soil.

PEACH VARIETIES.—A farmer who lives some six miles from us asked for a selection of peach varieties. After looking up the catalogues he names the following—to be cut down to eight varieties: Mayflower, Red Bird, Arp Beauty, Alton, Hiley, Belle of Georgia, Elrose, Champion, J. H. Hale, Illinois, Niagara, Krummel's October. Then he says:

"You will notice that I did not include any such well-known varieties as Carman, Crawford, Elberta, etc., standards in the neighborhood, because the catalogues describe the varieties chosen in their place, as far superior in quality, size and hardiness. What is your opinion about it?"

I stick to old friends. I have found nothing better than Carman for its season. Mountain Rose does well with us, also Crawford and Salway. Niagara is good, though not a heavy bearer, and Belle of Georgia is excellent, though you do not want too many white peaches. My personal opinion is that J. H. Hale is to replace Elberta. As for buying varieties on the strength of what the catalogues tell you—I thank you, no. It is well to experiment with a few of the new ones, but take my advice and stick to the old reliable varieties which business-like growers plant in your locality. If you were buying clothing, or hardware or anything else which you use in your regular trade, would you take just what the sellers told you without question?

H. W. C.

A PROBLEM IN SWAMP DRAINAGE.

CAN you tell me at what depth tiles should be laid to drain muck land? I have in taking up tile at a little over three feet found living grass roots in them, but this might have been caused by channels made by surface water entering the points from the top soils. In one instance I have found tiles nearly choked by grass roots at a depth of 18 inches. This was a six-inch tile with constantly flowing water. Can you tell me of a plan for draining muck land where the bottom of the trenches to receive the tile is so soft by the time the earth is removed that the soil is puddled, making the tile uneven when laid? Such soils usually have so little incline that tile is of questionable utility when complete. I have thought of a plan of laying tiles in open trenches uncovered for a year, or until a time when the permanent trenches could be prepared alongside with a reasonable certainty of securing a bottom sufficiently hard to get a perfectly smooth surface, solid enough to hold the tiles from tilting up and down. Again, the contour of my land is such that in places the main line of six or eight-inch tile would have to be shallow. I have thought of the plan of placing stones over and around the tile to prevent grass roots from getting a start, but am not sure of the success of the plan, or the tile could be covered with a raised ridge, but as water, sufficient to run a sawmill, courses through during the time of melting snow this plan might not work, as the surplus water might wear away the soil. Is there danger of getting the joints so close, especially in puddled soils, as to prevent the water from entering the joints? I fear this is the case with some of mine, as water stands in holes I have dug as close as three feet to the tiles, and within eight inches of the top. How can I remedy this without relaying the tiles? Is there any advantage in using vitrified sewer pipe over one foot lengths of land tile? I have used sewer pipe in puddled muck land to some extent, so as to insure continuous joints. In exposed situations with little covering is land tile hard enough to prevent breaking and crumbling by frost? I. L. W.

Gardiner, Me.

In all such cases boards should be used in the bottom to lay the tiles on. The longer these boards are the better, as there are less joints. The drain tile length of 12 inches is preferable to any other. A joint between two tiles should never come at a point where the ends of the boards meet. For six and eight-inch tiles a six-inch width of board should be used. An eight-inch would be better. Narrower strips of boards will answer for the smaller sizes of tiles in the laterals. Boards in that character of soil will last almost indefinitely. Never put stones, clay, sand or muck over the top of the tiles, but rather use cinders, damp coal ashes or loam (gravelly loam preferred) to a depth of six or eight inches. A uniform grade should be established where the percentage of grade is low. Three inches fall to the hundred feet will answer, but more is better. As to root growths entering and obstructing the tiles, this sometimes occurs where there is constantly running water in the line, but seldom where the work is properly done and the land is under cultivation. In draining such lands there must necessarily be places where the depth of the drain will be more than in others; 18 inches in a low spot ought to work all right, but in such places after filling in around and over the tiles a board should be placed on the top of the tile to prevent the displacement when the ground is soft. Now as to the erosion caused by the current of the Spring run-off. If this occurs near the outlet, as it often does, a dam or ridge of rocks and stones placed at such a point will allow the water to flow through and over, but will hold back the soil that washes down with the current, until it will fill in and level up that shallow area, thereby giving the drain the proper depth. If this occur along the line farther back in the field a temporary obstruction can be placed at the lower side of the shallow place. This can be made with fine brush, cornstalks or even straw, with a few rocks or large stones to hold it in place, and perhaps some stakes. If the current can be turned aside and around such a spot it is better than to have it following the line of the drain. There is no danger of tile crumbling by frost action where the hard-burned Ohio shale tiles are used. They are hectagonal as to outer surface, and are non-porous. If you cannot get this tile, a hard-burned thin-walled clay tile will answer, but it must be free from lime and impurities, which cause the crumbling where freezing and thawing occurs. Laying the tiles in open temporary trenches would, I believe, be a waste of time. In laying tiles in any soil, I always place the joints as close together as possible. You cannot keep the water out of a tile drain. There are little leaks in the roof every 12 inches, and the water is bound to enter unless clay has been placed over the joints to seal them up. There is some spice in overcoming difficulties, and these are often encountered in drainage work. HENRY E. COX.

ROSETTE IN PECAN TREES.

THE newspapers have stated in the last few years that Edison has said no one knows one billionth part of one per cent. about anything. The bulletin lately published on pecan rosette by the National Government proves it. After years of careful study and many elaborate tests the authors of this bulletin honestly admit that they do not know what causes it, nor what will cure or prevent it. I have had for my constant companions for the last 36 years pecan trees, and while I am no bacteriologist nor entomologist, I have a little common sense, and can shed a little light on this subject.

Six years ago I made the statement before the National Nut Growers' convention that rosette was caused by some bacterial growth upon the roots of the tree. Prof. Gossard said that I was wrong. Upon my return home I at once began to study rosette, and after six years' study I have proved beyond a shadow of a doubt that I was wrong and that Prof. Gossard was right. The most complete refutation of any theory is this. A physician lecturing before a popular audience said that every case of grippe originated from wet feet. A man in the audience interrupted him and said: "You are wrong, sir, for I have two wooden legs, and I have just got well from a very bad case of the grippe." Now I have just as positive proof that rosette is not caused by any growth upon the roots of the tree. It is this. The common wild pecan of Louisiana never suffers from rosette. Yet when the Sehley pecan is budded or grafted upon the wild roots they frequently die of rosette.

There is one bold mis-statement of fact in the Government's bulletin which I wish to correct; that swamp land is entirely exempt from rosette. My groves, which are situated upon swamp lands, have developed several cases of rosette. I have never known a case among my nursery trees.

Now I wish to tell of a few things that I have found out about rosette. The disease is inherent in certain varieties of pecans, and is very similar to locomotor ataxia in the human species. It is not a germ disease at all. It is the lack of sufficient nutrition. Certain varieties have not strong enough digestive organs to assimilate the food under ordinary conditions. Here with me certain varieties are very subject to rosette, and other varieties never have it at all. The Schley trees nearly all die of it, except under very high cultivation. Moneymaker never shows any sign of it. Russell often devolops it, while Carman never does. The common wild pecan of Louisiana never shows a trace of it. Now notice this fact strongly. While the Schley nearly always dies when not properly cultivated, still when very highly cultivated it shows no sign of rosette, and I feel sure that when the scientists get at the bottom of the matter they will see as plainly as I do that rosette is a failure of the pecan to digest its food properly. Certain varieties are naturally dyspeptics. SAM H. JAMES.

Aphis and House Plants.

THIS is the season when the aphis is making its appearance on house plants and in flower and vegetable forcing establishments. There are many varieties of this very troublesome pest. In all cases no matter what variety, or on what plant it is found, the aphis can be overcome by tobacco, whether in the form of dust, smoke, or a decoction made by steeping the refuse tobacco stems from the cigar makers, using one pound of stems to five gallons of water. Just now, the pest has made its appearance the first time this season on the lettuce in the greenhouse. Our method of combat is to apply tobacco smoke about twice a week. We set a number of little earthen pots throughout the greenhouse, fill these with tobacco stems made damp with a little water. We then close up the house tight and light the damp tobacco stems. For the best results the smoke should become so dense that the plants cannot be seen through the glass. It is sometimes almost impossible to dislodge the aphis when it has once completely covered the plants, and for this reason it is necessary to begin with the smoke before the pest has made its appearance. Plants growing in the open that are affected by the aphis are best treated by tobacco dust applied freely after dew or rain. However, in extreme cases, when the pest attacks also the under side of the leaves, it is necessary to apply tobacco in fluid form with a syringe. A. B.

NOTES FROM A MARYLAND GARDEN.

WEATHER AND CROPS.—Down here in southeastern Maryland November gave us but three cloudy days, almost unbroken sunshine and little rain. December is making up for this, for we have just passed through a long northeaster storm with plenty of rain and a minimum temperature of 38. I have three lines of cold frames planted in lettuce for Christmas heading. Two of these have the double-glazed sashes and one the single-glazed. Owing to the continued mild temperature the single-glazed sashes have kept up very well with the double-glazed ones, but with the coming of cold weather the single glass will have to have a night cover, while the others will do without any, and thus save a great deal of labor. In this flat country, between bay and ocean, we have a great sweep of the high winds, and one advantage of the heavy double-glazed sashes is that they never blow off as the lighter sashes will sometimes, if not wedged down. Just now the spinach cutting is going on merrily, and I never had a finer growth, while the late-sown spinach that is intended for Spring cutting will soon be large enough to cut unless the weather turns colder and compels it to go dormant.

FERTILIZERS.—Our Irish potato growers are worried over the prospect of getting no potash, for it is very generally assumed that it is needed in our sandy soil especially for the crops of both Irish and sweet potatoes. Our growers very generally have been using a fertilizer containing 7 per cent. ammonia, 8 per cent. phosphoric acid and 5 per cent. potash. My own opinion is that they have been wasting money in buying so high a percentage of nitrogen for the potato crop and paying $38 a ton for it. This 7 per cent. article gets its nitrogen from fish scrap and nitrate of soda and the presence of the nitrate causes it to cake badly and makes it harder to apply with a mechanical spreader. It makes an admirable fertilizer for leaf crops like spinach, cabbages, etc., but for the root crops a much smaller amount of nitrogen would be needed. With the long-continued and heavy application of fertilizers containing a considerable percentage of potash I am of the opinion that the soil has accumulated a very considerable residue of potash, for the soil will hold on to any unused potash and phosphoric acid while losing nitrates rapidly. I believe therefore that by making a home mixture of cotton-seed meal and acid phosphate the potato growers can do without the potash, since the cotton-seed meal will furnish some potash, while the fish scrap and nitrate of soda do not. A ton of fertilizer made of equal parts of cotton-seed meal and acid phosphate I believe will give better results on the Irish potato crop than the popular seven per cent. goods.

STABLE MANURE.—One potato grower in Accomac County, Va., writes that he is thinking of using the New York stable manure, which will cost him $3.30 per ton delivered at his station three miles away. Now I cannot see that he can make it pay to use fresh manure at this price for the Irish potato crop and have so advised him. Our cantaloupe growers still use the New York manure at the advanced price, and are already putting it in the furrows to lie and rot till planting time. Even for these I believe that a better plan would be to compost the manure now with woods mold and prepare a compost that will be in better shape for using in the Spring than the raw manure will be lying in the furrows. In fact I very much doubt that for any of our truck crops it pays to freight and haul the New York manure on the present high price. I believe that with a good growth of Crimson clover on the land to turn under for the cantaloupes and other crops they would have better and more economical results with good commercial fertilizers. It is true that for some crops the clover would have to be plowed down when not more than half grown, but it has been proven that Crimson clover does the greater part of its nitrogen-fixing in the Fall, and it will pay to grow it as a Winter cover and humus-maker even where it has to be turned early. And for the sweet potato crop it would very profitably take the place of the rakings of the pine forests which are universally hauled out by the Eastern Shore Virginia growers during the Winter to plow under for their sweet potato crop. They would have better organic matter and an abundance of nitrogen for the crop while saving the loss of nitrates in their open soil in the Winter rains.

FALL GROWTH.—Owing to the mild Autumn weather my onion sets, planted in September, have grown almost large enough to use already for green onions, and I hope thta they will winter well. Leeks are in their glory, and they make an excellent substitute for green onions in Winter, for here, where we have about as much open soil in Winter as hard frozen, it is seldom difficult to get the leeks for use or the parsnips, salsify or carrots, all of which we leave where they grew. My Fall-planted sweet peas are now a foot high on the wire trellis, and seem to be perfectly happy. I would have preferred to have had them make less growth, but hope they may come through. The Fall-sown sweet peas usually give us the best bloom, as they come in before the hot weather. In January I expect to plant more. I dig a trench fully 15 inches deep and fill it half full of rotted manure, cover this with soil and plant and cover fully six inches deep, and from this sowing generally get a good bloom. W. F. MASSEY.

Maryland.

SPRING WHEAT.—We have a number of readers who insist that they want to sow Spring wheat in New York State. Our conviction is that Spring wheat is not over 60 per cent. as useful or efficient as Winter wheat. Yet we find people who refuse to accept such opinion. One of the best authorities we know of says this:

"I agree with you that there is no place in New York State where farmers can sow Spring wheat as well as they can Winter wheat. We have tried out Spring wheat very thoroughly in Western New York and not one year out of five is it a success. Under the most favorable conditions, Spring wheat will not give over 10-15 bushels per acre when Winter wheat will produce 25-30. You are correct in your instructions that if these people insist upon sowing Spring wheat, the same preparation and method of sowing as oats is the proper one, they cannot get the wheat in too early in the Spring nor they cannot put it in too well or fertilize it too heavily. There are half a dozen kinds of Spring wheat that are grown in New York State but probably the Early Fyfe is as good as any, but none of them will do as well as Winter wheat sown on the same soil and properly put in."

"HAVE you found a customer for your gramophone yet?" "Oh, yes—I played it for 12 hours on end, and all the neighbors clubbed together and bought it from me."—London Opinion.

"For the Land's Sake, use Bowker's Fertilizers; they enrich the earth and those who till it."—*Adv.*

THE BUSINESS FARMER'S PAPER

A National Weekly Journal for Country and Suburban Homes

Established 1850

Published weekly by the Rural Publishing Company, 333 West 30th Street, New York
HERBERT W. COLLINGWOOD, President and Editor.
JOHN J. DILLON, Treasurer and General Manager.
WM. F. DILLON, Secretary. MRS. E. T. ROYLE, Associate Editor.

SUBSCRIPTION: ONE DOLLAR A YEAR

To foreign countries in the Universal Postal Union, $2.04, equal to 8s. 6d., or 8½ marks, or 10½ francs. Remit in money order, express order, personal check or bank draft.

Entered at New York Post Office as Second Class Matter.

Advertising rates, 75 cents per agate line—7 words. References required for advertisers unknown to us; and cash must accompany transient orders.

"A SQUARE DEAL"

We believe that every advertisement in this paper is backed by a responsible person. We use every possible precaution and admit the advertising of reliable houses only. But to make doubly sure, we will make good any loss to paid subscribers sustained by trusting any deliberate swindler, irresponsible advertisers or misleading advertisements in our columns, and any such swindler will be publicly exposed. We are also often called upon to adjust differences or mistakes between our subscribers and honest, responsible houses, whether advertisers or not. We willingly use our good offices to this end, but such cases should not be confused with dishonest transactions. We protect subscribers against rogues, but we will not be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent to us within one month of the time of the transaction, and to identify it, you should mention THE RURAL NEW-YORKER when writing the advertiser.

CAN any reader give us the facts showing clear and undoubted damage to crops by wild game? We want particularly facts about such damage in New York—they must be clear-cut and exact evidence showing actual loss.

*

THIS question of "misfit" trees is a mighty one for fruit growers. On page 1499 you will find a lawyer's statement of such a case recently tried in Western New York. There has got to be some definite rule for legal action in cases of this sort. We think farmers are now more determined than ever before to carry them through. We have asked the nursery company in this case if they care to make any statement.

*

HERE is one thing about this "farm manager" business. There are a good many farms which do not do enough business to support a "manager." The owner may think so, but when he pays a man simply to "manage" the overhead charges become so heavy that they cave the entire roof in. Such farms need a working foreman—that is, a man with shrewd common sense who can and will do actual farm work with the other men. Do not hunt for a "manager" until you get more than a working foreman can attend to.

*

SOUTH CAROLINA has a remarkable law designed to control the acreage of cotton. It was passed in October. The first section of this law is as follows:

Be it enacted, etc., that it shall be unlawful for any person by himself, his agents or employes, to plant or cultivate in this State in any year, a greater number of acres of land in cotton than one-third of the total acreage of land planted and cultivated in all crops by such person in said year, including grain and Fall-sown crops planted the preceding Fall or Winter.

There is a penalty of $25 to $100 for each and every acre planted in excess of the number mentioned—such penalty to be a lien upon the cotton crop. The object of this remarkable legislation is to cut down the output of cotton and thus help to regulate prices. Of course no one can now tell what its effect will be, or whether the courts would uphold it. We may ask ourselves what we should think if the New York Legislature undertook to penalize us for planting as many peach trees as we saw fit. It merely shows the desperate condition of Southern cotton farming. A canvass of our South Carolina readers indicates strong opposition to the law and the hope that the next Legislature will repeal it.

*

YOU may be interested to know that two years ago I owned two cows and made butter, in fact owned those two only one year, and kept them around on a fruit farm when some of my friends wanted bottled milk. I tried out your theories of soiling and feeding cows, and have increased my herd to 12 cows, three yearling heifers and a registered Guernsey bull advertised in THE R. N.-Y. Now these cows have in the two years fed themselves, bought and paid for the herd, put up a 10x30 silo, paid for a cutter and blower, and many other improvements. Before April, 1912, I never owned a cow, never raised anything but a garden and fruit, and on this farm had no standing grass. My farm contains about 60 acres, the greater and better part of which is filled with fruit. M. C.
Hudson Valley, N. Y.

We print that as indicating what we feel sure is coming in the dairy business. There is to be a readjustment, and it will go on rapidly. Hundreds of farms which have for years been used for milk production are going out of business. Changed market conditions have made it impossible for their owners to keep up with the requirements of milk inspection and pay the increased prices for feed. As these farms pass out of the business, smaller herds of cattle are appearing on fruit and truck farms to supply needed milk. These small herds are usually very choice, containing purebred animals of good breeding. Every fruit grower knows that he must have high class varieties, well adapted to his soil and conditions. He cannot afford to keep scrub trees in bearing, and so he knows that scrub cattle will not pay. On every fruit and truck farm there are many wastes in fruit, cornstalks, cover crops, etc., which may be fed to cows as roughage in milk production. If the herd is kept down to about the limit of this cheap fodder, and only good cows are kept, the milk is produced at a low cost. This dairy addition gives profitable Winter work and much-needed manure. In these times it would hardly be possible for a small herd to earn all that is mentioned above, except where extra good animals are kept, so that the business is a side line for fruit growers or gardeners. There will be much more of this done in the future. It is the coming great change in dairying.

*

NEW YEAR'S GREETING! The year has swung around once more, and the time has come for our little annual talk to readers. It has been a busy year, and it seems to have gone more rapidly than any that have passed before. Busy hours are best. THE R. N.-Y. has gained in size at least. During 1913 we printed 1396 pages with 559 pictures. With the close of this year we show 1512 pages and 661 pictures. We have answered over 20,000 questions by mail in addition to those put into print. As to the quality of this work we must leave that to the judgment of 160,000 and more keen and kindly critical families who follow us each week. One thing we are sure of. Never before during all these long years has the feeling of friendship between the paper and its readers been truer or more beautiful or more enduring than right now as we pass on into another hopeful year. While such friendship and kindly feeling exists we have no misgivings regarding the future, but go hopefully on, sure that our people will go with us. Needless to say that we wish you all the happiest and best that your life can produce in 1915.

It is to be a notable year, and we think one with great opportunities for the American farmer. The world is looking to this country for the necessities of life—bread and meat and clothing. Out of this world necessity will come our great material opportunity. Our farmers will learn how to organize and conduct their business so as to obtain a fairer share of what belongs to them. And the world's necessities are not confined to material things. The awful European War is destroying property and human life, and filling the world with sadness, but it is also doing the impossible—changing human nature. Out of the horror of it all, out of the great national sacrifice, there is growing a more thoughtful and serious France, a more liberal and freer Germany, and a truer and better England. And so this nation, and our farmers in particular, must meet these world's great necessities—not only for the material things of life, but for those greater things "not made with hands." They are charity, brotherhood, fair dealing, self-restraint, and eternal, enduring faith in the power and integrity of the common people.

*

HERE is a problem for you to solve and publish, if you think it will interest any of your readers. The street on which my property is located runs parallel with the Hudson. My neighbor on the opposite side of the street wishes to sell and the purchasers desire me to lease to them the view from their piazza. Should I plant a row of trees along my fence it would obscure the view. The distance is 150 feet, involving about three acres. Land now used for pasture and valued at $500 per acre. What price per year would you charge? I should never interfere with this view unless to build a house, but they do not trust me. H. H. S.
New York.

This is one of the most remarkable propositions we ever had put to us. The general use of flying machines has brought up points of law regarding the use of the air, but the actual value of looking out over a field is surely a new one. We print it to show what a wide range of human life our readers cover and also to see if any such problem has come up before. What would you charge for guaranteeing the right to look across your pasture? Thousands of our readers can look far off across the hills and valleys with no neighbor in sight. It will seem strange to them that people are willing to pay for a lease on scenery!

*

"FARMING is unusually profitable at present as everybody is paying sky-high prices for farm produce."

We find that bit of childish reasoning in the Jersey City Journal—a paper usually very sensible and sound. It is childish reasoning, because any adult ought to know that the price charged for a peck of potatoes by a grocer is no evidence that the farmer who grew those potatoes is prosperous. Today, while city people are paying at least $1.25 a bushel for potatoes, farmers in the interior are selling or trying to sell at 30 cents! These sky-high prices dissolve into thin air before they get to the farmer. For years we have stated that on the average the farmers of this country receive 35 cents of the consumer's dollar and no one has disproved the statement. Usually when retail prices are boomed "sky-high" the farmer receives less than 35 cents. It is surprising that really intelligent papers should continue to argue that high retail prices for food must mean prosperity for farmers. If kerosene went up 10 cents a gallon they could rightly connect it with Standard Oil prosperity. If the street cars doubled their rates we would know the stockholders were more prosperous. In these cases the connection between "sky-high prices" and prosperity is clear and exact, because there are no middlemen to stand between. In the case of high retail prices and farmers there is no such connection because both the consumer and the farmer must feed a lot of parasites in addition to the necessary middleman. Why cannot papers like the Journal see this, and help their readers by pointing out the fact?

*

AT this season of the year we have all sorts of communications from readers. It is a sort of general winding up of the mainspring that keeps the works going. Here is a rather unusual proposition which will interest some of our people:

Please send me a good fish market if you want me to keep on taking this paper. If you can send me a fish market that I can make something in I will send on the money for paper as soon as I can get fresh fish in the Winter. If you cannot send a good place I shall not take this paper any longer. O. T.

Finding fish markets when they are needed is part of our business, and this was sent to one of our big army of helpers. He found the market and told O. T. about it. In his report to us he writes:

I am reminded of the verse that reads, "*He that is greatest among you is servant of all.*" THE RURAL NEW-YORKER is truly a great paper, and it is the spirit of service that has made it great. This man is paying tribute to that greatness, even though he does couple a threat along with his request.

That is a very happy and good-natured turn of this request. We do not regard this as a "threat" at all. It was only a way of showing that this fish market was the most important need—here at the end of the season. We try to meet all our friends with good-natured and helpful service. At this New Year's let us remind you once more that THE R. N.-Y. *has at its command the largest and most complete corps of farm helpers and advisers ever gathered by any paper since the world began!*

BREVITIES.

PUT no claws on Santa Claus.

CHARCOAL for the pigs—all the "stock foods" contain it.

"SOFT soap" is the wax most politicians use in "grafting."

THOSE who live in a progressive age need a strong brake when riding in the stage.

WE should think rye would be a good crop at the South to lead to other kinds of grain.

"BACK to the woods!" is good advice for many a farm or township. Plant trees. Many a hillside should never have been cleared.

THE European War is likely to affect prices for the cranberry crop. Many growers believe the European supply will be badly cut off.

LET us again call attention to the incongruity of giving "loving cups" as prizes for farmers at farm shows. Why not give them the cash?

THE U. S. Geological Survey states that "wild cat" oil promoters are working in Northwest Missouri. There is little hope for profitable oil and gas there.

THE Massachusetts Forestry Association offers as a prize the planting of 50 acres of White pine, to the town which gains first place in a contest for town forests.

THE New Jersey Experiment Statio. finds dynamite very useful in blowing out old orchard trees. Pear trees owing to their peculiar root system are hardest to dislodge.

PROF. KIRKPATRICK of the Connecticut College figures that at this year's egg contest it will be necessary to operate the trap-nest some 200,000 times in order to care for every hen.

A FEW years ago our scientists were scouring Asia and Siberia for hardy varieties of Alfalfa seed. Now a sample of hardy Alfalfa seed has been sent to Turkey for trial.

OUR advice is not to make any New Year's resolutions based on the belief that bad habits can be shed like a hen's feathers. Begin to *dig* them out and keep at the job humbly and silently.

CONCORD, MASS., is celebrated for asparagus culture. One of the cornerstones of successful culture is sowing a cover crop like Crimson clover or vetch in late Summer right in the crop. This, plowed under in Spring, keeps up the humus supply and adds nitrogen.

IF every little brook were to dry up and refuse to run down hill because it is so small, what would become of the big river? If you and your neighbor quit trying to improve conditions because you do not hold high office—what becomes of the country?

LAST year heavy shipments of eggs and poultry were made from China to the Pacific Coast. These became so heavy that American poultry men became dubious. This year these shipments will fall off. They were not all profitable and freight service cannot be had.

N. Y. STATE AGRICULTURAL SOCIETY.

THIS year the New York State Agricultural Society promises to outstrip in attendance all previous annual conventions. It will be the seventy-fifth annual meeting of the society. The program is varied and interesting. It contains names of speakers not before heard in the farm conventions of the State, and the subjects to be discussed are of timely interest and pressing importance.

Two new features are introduced this year. One of them may be said to be actually introduced last year when Mrs. Julian Heath was elected First Vice-President. Women's attendance was then assured as a feature of the meeting for the future. The Housewives' League members will be out in force. Mrs. Heath is President of the National League, and she is preparing for the entertainment of the members at Albany.

The other feature is the banquet on Tuesday evening. This will be a popular dollar-a-plate feast. Farmers and their wives should make it a point to attend this convention. Accommodations may be secured through the committee at hotels or private houses. The Society is doing an aggressive work in the interest of the farm, and every producer in the State should become a member and help direct its influence and energies to the betterment of the agricultural needs of the State.

LONG DISTANCE PANCAKES-

EARLY in October a friend in Columbus, Ga., asked for the address of a miller in New York State from whom he could purchase buckwheat flour, and the price of this flour. Buckwheat flour in his local market cost 6½ cents per pound in small lots, and six cents by the hundredweight. The name of a miller in Tioga Co. was given him and he ordered 200 pounds, paying $3 per hundred for it. Being interested in the outcome of this long distance direct purchase, we asked this friend to tell us the details of the experience. The flour was shipped October 16, and reached him on the 27th, this being considered a short time in transit. The flour was packed in paper bags enclosed in cotton grain sacks, and sent by water from New York City. It arrived in first-class condition, though the paper bags inside the cotton ones were torn. The freight was 61 cents per hundred. He says that they are eating buckwheat cakes twice a day, and that the more they eat the more they want, so the quality was evidently satisfactory. To Northern farmers who are accustomed to thinking of buckwheat flour as strictly a cold weather diet it sounds somewhat strange to read of digging sweet potatoes in Georgia with buckwheat pancakes as the motive power, but the taste, once acquired, is probably never lost. This incident shows what a vast distribution of local products could be made throughout the country if country people could only learn how to get together. We once bought maple syrup in Vermont and buckwheat in New York, and sent them to a reader on the island of Java.

CONDITIONS IN THE COTTON STATES.

THERE can be no doubt that the Gulf or cotton-growing States, are having financial trouble. The great war has interfered with the cotton trade, and cotton is the foundation and the mainspring of Southern business. Money, business, society, all grow on the cotton plant. Yet the present trouble will eventually help the South. Take this note from Alabama:

> One good thing about our hard times, which will be the making over of our farming, is that a farmer can now get money advanced to raise hogs or cattle, wheat, corn, or any crop, which is a new thing. I was talking to a cotton factor a day or so ago, asking if he would advance money on wheat, rice, etc., and he said he would be glad to, or on cattle, and would rather do so to any of his reputable customers than to give them coin on cotton. M. A. P.

For many years the statesmen and wise thinkers of the South have seen the evil results of the farm slavery to cotton, but habit and old prejudice have been too much for them. Now if the money-lenders take a hand and will loan on corn, wheat, cattle or dairying, we shall soon witness changes which half a century of old custom could not change. The seed stores and implement dealers throughout the South report a great demand for grain and grass seeds, and improved tillage tools.

Boston Retail Farmers and Consumers Market.

FOR several years past an agitation has been going on, with much talk but little action, in regard to establishing branch markets or market stands in different sections of the city, so that the people could go to these places and buy green produce, and also milk, butter, dressed poultry and whatever the farmers might bring on. Former Mayor Fitzgerald tried to establish milk depots a few years ago but it was decided this was not practical after studying the subject in all its phases. It remained for the present city head, Mayor James Curley, to push this market question to a head and establish a trial market late this season in the thickly settled south end district where it is handy to get to by thousands of the poorer classes to whom the chance to buy farm produce direct from the grower in retail quantities at wholesale prices is a great boon. It was decided to allow no middleman to get a hold here and control prices in any way. This is a market strictly for the people to buy direct from the farmer wagon in any quantity desired, but all sales must be by weight or numeral count.

Great credit is given and no doubt deserved by the Mayor for the success of this project in the short time it has been running, from September to present time. No charge is made for stands or rather for space for farmer wagons to stand on. The present location will hold about 30 of these comfortably, but 47 were crowded in on the big day of the season one Saturday when many thousand people took advantage of the chance and improved it by buying heavily on this date and also at several others as well. A quantity equal to 3,000 bushels has been disposed of in the best days this season. Saturdays are the best days, weather permitting, for both sellers and buyers. This market is not opened on stormy or bad days, as this market is conducted on vacant land leased to the city and no shelter is provided. This is one bad feature, as buyer and sellers may not always be sure whether there will be any market or not on the days they may plan to go there, and this will have to be worked out later by establishing signal stations in different sections of the city and near-by country, which could be reached by phone and word sent to each as to whether the market would be open this day or not. This plan or something like it might solve to a large extent this trouble, and next year will no doubt bring some system with it which will improve or solve some of the present difficulties. The greatest difficulty at the start was to get the farmers to take heir goods to this market, as many people held the opinion that the consumers would not turn out in sufficient numbers to make it successful. The people came, however, on the first opening day, and as only one or two farmers had had the courage to appear with goods to sell, the enemies of this market project set up the cry "The new market is a failure," but this class cried out too quickly. The farmers woke up and brought in sufficient stuff to supply the buyers, and the buyers kept coming and bought the stuff. Success was assured, and Supt. of Markets Graham and Deputy-Supt. Quinn, on whom the work of bringing abont the result had fallen, felt well pleased and repaid for their hard work in personally canvassing and inducing the farmers to go there and make the trial.

In regard to prices received by the farmers, these have not been large perhaps, but neither has the produce been as the rule of the fancy class, as the trade did not require this, and as a rule could not afford to pay for this class of stuff, but they did buy and pay fair prices for quality of goods. Most of the sellers are satisfied they have done fairly well, and the buying public are sure they have, and this feeling of "I am satisfied" on both sides means a successful continuance of this market next season and probably in future seasons. The city officials are so pleased they intend to enlarge this project and establish in other sections where population requires or would support them other branch markets of a like nature.

Some classes of people in Boston are not pleased at the success of this season's trial, and have planned on several occasions to break up the market with hoodlum gangs, but warnings have been received in time to have police enough on hand to prevent this, and while it is thought this will not be tried again, yet watch will be kept, and any attempt will likely cause trouble for those who try it.

All kinds of vegetables, cheap or common grades of apples, dressed poultry and eggs, have been disposed of there on most days to good advantage. Apples sold at 10 to 20 cents per peck, largely at 10 to 15; this seems perhaps, to many, a very small price, but these were windfall fruit of just fair quality and considering that about 30 cents per bushel was all these would bring at the regular market when they could be sold at all and farmers had to give away or carry home part of their load several times, this price is not so bad after all. We sold onions at the new market at $1-$1.25 per bushel by selling in small lots of a few pounds each; these would only bring 50 to 75 cents in regular market. We sold carrots on about the same proportion. We sold poultry, largely dressed chickens, at about the retail price of these in the different retail markets. The little extra trouble we had in handling or selling in small lots instead of bushels was more than balanced by the extra receipts or prices we received, or about 100 cents on the dollar against the much-quoted 35, which is all many producers receive. A. E. P.

New York State News.

AUTO FINES BELONG TO STATE.—The Attorney-General is investigating the practice common with some justices of the peace, of turning over to the village, town or city treasury the moneys representing fines for speeding and other violations of the highway law. The law is explicit on this point and there would seem to be no good reason for diverting the moneys received for fines from the State treasury. If it is found that violators of the law persist in continuance of the practice, proceedings will be instituted to compel compliance with the law.

POMONA GRANGE MEETINGS.—The annual meetings of the county or Pomona Granges are being held this month. The order seems to be in a most flourishing condition in all sections of the State according to reports from these Granges. The banner Grange county of the State is now Chautauqua with 8030 members, closely followed by Jefferson wtih 8007. Last year Jefferson was in the lead. It takes a half dozen Western States to equal in Grange membership either one of these counties. Fredonia Grange No. 1, alone, has 661 members. These county Granges are cooperating everywhere with the Farm Bureaus in more businesslike methods in farming and making the soil yield better returns.

FORESTRY LECTURES.—The Granges and high schools in and near Ellicottville and also at Gowanda are coöperating in arranging for a series of lectures on forestry which are to be given by representatives of the college of foresrty at Syracuse. In addition to State work local questions, wood lot management, fire protection, etc., will be discussed by the speakers. Prof. W. A. McDonald will be the speaker at most of the meetings.

APPLE HOLDINGS HEAVY.—Large growers and small seem to have faith in future, as regards the apple market. At any rate there is a big stock of apples in storage not only in this State but in all sections where apples are grown to any great extent. It is said that the holdings in this State are equivalent to over 2,500,000 barrels which is nearly 900,000 barrels more than last year at the same time. In New England the quantity does not vary much from last season's holdings. In a general way it may be said that there are 3,000,000 barrels more in storage all over the country now than a year ago.

ONTARIO FRUIT GROWERS.—The ninth annual meeting of the Ontario County Fruit Growers' Association was held at Canandaigua on the 11th inst. Papers were read by Prof. P. J. Parrott of the Geneva Experiment Station, A. C. King of Trumansburg, Paul Work of the College of Agriculture and Samuel Fraser of Geneseo. W. P. Buell of Holcomb was elected president, C. C. McKay of Geneva vice-president, Walter Robson of Hall secretary and W. C. Norton of Victor treasurer.

FISH AND GAME OFFICIALS.—At the final session of the State Fish, Game and Forest League convention at Utica, Geo. A. Lawyer of Watertown was re-elected president, Louis C. Andrews of Elmira secretary and Emerson Stowell of Oswego treasurer. Auburn gets the 1915 convention.

ONONDAGA GRANGERS.—A feature of the recent annual meeting of the Onondaga County Grange were the reports from 84 crop observers in the county. This county has a crop report system of its own which is very helpful to the farmers. A movement was instituted at this meeting to bring both the State and the National Grange meetings to Syracuse in 1916. The National Grange meeting for that year will be the occasion of the observance of the semi-centennial of the organization of the order, and being centrally located as to the East a host of members of the order would attend the ceremonies. Another plan will be submitted to the next annual session of the National Grange for the semi-centennial celebration.

LARGE SHIPMENTS FROM SODUS.—When Sodus, Wayne County, growers shipped more than 300 cars of fruit and other farm produce during November it broke all records for a single month. There were 182 carloads of apples; 56 cars evaporated; 12 cars lettuce; six cars grapes; 19 cars onions; 17 cars canned fruits; 12 cars celery and so on. There were still 500 cars in storage on Dec. 1 divided as follows: 130 cars celery; 300 cars apples; 40 cars onions and 30 cars canned fruit. The price of onions is still creeping upward and one authority says the holders are expecting a dollar, net. Some of the local buyers took hold of the market early at 25 cents per bushel and are reaping a harvest. One firm is reported to have made $10,000 on their purchases from one grower. Growers of the better apples are holding for better prices and practically all the inferior fruit is off the growers' hands. J. W. D.

State Dairymen At Rochester.

THE elimination of exhibition features from New York State Dairymen's Convention, and absence of live stock as result of foot-and-mouth disease situation limited the appeal of the meeting of New York dairymen and breeders held at Rochester, December 15 to 17th. The attendance was smaller than usual yet very select, and the program was commendable and interesting. A show of hands at one session evidenced that about half present were actual milkers, and others were interested in activities of which the dairy cow is the center. The dairymen found the latch string at Rochester hanging out, and a royal welcome was extended, and a sincere invitation for the dairymen and breeders to return was expressed by both Mayor Egerton and Secretary Woodward of the Chamber of Commerce.

President H. C. Elwood of the State Dairymen's Association explained the absence of features from the meeting. He said in part: "We have been obliged to call off the cattle exhibit and cattle sale. What to do was the next question; we had solicited far and wide, the different supply houses to come here and take space and help fill up the large buildings, but we could not feel that it would be wise to continue to ask those men to make a dead exhibit."

Commissioner Calvin J. Huson, President of the State Breeders' Association, said concerning the meeting of the dairymen and live stock men of the State meeting together for first time in the history of the State, "There never was a time when there were greater questions to be considered, or greater issues to be determined. We have several important questions to come before the Legislature, and it is important that the producers of milk should have a voice in determining policies." A full report will follow.

Government Crop Report.

The final estimates of the Department of Agriculture are:

	Acreage	Yield bu.	Farm Val. bu.
Corn	103,435,000	2,762,804,000	.63
Wheat	53,541,000	891,017,000	.986
Oats	38,447,000	1,141,060,000	.438
Barley	7,565,000	194,953,000	.543
Rye	2,541,000	42,779,000	.865
Buckwheat	792,000	10,881,000	.764
Flaxseed	1,885,000	15,559,000	1.26
Rice	693,000	23,649,000	.924
Potatoes	3,708,000	405,921,000	.489
Sweet Potatoes.	603,000	56,574,000	.73
		lbs.	lb.
Cotton	36,722,000	7,983,000,000	.068
Tobacco	1,223,000	1,034,679	.098
		tons	ton
Hay	49,145,000	140,142,000	11.12

The yield of all crops except flaxseed and rice is in excess of last year. In farm value December 1, corn was 5.4 cents lower than last year; wheat, 18.7 cents higher; oats 4.6 higher; barley, .6 cent higher; rye, 23.1 higher; buckwheat, .9 cent higher; flaxseed 6 cents higher; rice, 6-6 higher; potatoes, 19.8 cents lower; sweet potatoes, .4 cent higher; hay, $1.31 per ton lower; cotton, 5.4 cents per lb. lower; tobacco, 3 cents lower.

The final estimate for wheat is about 900,000 bushels under the earlier figures, and corn 30,000,000 bushels under. The rye crop is only 1,398,000 bushles under last year, yet such a large part of the supply is at seaboard points awaiting export that the proportion available at interior points is unusually small, causing an abnormal rise in price.

Woman and the Home

From Day to Day

THE NEW YEAR COMETH.

This is the time of sadness and farewell,
The time of welcome and of new delight,
The old year drifts upon the wind to-night
Into that limbo where the dead years dwell,
From some strange, distant bourne no tongue can tell,
O'er moonlit ways and paved with shining white,
The new, swift-footed year—a vision bright—
Comes at the clamor of the old year's knell!

Time turns his glass! The sands full slowly run,
Freighted, in each dropped grain, with memory—
The failures wrought, the few successes won!
I cry. "O Time, what brings the new for men?"
The brave-tongued bells peal answer back to me.
"A chance to fail; a chance to try again!"

—Charles C. Jones in Lippincott's Magazine.

*

GLASS measuring cups, marked with little ridges to show the quantity, are especially convenient because it is so easy to see just how much one has poured in, especially when one is measuring liquids. Other convenient measuring cups are of tin and agateware.

*

HERE is a simple but well-recommended recipe for maple fudge: One pound maple sugar and one cup milk. Bring to a boil and add a tablespoon of butter. Cook until it becomes brittle when tested in cold water. Remove from the fire, stir vigorously until it begins to granulate around the edge of the kettle and then pour into a buttered pan.

*

AN odd way of cooking eggs entirely new to us, was recently given in the *New York Tribune;* it was called eggs in ball shape. Heat lard very hot in a small kettle, as for crullers, and then stir the fat round and round with a spoon, till it whirls. Drop the eggs in, as if for poaching, one at a time; the whirling motion of the hot fat forms them into balls, and they are quickly browned to a delicate color.

*

THE most practical laundry bag is one made of two yards of cretonne, gathered at the top on to an oval embroidery hoop, a wooden one 10 or 12 inches long. With this oval top one may always throw things in, without trouble, when it is hung up in a convenient closet. Nursery laundry bags sold in the art needlework departments for children's use, are of plain colored linen, ornamented with Mother Goose figures embroidered in outline or cross-stitch. A child is more likely to pick up and put away soiled clothing when provided with a bag for the purpose, thus forming habits of tidiness that mean much in later life.

*

"CANNING clubs in New York State," Parts I, II and III, are issued in the Cornell Reading Course, and will be found valuable not only to those who wish to work into the business commercially, but also to the housekeeper whose canning is only for family use. Part II gives "Principles and Methods of Canning," while Part III is devoted to "Canning Equipment." Part III answers many questions asked by those who wish to begin commercial canning in a small way, while Part II, in addition to the information it gives as to the basic principles of canning, includes many canning recipes. Better study these bulletins during the Winter, and then file them away carefully for the working season next Summer. This brings to mind the utility of filing cases; we wonder how many of our readers make use of this convenience for bulletins and similar reminders. The ordinary letter file, 12x11½x4 inches, is convenient for bulletins; they are then stored alphabetically, and the file placed on a shelf or in a bookcase, where the information so often needed is always accessible, and rarely mislaid.

The Rural Patterns.

In ordering, always give number of pattern and size desired. Price of each pattern 10 *cents.*

8469A shows an attractive redingote gown of serge and satin. It may be made of one material only if desired. For the medium size the gown will require 4½ yards of material 27 inches wide, 3½ yards 36, or 3 yards 44 for

the redingote, with 4½ yards 27, or 3¼ yards 36 or 44 for skirt, sleeves and vest, or 8½ yards 27, or 6¼ yards 36 or 44 with ¾ yard of any width for vest to make as shown in back view. The pattern 8469A is cut in sizes from 34 to 42 inches bust measure.

7971, Infant's Bishop Dress. One size. 7571, Girl's Guimpe with set-in sleeves Perforated for yoke facing in round or square outline or for round or square neck, with long, three-quarter or short sleeves. Sizes, 4 to 12 years. 8371, Gathered Blouse. With long or three-quarter sleeves. Sizes, 34 to 44 bust.

7164, Men's Outing or Negligee Shirt with Coat Closing. With attached turnover cuffs and soft collar or neck-band. Sizes, 34 to 46 breast. 7396, Boy's Outing Shirt. With soft collar or neck-band and separate high collar, with straight or rolled-over cuffs or wristbands, with or without coat opening. Sizes, 12 to 16 years.

Seen in New York Shops.

STOCKINGS having tape-bound button-holes in the top, for the stocking supporter, are a novelty that seems very practical as it will prevent any risk of the ordinary tearing.

Among unusual supplies for florists' use are natural butterflies, moths, beetles and other insects, preserved and mounted upon pins. They are to be used on baskets and other decorative arrangements of flowers.

Women's "anklet leggins" are like a long stocking without a foot. They are meant for wear when driving, motoring, golfing, etc. Knitted in dark wool they cost 98 cents a pair. Any one who can knit the leg of a stocking could make them, and they would be a great comfort on a cold country drive.

A new sort of fuel for chafing dishes is called "solid alcohol;" it is sold in tins that fit into a special lamp. It is said to be safe from risks of accident.

Loose flowing veils of filet or octagon mesh, with borders of velvet or chenille dots, are among new fashions, and are quite becoming. They are worn both with little close toques, and with wider brims. One of the popular toques, usually called the Tipperary, is a small, close, military shape with a narrow line of fur around the top of the crown. A new veil for wear with this is edged with fur to match the hat, the fur edge of the veil being drawn close around the throat. The hat is made of corduroy or velvet in all fashionable new colors. One color much used in millinery is a vivid cerise, rather brighter than American Beauty or Nell rose.

Many of the little girls' styles seem more grown-up than they have been for some years, for they actually have shirt waists and separate skirts. However, there is a great difference between grown-up blouses and the little "Oliver Twist" waists for small girls. Now the shops are selling separate pleated skirts for girls as young as five years, in blue serge and plaid. They are pretty and useful with a middy blouse.

So many fur sets consist of a muff made up with satin or velvet, and a small, close scarf or collarette, that it gives a good opportunity for making over worn furs. One style of muff desirable for making over is a moderate-sized pillow shape with a puff of velvet at each end narrowing into a small band of fur. The neckpiece is a close band with a standing ruche of velvet at the back.

Caps and scarfs to match the sweater are offered in great variety for grown-ups as well as children. The scarfs or mufflers are very useful when driving or motoring and are knitted and woven in silk or wool, and also made in fleecy angora. Some of the sweaters in angora or brushed wool have a fringed sash belt to match the scarf. What are called motor or skating sets consist of the sweater, cap and scarf.

"Dorothy" Shaker cloaks of broadcloth, with silk-lined hoods, are sold for motoring, driving and traveling, also for evening wear.

"Door porters" are the weights or door stops used for holding a door open. They are in vogue again now, and are offered in a great variety of styles, made of brass or iron, as well as decorated figures wth a weighted base. A handsome brass door porter is a dolphin 14 inches high, costing $9.

A plain but very fashionable blouse of putty-colored Georgette crepe has a slight fullness falling from hemstitched shoulders, and long, set-in sleeves gathered into cuffs with pleated ruffles that fall over the hands. A high stock closely buttoned at the front has a turn-over pleating slightly wired at the back. On the front was a trimming of black beads, put on like three military frogs.

The new high neckwear takes many forms, and much of it is very plain. The high stock is finished with all sorts of turnover collars. Some turn down flat at the sides and then flare suddenly upwards at the back. Others have a deep roll section at the back, or a turn-up pleating; some have merely a flaring point at each side. One pretty model of white organdie had deep turn-down points at each side, two deeper points at the back, and a narrow black moire cravat running round it at the base, tied in a little bow between the two deep points at the back. A favorite model is a chemisette with a high rolling collar at the back, while in front two points turn back to show the throat. Tiny buttons, crocheted, satin, pearl, glass and metal, are freely used to trim stocks and chemisettes.

When you writo advertisers mention The Rural New-Yorker and you'll get a quick reply and a "square deal." See guarantee editorial page. : : : : : :

Better Light and More of It

KEROSENE light is best for young eyes and old eyes alike. The Rayo lamp gives you kerosene light at its best—a steady, generous glow that reaches every corner of the room.

The *RAYO* does not smoke or smell. It is made of solid brass, nickel-plated. It is easy to light, easy to clean, easy to rewick. At dealers everywhere.

New York Albany Buffalo Boston

ONE DOLLAR buys 150 envelopes and letterheads. Cards, tags, labels, either, 125, 50c.; 300, 90c.; 500, $1.40; 1,000, $2.40. We prepay express. Chatham Courier Co., Chatham, N. Y.

For One New Yearly Subscription, or Ten 10-Week Trial Subscriptions, or Three (3) Renewal Subscriptions (one of the three may be a renewal of your own subscription).

This "American Maid" non-breakable Rag Doll. It is 14 inches high, patented compressed fabric face, stuffed with pure, clean cotton. Pretty dress; indestructible and sanitary.

The Rural New-Yorker, 333 West 30th St., N. Y.

Cornmeal Recipes and Baked Beans.

LOYAL to New England tradition, I like to have on my Saturday supper table every week in cold weather a pot of beans, hot from the oven, and a steaming loaf of brown bread. For the loaf I generally use the old State of Maine recipe, "Togus brown bread": One cup sweet milk, two cups sour; two cups Indian meal, one cup flour, one-half cup molasses, one heaping teaspoonful soda, one scant teaspoonful salt. Steam three to four hours. The batter is very thin, A variation of the recipe furnished me years ago by Mrs. Nichols of Round Pond, Maine, makes a larger loaf, equally as good: Three cups sweet milk, one cup sour; three cups Indian meal, one cup flour; one cup molasses, one heaping teaspoonful soda, salt. Steam four to five hours. If I have no sweet milk to spare, but have plenty of clabbered milk, I use three cups clabbered milk, one-half cup molasses, two level teaspoonfuls soda, two cups Indian meal, one cup flour, a scant teaspoonful salt. If I happen to have no milk of any kind on hand I use a recipe given me for just such an emergency by Mrs. McFarland of Wiscasset, Maine, and it makes very good bread: Put two cups meal and one cup flour and pinch of salt into mixing bowl, make a little concavity in the mixture at the bottom of the bowl, and pour into it one-half cup molasses. Stir carefully into the molasses one teaspoonful soda and then one tablespoonful vinegar and stir all into the meal and flour. Make the right thickness with cold water. The batter must be a little thicker than the batter of milk-mixed brown breads and must be steamed three to four hours. In any of these recipes one cup of rye meal may be substituted for one of the cups of Indian meal.

To make raisin brown bread use two cups sour milk, no sweet milk nor water; two cups meal, one-half cup flour, one-half cup molasses, one-half cup raisins, one heaping teaspoonful soda, salt, and steam three hours. I steam my brown bread in a well-greased, covered lard pail filled two-thirds full, and set in a steamer over a kettle of boiling water which must be kept boiling all the time the loaf is in, and when it needs renewing, only boiling water must be added. If one has not a steamer, the covered pail of batter may be set on an iron flat-iron rest, or something of the kind placed in the bottom of a kettle of boiling water, the water to be kept to within a few inches of the top of the pail. After the loaf has steamed the proper length of time uncover the pail and invert it over a plate and let it remain a short time, for there is danger of breaking the loaf if one attempts to remove it too soon. A clean string, I find, slices the loaf when hot, better than a knife, as the hot bread is apt to stick to a knife.

The batter for brown bread that is to be used cold for sandwiches should be a little thicker than the "Togus" batter, and it may be steamed if one fancies the shape, in one-pound baking-powder cans, well-greased. Cut the little loaf when cold in circular slices, spread one slice with an appropriate filling and another with softened butter, press the two together and cut in halves.

What is left of the pot of beans Saturday night I warm up, adding a little water, for another meal, and if there is not enough of the loaf left over to heat by a few minutes steaming and serve with the warmed-up beans, it takes but half an hour to mix and bake a "Mrs. Travis johnny cake," which is made by the first recipe for Togus brown bread, substituting one cup of sugar for the half cup of molasses. Halve the recipe and bake the thin batter in two pie tins in a quick oven. This is very fine when properly mixed and quickly baked.

When eggs are cheap I like for breakfast "Dixie spots." Scald as many cups as you like of cornmeal with as much really boiling water as the meal will take up without making a batter, let it cool, then beat in for each cupful of meal used one egg and one tablespoon sugar and a pinch of salt. Thin with milk sufficiently for the batter to spread a little when it is dropped from a spoon and bake slowly on a well-greased griddle, browning both sides a little. I use a slice of fat salt pork to grease the griddle. My experience is that cottonseed oil compounds leave a coating on a griddle that is not easily removed.

I am indebted for my recipe for "toads" to Mrs. E. B. Brown of Rhode Island. They somewhat resemble toads in shape, after frying, and make a good breakfast dish in cold weather for a man who is going to work out of doors all the morning. Scald two cups Indian meal, add one cup flour, one egg, salt, milk enough to enable taking out with spoon. Fry in deep hot fat, and serve as soon as fried.

My recipe for old-fashioned Indian pudding came from a Methodist minister's wife, Mrs. W. W. Ogier, then of Round Pond, Maine. Scald one quart of sweet milk (I think skim-milk, the oldest one can get that is perfectly sweet, is best for this pudding, for it makes a better whey to jelly when cold); mix six tablespoons cornmeal with a little cold milk and pour into the scalding milk, stirring till it thickens. Then pour all into a two-quart baking dish and add one cup molasses, one scant teaspoonful salt, piece of butter size of a walnut and one cup cold milk. Spice with cinnamon and a little ginger. Sweet apples sliced, or raisins improve the pudding. Bake in a medium oven three to four hours. Stir while baking and add another cup of cold milk. To be eaten hot with butter or cold with cream.

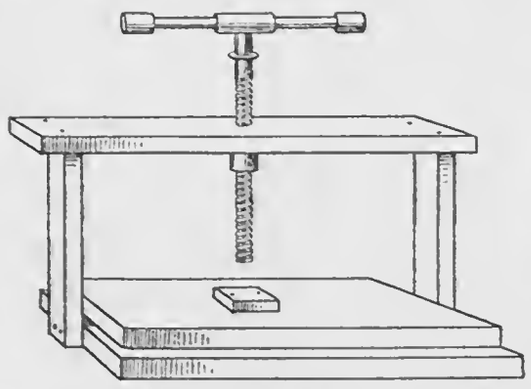
I will end as I begun, with the pot of beans, and give my recipe for baked beans, which turns out a dish that never goes begging. Friday evening, pick over and wash carefully one quart of beans, either the small white pea beans, or better, the old green-eyed variety, and put them to soak in plenty of cold water. Saturday morning, about nine o'clock, rinse the beans in fresh water and put them, without parboiling, into a two-quart covered earthen bean pot, and bury near the top a chunk of salt pork, three-fourths of a pound, well-washed, the rind parred off, preferably a chunk with "a streak o' fat and a streak o' lean." Then add to contents of bean-pot one teaspoonful mustard, one-fourth cup sugar, one-fourth cup of molasses and one to two teaspoonfuls salt, according to the saltness of the pork used. Fill the pot with hot water, put on the cover, set in a moderate oven and bake till the supper hour, adding hot water occasionally to keep the beans just covered. Add water for the last time an hour or so before serving. I bake my beans about nine hours. LOUISE PRINCE FREEMAN.

An Ironing Machine.

AT a cost of from 50 to 75 cents, the boy of the family who is interested in carpentry may make a press that will iron sheets, towels, pillow slips and all flat pieces, over night, without heat or labor. In the construction of the machine, the following materials are required: Three feet of 2x12 plank, five feet of 2x4, a bench screw, eight or 10 twenty-penny spikes, two screws, some pieces of heavy cloth and a few carpet tacks.

UPPER BOARD OF PRESS. FIG. 663.

Saw the 2x12 plank in two—making one piece an inch longer than the other—and cover the smoothest side of each piece with heavy ticking or blanket, tacking the covering snugly around the edges. Lay the longer piece, padded side up, on



THE PRESS COMPLETE. FIG. 664.

the work bench, and spike to the middle of each end an upright of 2x4 14 inches high. (If the bench screw is less than 14 inches long, the uprights should be shorter.)

Exactly in the middle of a two-foot piece of 2x4 bore an auger hole that will admit the bench screw, which latter need not be over an inch in diameter. Lay the nut over the hole and fasten to the 2x4 by screws through the ears. (Fig. 663). (The nut can be reversed and sunk into the 2x4, if the auger hole is made large enough, but this is more trouble.) Now turn the 2x4 over, with the nut down, and spike it to the top of the two uprights.

Next, lay the shorter piece of 2x21 padded side down on the work bench, and nail to the center a block of 2x4, to serve both as a handle and for the end of the screw to bear on. Over the padded sides of both planks tack a second covering of muslin or white blanket, place the padded surfaces together, insert the screw in the cross piece, and the press is done. (Fig. 664).

The pieces to be ironed in the press should be neatly folded as soon as taken from the line. Four or five sheets may be pressed at once, or their equivalent of small things, laid in a regular pile. By this method, sheets, towels, etc., retain their creases better than those pressed with an iron; they also retain the "freshness" which the heat of ironing tends to destroy. Handkerchiefs and napkins, if folded twice, when taken from the line, and left in the press a few hours, may be finished with two or three strokes of the iron, without unfolding or dampening. They are firmly creased and look like new. S. R. QUIGLEY.

Husk Tomatoes.

IN answer to inquiry about husk tomatoes, they are very good preserved with sugar enough to make a moderately thick syrup, with slices of lemon and ginger root to flavor. Seal in cans. I put half beach plums and half husk tomatoes together and canned this year, and they are most delicious. M. F. W.

Canned Tomato Soup.

IN the November 28th issue the recipe for a canned vegetable soup is asked for. I have a good canned tomato soup which will keep all Winter. When a can is opened meat stock may be added or not, as one likes, or a little boiled rice is nice to add. 14 full quarts ripe tomatoes cut up, 14 stalks celery, 14 sprigs parsley, 14 bay leaves, seven onions, 12 cloves, 10 level teaspoons salt, two level teaspoons pepper, seven pepper corns, three-fourth cup sugar. Cook the above three hours and strain; melt ½ pound butter, stir in 1½ even cups flour, mixing it smoothly, add to the other ingredients and return to stove and boil 15 minutes; seal in cans. M. C. K.

Jelly-Making Suggestions.

IF you wish to give apple and quince a beautiful red color use a few sweet apples with each, and cover and cook juice for at least half an hour in oven before adding sugar. Even better results are obtained by cooking these fruits covered in oven before straining. Cook barberries, cranberries and grapes a long time and then again after straining through double cheese cloth bag over night before adding sugar. Do not expect to have clear "quivering" molds of jelly if you boil the fruit and sugar into a preserve. Do not fail to cook juice after straining. Cook but a few minutes after adding sugar, always heating sugar hot in oven. Following these rules your jelly will "jell." B.

For Hunters—Trappers—Farmers—Automobilists, Etc.

THE BALDWIN CARBIDE LAMP
Generates and Burns Acetylene Gas

Makes night hunting and fishing greater sport than ever.
Throws a wide circle of light 150 feet on the darkest night. More powerful than electric light. Makes night driving, hunting or boating safe. Can be carried as a hand lantern or worn on the cap or belt, leaving both hands free. Fine for working about machinery, repairing punctures at night, hunting stray cattle, etc.

TRY THIS LAMP FOR TEN DAYS
Order a Baldwin from us or your dealer. Use it for ten days. If not entirely satisfied, return the lamp and we will refund your money. Your dealer is authorized to make the same arrangement with you.

FREE TO YOU
Send us your dealer's name and we will mail you our very instructive booklet, "Knots and How to Tie Them." You should have this. The illustrations show you how to tie many kinds of knots.

JOHN SIMMONS CO.

STATE BUREAU OF IMMIGRATION,
62 Hoffman Building, Baltimore, Md.

Yes, waiting for every farmer or farmer's son—any industrious American who is anxious to establish for himself a happy home and prosperity. Canada's hearty invitation this year is more attractive than ever. Wheat is higher but her farm land just as cheap and in the provinces of Manitoba, Saskatchewan and Alberta

160 Acre Homesteads are Actually Free to Settlers and Other Land at From $15 to $20 per Acre

The people of European countries as well as the American continent must be fed—thus an even greater demand for Canadian Wheat will keep up the price. Any farmer who can buy land at $15.00 to $30.00 per acre—get a dollar for wheat and raise 20 to 45 bushels to the acre is bound to make money—that's what you can expect in Western Canada. Wonderful yields also of Oats, Barley and Flax. Mixed Farming is fully as profitable an industry as grain raising. The excellent grasses full of nutrition, are the only food required either for beef or dairy purposes. Good schools, markets convenient, climate excellent. Military service is not compulsory in Canada but there is an unusual demand for farm labor to replace the many young men who have volunteered for service in the war.

Live Stock and Dairy

THE FRENCH-CANADIAN HORSE.

FOR some time I have been interested in the breed of horses known as Canadian horses or 'Canucks." These horses were once quite common around here; I am anxious to secure one of them.
Barbourville N. Y. R. Y.

The French-Canadian horse is deseended from Norman-French stock, though more or less of mixed breeding, standing generally little more than 15 hands high, and weighing from 900 to 1,100 pounds. He is a very courageous looking animal, with his lion-like mane and his bushy tail and fetlocks. The feet are tough and almost immune from disease. His hardiness and ability to thrive under most adverse conditions are notable characteristies. The writer possesses a half-bred French-Canadian mare now 25 years of age, whieh plowed every day in a team with a four-year-old, last Fall, without any apparent weakness or fatigue.

These animals, aceording to Dr. C. A. Coutre, seeretary of the French-Canadian Stud Book, Quebee, deseended from those sent out from Franee, before the eonquest by Louis XIV, "who liked to do things in a grand way," and sent to Canada only the best animals of the kingdom. "On 16 July, 1665, there were sent to us 20 mares and two stallions from the royal stables. Others were sent us in 1667, including a stallion and two mares for the Ursulines. In 1670 11 mares and a stallion were landed at Quebee; other shipments followed."

The French-Canadian horse is probably the best general-purpose horse raised in Canada. He fills this position to a much greater extent than any other breed. He is fairly speedy but not extreme, though my mare, when younger, would go in less than three minutes to a road wagon. He, however, prefers a reasonable gait. He will go on all day, but does not eare to keep up extreme speed. The Freneh-Canadian crosses well with the Clysdale. I have seen some excellent horses from erosses of the French-Canadian stallion on the grade Clyde mare. For further information communicate with Dr. J. A. Coutre, Societe Generale des Eleveurs de la Provinee de Quebec, 49 Garden street, Quebec, Canada. J. A. MACDONALD.

GOOD AYRSHIRE RECORDS.

Somehow no one seems to think of the Ayrshire cow as a large producer of milk. We speak of her as a good, servieeable animal, active and vigorous, but somehow it is not generally known that there are Ayrshires with heavy records. C. M. Winslow, secretary of the Ayrshire Breeders' Assoeiation, sends out a summary of the advaneed registry for Ayrshires. The following figures give the average of the cows or heifers exeept, of course, the individual record where only one eow is mentioned. It appears from this that the Ayrshire is a heavy producer as well as a very serviceable animal:

Summary of Advanced Registry.

Average yield of milk and butter of all cows and heifers that have qualified for advanced registry to Oetober 1, 1914:

		Lbs. Milk.	Lbs. Butter.	P. C. Fat.
503	Mature eows..	10,576	481	3.81
189	Four-year-olds.	9,692	444	3.9
251	Three-year-olds	9,002	417	3.94
419	Two-year-olds..	7,871	371	4.
1,362	Total cows and heifers	9,339	430	3.91

Average of ten highest reeords in each class:

	Lbs. Milk.	Lbs. Butter.	P. C. Fat.
10 Mature eows	18,841	867	3.9
10 Four-year-olds ...	14,117	652	3.93
10 Three-year-olds ..	14,083	648	3.91
10 Two-year-olds ...	11,957	581	4.14

Individual reeords.

	Lbs. Milk.	Lbs. Butter.	P. C. Fat.
1 Mature eow gave..	23,022	1,080	3.99
1 Four-year-old gave.	17,657	966	4.65
1 Three-year-old gave.	15,121	631	3.55
1 Two-year-old gave.	14,495	644	3.78

WATCH YOUR DAIRY COW.

"WOULD you stand for it year after year?" was the question F. H. Scribner, of Wisconsin, put to farmers in demonstration talk at the Dairy Show, "if your thrasherman would try to economize in fuel and run on just enough steam to turn the separator. No sir, the thrasherman would get orders to go on, if he just fed in fuel enough to turn the wheels. The engine would die when a fraction of eapacity would be approaehed. You would be paying your men for the day's work, your expenses would be just as high for labor, you would be getting only a fraetion in results, while there would be saving a few pennies at the power end of the machine. The thrasherman wouldn't get a job next year, and he wouldn't stand a ehanee among the neighbors."

Mr. Seribner said: "We draw out of the dairy cow in proportion to the amount we put in her. If we put in just enough to keep her going there is nothing eoming out in the bueket. If we heap in a little more fuel, just a shovelful of coal in the case of the thrasherman, we commenee to see results. A good many of us feed and then run away. Good, eareful, judicious, honest feeding is a trade all by itself. We must study every individual in our herd. We must stand by and watch our cows, we must watch them from three points of view, in front, behind and in the middle. From in front I want to watch my cows eat; I want to see them eat with relish; I want to wateh them behind. One morning I notieed no droppings behind a eow. It was a danger signal, and we gave her immediate attention, and in a short time she was baek at her plaee produeing results.

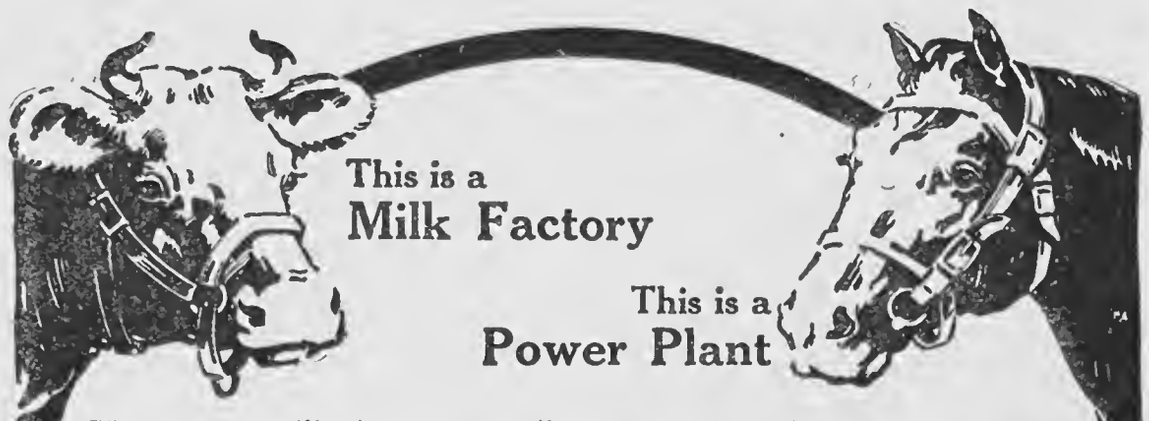
"We want to wateh the middle," Mr. Scribner emphasized with a foreible gesture. "I would not know how to feed my cows, without a milk sheet in the barn. For example, one eow may become a little poor; if so, feed her more eorn, for that will stick to her ribs, or if she is running more to meat, I feed her less eorn, and I have other similar practiees.

W. J.

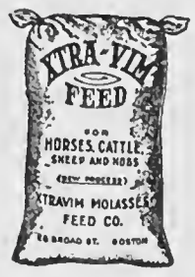
Cottage Cheese; Buttermilk.

CAN you tell me how cottage eheese is made from separated milk? What price does it retail for, delivered from house to house? Also I should like to know the retail priee of buttermilk delivered the same way? D. B. H.
Vermont.

The skim-milk should sour until loppered. Then heat over water or steam until the whey separates from the curd, and drain through a sieve or colander. The milk should be stirred frequently while heating, and removed as soon as the curd becomes sufficiently firm for draining. Too much heating makes the cheese hard and rubbery. After draining salt to taste. I eannot give the exact amount of salt neeessary but I think it can readily be determined by experiment. A little butter or cream improves the quality of the eheese. I am not familiar with the retail price of cottage cheese, but I should think one should get at least 10 cents per pound, and more if the trade will bear it. Buttermilk retails at three to five cents per quart, sometimes even higher. C. L. M.



This is a Milk Factory
This is a Power Plant
Your cows will give more milk, your horses do more work, and both keep in better condition, when you cut down their high-cost, war-priced grain and chop feeds and substitute lower-cost
XTRA-VIM FEED
Pure Porto Rican cane molasses and sphagnum moss combined in a new, clean, handy, dry form. Practical stock feeders have proved the high feed values and good conditioning qualities of this combination for all kinds of live stock. Animals love it and thrive on it—make more weight, give more milk, do more work. It is a cheap feed, for it takes the place, weight for weight, of higher-cost feeds, such as corn, oats or chop. Dry to the touch—about like bran—no waste in handling, and eats up clean without "mussing" animal or manger. Try it and watch your animals improve!



(In 100-lb. Bags)

HOLSTEINS AS BEEF CATTLE.

A HOLSTEIN cow will consume enough food above her own maintenance to produce 1,758 pounds of milk solids or over three times as much as an average beef steer will gain in body weight in one year. Interest is directed to this fact by the Holstein-Friesian Association, and in calling attention to the beef-producing qualities of the breed, they contend that contrary to the general belief, large and profitable beef and milk production are correlated to an astonishing degree. The greater the milk producing qualities, the more perfect the work of assimilation and digestion, the larger and the more economical the gain of body weight when dry, the stronger the constitution, and the more regular the breeding, all of which qualities also tend to make beef producing more profitable.

It is further contended: "A Holstein steer inherits from its dam a capacity for assimilating a quantity of feed which would make the average beef steer sweat merely to look at it. The fact is that while up to about 18 or 20 months of age a Holstein steer will have approximately the same conformation and quality as a beef steer yet after that age he begins to partake more of the dairy form." Reference is made to Iowa results in which Herefords, Angus, Holstein and Jersey steers were compared. "The Holstein steers made an average of $14.87 net profit for the wholesaler, while the Angus averaged $9.25 and the Hereford $5.13. The average cost of a pound Holstein gain was .0712 cents the pound, while that of the Hereford was .076 the pound. Nebraska has found that Holstein gains are very satisfactory. "The principal objection to the Holsteins for production of beef is the fact that they are very slow to fatten and must be kept in the feed lot for a longer time than is ordinarily needed by beef breeds. This could not be a very serious objection to Holsteins for beef, for according to Nebraska's own experiments only 60 per cent. of the Holsteins had to be kept over an extra six weeks in order to have them sufficiently fat for market, while 66 2-3 of the total lot had to be kept over." W. J.

A STATEMENT OF "INBREEDING."

IT is possible that the editor of THE R. N.-Y. remembers seeing a somewhat likely flock of 20 Plymouth Rock hens, when some years ago he was a visitor at the writer's home, and his favorable comments upon their type and appearance. They were notably large, finely marked, robust hens, and in appearance one was about a duplicate of the others, and great layers as their chief recommendation. They traced back to a setting of eggs from a noted flock, and for the succeeding generations, not a drop of fresh blood had been introduced. Every two years, the most promising cockerel had been selected as a mate, and this plan followed year after year. Each year, the birds grew slightly larger, maintaining the most perfect health. Each year when the little chicks appeared, they, with their "mother," were taken to the loft on the big floor over the milking stable, and there fed and cared for, for at least three weeks. There they ate their food, scratched and dusted in the orts, knew no pips, or other chick ills, and went out lusty foragers. When a cockerel, or hen, was killed, the board was graced with abundant and fine meat, nor did it need two birds for a meal. Alas and alack! One morning every hen but one had departed to mingle with the activities of the not distant city, so we are compelled to say that this close in-breeding did cause them to "run out," and actually disappear, but no one can make the lady who cared for them believe that any other plan of maintaining a flock of hens is better than her plan of shutting out the out-crosses, and fresh blood; and breeding from the best you have, when you know that nothing better can be found outside the farm.

Within almost sight of the writer is a herd of Holstein cows, bred exactly the same way, only the hens had a dozen eggs as a foundation; and this herd was started from one cow, and she is therefore the grandmother of all the succeeding generations, which exclusive of all sales, now numbers quite 100 head. The original sire has been retained, and is therefore in his fifteenth year, the actual father of the herd. This herd is calculated to be the finest in the world viewed from any point, or angle, and numbers in its ranks quite a half-dozen of the champion butter fat cows known to official records. It will be noticed that the most intense in-breeding was done in both these cases, but not an instance where it was detrimental, and resulted in damage. Why should there be a prejudice against in-breeding? Like begets like, and if the type and health of the breeding stock is not allowed to deteriorate by unwise and inferior mating, there is no more danger of stock running out than that of our wild animals and birds that nature holds up to the standard by intense in-breeding.

Why not with our hens? Why not keep them purebred of standard color and type? When we introduced new, fresh outside blood, a new influence and heredity is introduced, and just what the "nick" will be, we do not know, and that is where we get the jumbled-up mixture of our common speckled hens, and no breeding will eliminate this mixture. Where fresh blood is introduced, the male can only give the half of what he possesses, practically only a fourth, so that the produce is in reality a purebred grade. Where the breeding is back to the sire, his blood influence is doubled, instead of being diffused. If the ancestors behind this sire are of distinctive qualities, and we keep these qualities in line, instead of diffusing them with fresh blood, fixed qualities become more substantially fixed, and we say that the heredity exhibited is of the most characteristic and transmittible quality.

The law of Mendel's is throwing great light upon the laws of breeding, and has shown that this plan of in-breeding is provocative of all sorts of ills; is without proof, but on the contrary, in the best breeding of hens, stock, horses, dogs, and the like, is found that in-breeding is universally practiced. All close-bred hens do not lay 205 eggs a year, but more do, than do speckled hens, standard bred (inbred) horses do not all trot in 2.01, but more do than mixed bred horses, and so through the list. The tenor of this article is to say that breeding in line such birds as possess the qualities we want, using a male bird of your own hatching that has the points you think superior, each year, and you will if you persist in this have a flock that will have few superiors, and will meet your ideal, though if you breed from only your very best layers, your hens may become in a few generations to have quite distinct formation and appearance from what will be accepted to-day as standard markings, and points, as indicated by the score card! But is there really any law like that of the Medes and Persians in livestock judging, that can know no change?

Ohio. J. G.

LITTLE GIRL (in disgrace, to mother, as she enters nursery): "Do you love me, mummy?" Mother: "Yes, darling." Little Girl: "Do you love me very much?" Mother: "Of course, darling." Little Girl: "Well, I've frown my pudden under the table."—London Punch.

WE TUBERCULINE TEST.
JOHN B. WEBSTER,
Dept. Y, Cortland, N. Y. *Bell Phone 14, F. 5.*

DON'T TAKE CHANCES WITH FOOT AND MOUTH DISEASE
Cortland County is clean and hasn't had even a suspicious case. We furnish certificate of health and tuberculin test. 300 high-grade Holsteins in our herd. Write for prices.
F. P. SAUNDERS & SON
Springdale Farm, - Cortland, N. Y.

Purebred Registered
HOLSTEIN CATTLE
We received 105,319 letters and communications last year. Each one was given prompt attention. People would certainly take no such interest in Holsteins unless there was a solid basis of actual value to justify it. Dairymen who are earnestly striving to secure the greatest possible return for the money and labor they have invested should get complete information concerning purebred registered Holstein-Friesian cattle. Don't you think you had better

FOR PRODUCTION—BREED UP, NOT DOWN—Registered Jersey bull calves, only, from producing dams and highest type sires. R. F. SHANNON, 603 Renshaw Bldg., Pittsburgh, Pa.

Jersey Heifers
My herd of 65 head, tuberculin tested in October. None reacted. Have about 20 head to dispose of. Two years old and under. For particulars apply to
J. Spencer Hosford, Kinderhook, N. Y.

It's different with
The Jersey

The State Dairy Instructor of the State of Maine recently said:
"One of the mysterious things about the dairy business is that a man can conduct a dairy all his life, losing money, and yet make a living."
But why run the dairy at a loss or to "make a living"? Why not make money?
By discarding "scrubs" and boarders and keeping the profitable Jersey the dairy farmer can do much better than merely make a living. Think it over. If you want to know what keeping Jerseys means, we have a good free book for you.

Immune Berkshires
both sexes, all ages, best of blood lines, good individuals. Our sale in August averaged higher than any sale held in the East this year. Breeding and quality did it. We have just purchased of Lucas and Gill, Huntland, Tenn., one of the best herds in the South. It includes their show herd that won first and Championship at Nashville, Tenn., this fall. Get your name in early for our February sale catalogue.
White Horse Farms, Paoli, Chester County, Pa.

LARGE YORKSHIRE BOARS
Ready for service; can make immediate shipment.
HEART'S DELIGHT FARM, Chazy, N. Y.

Butter Fails to Come.

I have a cow which freshened July 15, 1914, and up to about three weeks ago, she was making about six pounds of butter a week; now for some reason or other I can get no butter from the cream. It simply foams and froths and gets about like whipped cream, but I can in no way gather any butter. She is due to come in next July. C. F. A.
Flanders, N. J.

This question of "Why don't the butter come?" is a frequent one at this time of the year, and is a hard one to answer satisfactorily, because frequently when one has complied, seemingly, with all the requirements, still the butter won't come. Some of the conditions which work against easy churning are too low churning temperature, cows in advanced stage of lactation, and cows eating dry feed. Then, too, the milk from some cows seems to be rather difficult to churn. A thick cream generally churns easier than a thin cream, and well-ripened cream better than sweet or only slightly soured.

Warming the cream to as high as 70 degrees may in some cases be necessary. Care should be taken to stop churning as soon as the butter gathers sufficiently, in order not to make waxy butter. Sometimes, in cold weather, the cream cools off considerably after being put in the churn, and really is not as warm as one thinks. A handful of salt put in the churn when the cream gets thick, will sometimes help. In most cases warming the cream will solve the difficulty.

C. L. M.

AILING ANIMALS.

Worms.

WILL you advise me what to give a colt six months old that passes worms? 2. How best can I wean colt, either gradually or in three or four days? 3. I have a mare five years old that seems to have an itch. She wants to rub herself against something all the while especially after she has been working and gets warmed up a little. Her hair looks rough all the while, and seems to stand on end. She has a large appetite, but is poor in flesh. G. L.
New York.

1. Mix together equal parts of salt, sulphur and dried sulphate of iron and give one teaspoonful of this in the feed twice daily for a week, then skip 10 days and repeat. Feed whole oats and bran along with the best hay. 2. Wean at once and be done with it. The foal must first have learned to eat grain, bran and hay. 3. Wash affected parts with a 1-100 solution of coal tar disinfectant. Have her clipped. Give her worm medicine. That prescribed for the foal will suffice, but the dose is one tablespoonful night and morning for an adult horse. Omit iron if she is in foal. A. S. A.

Indigestion.

I own a fine road horse about 12 years old. He is a fine traveller and well bred and is used only for road purposes. For the last three months, he has not been doing well. He has lost in flesh and the color of his coat, although nearly shed, is not what it was. He rubs the dock of his tail. I have doctored him for worms, but unsuccessfully. I feed oats, bran, corn on ear, equal parts, with a little oil meal; also a good quantity of hay and some grass each day. Would you change the ration, and if so, how? The horse is in good spirits but his coat and flesh do not suit me. C. J. F.
New Jersey.

Have his teeth put in order by a veterinarian. Change the feed, omitting ear corn and grass. Feed whole oats with an addition of one-ninth part of wheat bran. Dampen it at feeding time. Do not feed any commercial salt, but allow free access to rock salt. Allow one pound of oats and bran and one pound of clear Timothy or upland prairie hay per hundred pounds of body weight as a day's ration at first. When he works hard increase the amount of oats and when idle lessen the oats and increase hay. Groom him once a day. Wash the tail clean and when dry pour on and rub in a little of a mixture of equal parts of kerosene and sweet oil. Repeat once a day for three days; then saturate the tail every three days with a creamy mixture of flowers of sulphur and sweet oil. If there is a fur of scaly substance around the anus treat for worms as so often advised here.

Azoturia.

Can you advise us in regard to our horse? We bought a mare last August, nine years old this Spring. She has just had her second attack of azoturia (so called by the veterinarian) since we have had her. Since this last attack she has been stiff in her right hind leg. When I start to back her out of the stall she will step back with her left hind foot and then she cannot seem to get the right one off the floor for a few seconds. After she has started she gets along all right, only once in a while something about it seems to "slump" or give way. The trouble seems to me to be up somewhere near the hip. She was absolutely sound before this trouble. She did not get down at either time she has had this trouble, neither has the muscle perceptibly wasted away because of it. The mare was not accustomed to grain and I fed some whole rye (about one quart) with two quarts whole oats, and Timothy hay. What is the trouble? O. W.
New York.

If azoturia was present it attacked the mare after she had stood for a day or more idle in the stable eating her usual rations, and the urine at time of attack would be the color of strong coffee. In lameness following azoturia the muscles of the region of the thigh, between stifle and hip, waste away and the stifle drops downward when the animal walks. If these symptoms are present clip the hair from the thigh and blister with cantharidine blister at intervals of two or three weeks until she goes sound. If such symptoms are not present it will be necessary to have a graduate veterinarian make an examination and locate the seat of the lameness and prescribe appropriate treatment. A. S. A.

Tail Rubbing.

I HAVE a colt three months old which is always rubbing its tail on posts, and boards. Can you tell me if it is possible this colt has worms of any kind, and what remedy to use? H. V.
New York.

Pin worms in the rectum may cause the irritation, or that may be due to a collection of dandruff substance. Wash the tail clean and then bathe with strong salt water twice a week. Inject into the rectum a quart of soapy water containing half a cupful of decoction of tobacco leaves or stems. Repeat the injection each night if the irritation persists. It would be best to make sure that pin worms are present before giving or continuing the injections. A. S. A.

Urticaria.

I HAVE a colt two years old, weighs about 1,250 to 1,300. Last year he suddenly developed knots all over his body. He went blind, that is, his eyes were shut, but he got all over it before night, and has been all right ever since. What ailed the colt? F. H. S.
Indiana.

The colt had a sudden attack of urticaria (nettle rash or surfeit) which is akin to "hives" of a child. It is caused by a change of feed such as green grass. A light physic should be given and the skin bathed with a solution of one ounce of granular hyposulphite of soda in a quart of soft water. A. S. A.

LIVE STOCK NOTES.

Why not a National Swine Show? This has been the hope of members of the Illinois Swine Breeders' Association. This matter was brought up at a recent meeting of the Illinois Breeders held in Springfield, and a later meeting earlier in December was held further to consider the National Show, which is to be patterned in a measure after the dairy show.

Tilly Alcartra, owned by the A. W. Morris & Sons Corporation, of California, is the new world's champion milk producer. This Holstein cow has 30,452.6 pounds milk to her credit in 365 days. Pieterje 2nd held the world's record milk production for nearly 27 years. February 23, 1888, she completed her year's semi-official test and her record was 30,318½ pounds of milk. Tilly Alcartra was six years old October 2, and she freshened at two and one-half years.

The American Jersey Cattle Club have voted a recent appropriation of $10,000 for the Jersey display at the Panama Pacific Exposition $5,000 had previously been voted in behalf of Jersey interests.

The Kansas Agricultural College has inaugurated a campaign to enlist 20,000 boys and girls in agricultural and homemaking contests. A state organizer has been appointed.

The Sicilian farm laborers are among the poorest paid workers in Europe. Their average weekly wage is less than 50 cents. Girls receive from $25 to $40 a year in Finland, and much of their work is about the dairy and in the field. They do all milking, feeding, and in the short Summers work in the fields.

Hancock County, Ohio, will have a contest supplementing the corn contest in that county. Prizes will be given for the best porker between the age of five and eight months in the Poland China, Berkshire, Chester White and Duroc Jersey classes.

THE Michigan Experiment Station is endeavoring to secure names of farmers who will seed Alfalfa in the Spring. It is intended to secure a carload of seed from the Northwest.

TWENTY California boys have been made happy as the result of their agricultural work. One boy made a profit of $45.44 on nearly three and one-fifth tons of tomatoes grown on one-fifth acre. Another boy cleared $12.76 on a quarter-acre beans which yielded 319 pounds. Another boy made $41.17 on one-fourth acre of potatoes, which yielded 71.7 bushels. Another boy had a net profit of $36.18 on one-eighth acre planted to mixed vegetables.

EDMONTON, Alberta, promises to be the live stock center of Western Canada. An English syndicate has secured a location indicated by the city council as desirable for stock yards. The company has offered the city a free site in the vicinity of the yards for a municipal storage plant, and abattoir.

FIVE hundred cars of table grapes were shipped from Sanger, California, this year, and many more cars are yet to be shipped. The Tulare Co-operative Poultry Association of that State shipped 4,500 dozen eggs during the month of October. In Tulare County $81,000 was paid ont by creameries during the month of October, and the returns for butter fat was from 33 to 37 cents a pound.

THE report comes from Alabama that one hog brought to town and sold a few days ago yielded more than a bale of cotton. It weighed 300 pounds and sold for $41, while the expense of raising it was much less than that of raising a bale of cotton.

Nov. 23. Wheat $1.05; oats 45; rye 80; corn 60; clover seed $7.50; clover and mixed hay $12; Timothy $12.50; Alfalfa $14. Fat hogs $7.25; fat cattle 6 to 7; milch cows $50 to $80. Potatoes 60; apples 70 to 90; butter 28; eggs 30. Live chickens 12 to 14. M. E. H.
Woodstock, O.

BUFFALO MARKETS.

QUOTED wholesale prices are not below 20 and 21 cents for dressed turkeys, 15 and 16 cents for fowls and 15 and 14 cents for ducks and geese but a large lot of dressed ducks and chickens sold at retail on the market for 16 cents, all looking as good as ordinary poultry. Live poultry is four cents lower than dressed. Apples and potatoes have not advanced. Local competition has brought down the Pacific coast apples till a city store now posts a notice offering "fancy table apples at 15 cents a dozen." Apples are $1.50 to $3 per barrel retail, good Seek-No-Furthers retailing at 50 cents a bushel. There is much effort to market them in bulk, to escape the effect of the new packing law, which makes the unbarreled fruit cheap. Potatoes are so dull that some farmers who were busy at other crops and have some still in the ground in December say they shall not dig them unless there is still some fine weather for the work, which is not likely. The wholesale price is not above 45 cents, 60 cents retail. One Erie County farmer reports that he had 12 acres of potatoes, 11 acres of corn, and 30 acres of grapes, all coming ready for harvesting at once, so the potatoes, being least perishable, suffered. The markets are full of celery; the quality is good, large bundles of it retailing for 25 cents, or 8 to 30 cents per dozen wholesale. The price of lettuce is also cut some on account of warm weather, and while the quoted wholesale price is 35 to 40 cents for two-dozen crates and some grocers are holding big heads for 30 cents, others are unloading it in miscellaneous lots for 10 cents. Vegetable oysters also retail for four cents a bunch. There are still some Catawba grapes offered at 12 cents per pony basket, wholesale, but California Tokays of fine quality retail for eight cents a pound. Cranberries are from eight cents down retail. Hubbard squash is as low as it ever was at this time of the year the wholesale price not being above $1 per hundred and the retail two cents a pound. The quality is good. Ordinary vegetables, parsnips, beets and carrots, retail at five cents a measure, string beans at 10 cents a quart, radishes, two bunches for five cents. Butter still sags off not being quoted above 35½ cents wholesale, though some retailers still ask 41 cents. Cheese is steady and unchanged at 17½ cents for best domestic. Eggs are all prices, quoted at 50 cents for fancy wholesale and selling for 30 cents retail. J. W. C.

Prevent Cattle Disease. Use
CHLOROZONE
The Standard Disinfectant. DO IT NOW
CHLOROZONE is one of the most valuable disinfectants and safeguards against diseases in cattle, hogs and sheep.

Soft and Firm Touch
That's the Empire touch that is revolutionizing the dairy industry. In the Empire milker the firm, sure grip of the human hand is most perfectly imitated. Not a hard pulling grip. Does not use compressed air. The gentle massaging of the teats keeps even nervous cows quiet and contented during milking time.

EMPIRE Mechanical Milker
The Natural Air Pressure System
produces a natural flow and even increases the yield. Requires but one tank and one pipe line. Your milker system will give perfect satisfaction from the start if you install the Empire. One double or two cow unit takes care of 20 to 30 cows per hour. Write for full description and pictures showing the milker in use in modern dairies. Let us show you how the sure, firm Empire teat cups do the work. Your own knowledge of milking will show it is the natural, perfect method.

The Henyard.

THE EGG-LAYING CONTEST.

THE sixth week of the contest at Storrs, ending Dec. 13, shows an egg output of 1,636. This is a gain of 174 eggs over last week, and is 674 more eggs than were laid in the corresponding week last year. The English White Wyandottes, entered by Edward Cam, take the honors again this week, with a score of 42; last week they won first place with a score of 43, and the week previous were second with 39 to their credit. This pen is now the leading pen in the total score, having laid 243 eggs. Windsweep Farm's White Leghorns are second in the total with a score of 221. In the week's score N. W. Hendryx's White Leghorns are second, laying 40 eggs and Storrs Agricultural Station's White Leghorns are third with a record of 37. P. G. Platt's White Leghorns tie with Merritt M. Clark's Barred Rocks, each laying 35, but Colonial Farm's R. I. Reds, beat them by one egg and take fourth place with a score of 36.

The contest at Mountain Grove, Missouri, closed Dec. 1. All previous records were beaten at this contest. A White Leghorn hen from Nebraska won the contest for high production by laying 286 eggs. Tom Barron's pen of White Leghorns won the grand championship by laying 2,296 eggs. Every bird but one in this pen, laid over 200 eggs. That is, nine birds out of 10 exceed 200 eggs. Mr. Quisenbury asks: "Why is it that some pens have a single bird that makes a very high record, and all the rest below the average?" And he justly says that the "high average of these English pens is due to the years of trap-nesting and selection of the best layers; to careful pedigree records, and matings with an eye to vigor and stamina as well as to high laying records." To which ought to be added, an absolute independence of the artificial "standard" set by the fancier. As the result, many of these English Leghorns have more or less "brassiness" in the plumage, they have large combs and high tails. They are the Leghorns Nature produces when she is not hampered. The trap-nest does not impose any artificial standard of comb or shape, or color, or tail. That this character of high egg production can be fixed so that it becomes the natural habit of the fowls, it seems to me is clearly demonstrated by the records made at all the contests, year after year. And this fact gives actual value above that of ordinary fowls, to male birds that carry this blood pure and unmixed. The week's record follows:

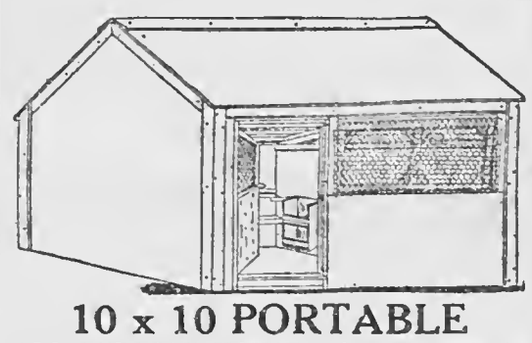
GEO. A. COSGROVE.

Keeping Old Hens.

I AM greatly interested in the article of M. B. D., page 1337. I myself sold a flock of yearling Leghorns this Fall because I did not have room for them, but I really believe it would have been better to provide the room for the best hens. It occurs to me that in connection with this question of production at different ages there is a very important point which should be investigated, as much will depend upon its solution as to the comparative value of the pullet and the older hen. That is, at what period of the season does the older hen produce her eggs, at the high-priced or low-priced sason? M. B. D. can doubtlss give us some information upon this question as his records must show. C. R. W.



10 x 10 PORTABLE

ALL PURPOSE HOUSE. Can bo made in units. Just right for brooders or brooder stove. Equally good for growing stock or laying hens. Also makes a nice camp, play house or woodshed. Made of ⅜ in. matched white pine lumber. Frame 2 x 3 sprnce. Weight 1,000 lbs.

PUBLISHER'S DESK

The *New York Tribune* came out recently with a guarantee of their advertisers. This is a step in the right direction. They are also starting a campaign against the patent medicine evil. The great majority of the patent medicines are believed to be frauds—and dangerous and worthless—leading to greater evil than the original trouble. The *Tribune* has first turned its attention to the so-called "consumption cures." It is estimated that $15,000,000 annually falls into the hands of swindlers on these fakes alone. The consensus of opinion in the medical fraternity is that all patent medicine venders who offer to cure this disease with their nostrums are swindlers; that the only known cure is rest, fresh air and good food under the drection of a competent physician.

Thomas A. Edison obtained an injunction yesterday restraining the Continental Chemical Company from using his name or picture in association with a "neuralgia cure" manufactured by the company called by them "Edison Polyform." The injunction was granted by Judge Rose, in the Federal court.

The Continental Chemical Company's product according to the inventor, is an outgrowth of a compound invented by him in 1879. At the time, said Edison, he believed this compound would cure neuralgia, and the rights were disposed of to a man named McMahon.

McMahon formed a company to handle the remedy, but failed. A Maine concern then took over the "cure" and also failed. Its successor, the Edison Polyform and Manufacturing Company, was enjoined in New Jersey from using the inventor's picture. He has since discovered, Edison asserted yesterday, that the compound has no value as a cure.—Tribune.

If a similar action were taken by prominent people in similar cases the unscrupulous would soon learn they could not cloak their fakes with respectable endorsements. Mr. Edison would make a good member of the Anti-Fake Club.

I see under the heading of Publisher's Desk of November 28 that W. K. R. is another victim of Harris W. Jennings, Springdale, Conn. I received an earnest quick order for 50 complete Langstroth hives. He seemed so honest an sincere I trusted him. Well, to this day I have not heard from him. What do you think can be done? He is the first man I ever dealt with who proved dishonest. I have learned my lesson. W. K. R. is fortunate that he lost only $5. H. J. G.

New York.

There is nothing can be done except perhaps a lawsuit, but the amounts involved are not large enough for that expense. The attention of the Post Office Department should be called to the matter.

If we all lived up to the creed of THE R. N.-Y. there would be no need of jails and hardly any for rulers. Let the good work continue. S. R. A.

Delaware.

That is one of the delicate compliments that comes to us at this season. All creeds are necessarily better than the people who profess them. It is easier to create ideals than to practice them; but so long as we aim at an ideal, we cannot go far wrong.

I come to you for help and advice. I sent, on February 1, 1914, to the Schuiling Rupture Institute, Indianapolis, Ind., $6 for one of their rupture locks, understanding and believing that I got it on 30-day free trial as per their advertising literature and their guarantee sent me as an inducement to order their locks. February 20 I wrote them that the lock did not hold. In reply they sent the same directions that come with the lock. I followed the directions up to the end of the 30 days, and then wrote them that the lock did not hold and I wanted my money, as per their agreement. Mr. Schuiling refuses to return it. J. B.

New York.

The guarantee issued by the Schuiling Rupture Institute, referred to by the above subscriber, reads: "If, after the expiration of the 30 days, it does not come up to our claims, we will refund your money and you may return the rupture lock. What can be more fair than this. Therefore, you should not delay a moment to order the Schuiling rupture lock."

From the statement of the subscriber, he seems to have complied with all the conditions of the 30-day free trial offer. We have taken this case up with the Schuiling Rupture Institute by correspondence, and the proprietor flatly refuses to refund the subscriber's money. It is the contention of Mr. Schuiling that this customer kept the lock beyond the 30 days' limit. From our record of the correspondence, it would seem that he made the demand for his money within 30 days from the time he received it, and at any rate, the literature specifies, after the expiration of the 30 days, and not within the 30 days' limit. The subscriber complained that the truss did not hold 20 days after the date the order was given. We entertain our own opinion as to the sincerity of the proposition, and we have no hesitation in advising patients to consult their local physicians and be governed by their advice, and above all to avoid free offers of every kind.

Dr. Richard C. Flower, swindler par excellence, weak, emaciated and a hopeless victim of morphine, was sentenced to two years in the penitentiary today by Justice Davis in the Criminal Branch of the Supreme Court. Justice Davis said:

"Flower, your career as a thief has been conspicuous. You have brought untold suffering upon many people. I am told you are 70 years old and in poor health. By pleading guilty you have saved the State much expense. But the law demands that some punishment be inflicted upon you."

Flower was arrested in Toronto on Oct. 21, after he had been a fugitive from justice for 11 years. In 1903 he jumped a $23,000 bail bond. He was said to have cleaned up $1,000,000 through his activities as a mining stock swindler and lived in luxurious style. An attempt was made by his victims after his arrest to recover some of their money, but Flower laughed at them and said he had spent it all. Not one penny was ever recovered.—Exchange.

This ought to be final with Dr. Flower. What a record for a man of 70 years! Who will say that his millions and his luxury did not come high? The lesson to us is not alone the loss of the money entrusted to his swindling hands, but the degree of responsibility assumed by credulous victims for the encouragement of evil doings. Naturally the victim may not regard this responsibility very seriously as it affects the rogue; but there can be no question but that either directly or indirectly others besides the promoter are in some degree responsible for the success of swindling schemes.

Here's just a small item for your encouragement. A year or more ago the writer refused to longer receive "Capper's Weekly," a sheet filled with fake advertisements and owned by the present Governor-elect of Kansas. I told him my reason, too, in no uncertain language. January 1st next, at the expiration of my subscriptions to two dailies I intend to order both stopped for the same reason, and *to tell the publishers why*. One of them is the local daily, but luckily there is another one that refuses fake advertisements of almost all kinds, so I will be killing two birds with one stone in this case. The writer hopes to see our Anti-Fake Club big enough some day to deal real blows to these silent partners of the swindlers. Don't bother to acknowledge this. It's simply meant as a word of cheer. J. H. T.

Nebraska.

This correspondent certainly qualifies as a member of the Anti-Fake Club. If THE R. N.-Y. were influenced by selfish motives, it would do nothing to compel the clean-up of the advertising columns of other publications. As the number of clean publications increases, THE R. N.-Y. must be less conspicuous in this particular than it is now, and has been. But the purpose is not and never has been a selfish one. As a member of the publishing fraternity, it does a duty to the public to protect them from fakes and rogues and swindlers: and it also recognizes its obligations in its influence on other publications. We believe the Anti-Fake Club will yet have a membership of a million; and if one-half of them do their duty, publishers will soon find a way to detect and reject fraudulent advertisements. We hope the Governor-elect of Kansas will remove the cause of complaint.

Frederick Nugent had a pet society called the "Iridescent Order of the Iris." Concentration was the keynote. The first act in the concentration was to send $1 for a lucky stone, which at wholesale would be about $5 a gross. For $12.50 they would receive a course in any one of 19 different courses—"How to Be a Hypnotist," "How to Grow Handsome," and "How to Obtain Money For Others to Start in Business," are among the courses offered. Even persons as prejudiced as United States Postal inspectors had to admit that Nugent's swindle was a good one. It is reported there were 1,800 customers scattered throughout the country. Six clerks were helping him when he was arrested for using the mails to defraud. Nugent has been sentenced to 18 months in Atlanta penitentiary. Prof. Frederick, a palmist, and Prof. Jean D. Astro, an astrologist, were also sent to Atlanta for 18 months. J. J. D.

PASTEURIZING MILK.

WOULD you give me information about the pasteurizing of milk? I am a farmer selling milk to the city, and would like to know if it would be practical for me to buy an outfit and cows, and go to selling this kind of milk. The city board of health is the only one that sells this milk in the city at the present. It is sort of charity on their part. Are there any farmers doing this thing in other cities? I do not know what price I could get for this milk; the price the city charges is no higher than eight cents a quart. It is not delivered at this price. I suppose one trouble would be the delivery, as one would have to travel all over the city to different customers. I think if pasteurized milk was offered for sale in the city there would be a good sale for it. Are the outfits too expensive for an individual to use to good advantage. J. D. S.

New York.

I do not, of course, know what demand there may be for pasteurized milk in the city to which you ship, but I think that you may, possibly, have a somewhat mistaken idea of the nature of this product. Pasteurization does not improve clean, wholesome milk; in fact, it would injure such milk. The object of pasteurization is to destroy any harmful germs that may have obtained access to milk through careless handling of it, and it is a necessary measure when milk is known or believed to have been so indifferently handled as to make its purity open to question. As has been said, however, "pure milk is better than purified milk," and it would be better for a milk producer who wishes a special trade to procure such equipment and exercise such care as would give him a reputation for dependably pure milk than to attempt to establish a trade in milk that concededly needed purifying.

Any process that will raise the temperature of milk to 145 degrees F. and maintain it at that temperature for 30 minutes will pasteurize it (N. Y. State Sanitary Code). This may be done on a small scale by setting a bottle of milk in a vessel of boiling water on the kitchen stove or on a commercial scale, by the use of elaborate and expensive steam-heating apparatus. Pasteurization is only part of the process, however; after this is done, the milk must be rapidly cooled to a low temperature and held there until used. Pasteurization destroys only part of the germs in impure milk—the more harmful ones—and those remaining will multiply with greater rapidity than ever if milk that has once been heated is not rapidly cooled. This is due to the fact that heating to some extent destroys the natural germicidal power of raw milk. This latter fact makes it imperative that pasteurized milk shall be placed and kept in only absolutely clean containers; preferably sealed. The impracticability of getting market milk that is absolutely dependable in its purity has led cities to adopt pasteurization as a means of making their milk safe, and it is not unlikely that in the near future some cities will require that all milk below the grade of "Certified" offered for sale shall have been pasturized and placed in sterilized and sealed containers. M. B. D.

POMPOUS LADY: "Must I put this stamp on myself?" Postoffice Clerk: "Well, you can if you like, but it's usual to put it on the letter."—London Standard.

WHEN you write advertisers mention THE R. N.-Y. and you'll get a quick reply and a "square deal." See guarantee editorial page.

4-BUCKLE One Piece ARCTIC

Products, Prices and Trade.

Wholesale Prices at New York,

Week Ending Dec. 18, 1914.

MILK.

The Borden milk schedule to producers for the six months beginning with October is as follows. This is per 100 pounds in the 26-cent zone. This is what is known as the "maximum" for milk testing 3.8 to 4.2 per cent. fat, and is 20 cents per 100 pounds above the "flat" rate.

1914.	
October	$2.00
November	2.10
December	2.10
January	2.05
February	1.95
March	1.90

Wholesale prices paid by New York dealers are running $2.01 and $1.91 for B and C. Hotel and restaurants using two to three cans per day are paying five to six cents per quart, single quart prices from bakeries and grocery stores, six to seven cents; delivered milk, nine to 10 cents.

BUTTER.

Prices are without change from last week, but business is dull, and there is some surplus of medium grade creamery. Ladles and packing stock selling well.

Creamery, extra, above 92 score, lb	33½	@	34
Extra, 92 score	32½	@	33
Good to Choice	28	@	32
Lower Grades	28	@	25

Common to Good	23	@	28
Ladles	20	@	23
Packing Stock	19	@	22
Process	22	@	26

Elgin, Ill., butter market 32 cents.
Philadelphia, western creamery, 34 cents.
Boston, western creamery, 33.
Chicago creamery, 24@32.

CHEESE.

The market on most grades of whole milk is one-fourth cent lower. Trade is very quiet and exporters not doing much.

Whole Milk, fresh, specials	15¾	@	16
Average fancy	15½	@	15¾
Under grades	12	@	14
Daisies, Wisconsin	14½	@	15¼
Skims, specials	13	@	13½
Good to choice	11	@	12
Poor to fair	7	@	10

EGGS

Prices on fancy white dropped five cents per dozen. This grade is still comparatively scarce, but the extreme figures asked recently lessened the demand to such an extent that the drop seemed necessary. Storage stock is three cents lower.

White, choice to fancy, large	52	@	53
Medium to good	42	@	50
Mixed colors, best	43	@	46
Common to good	25	@	35
Storage, best	25	@	27
Lower grades	18	@	23

FRESH FRUITS.

The sudden cold snap did some damage to apples in exposed situations, resulting in temporary declines of 25 to 50 cents per barrel. Grapes are about gone. Prices for the season have been low. Fair supplies of strawberries are being received steadily now from Florida and California, wholesaling at upwards of 50 cents per quart.

Apples—BenDavis, bbl	1 50	@	2 00
York Imperial	1 50	@	2 50
McIntosh	2 50	@	4 70
Jonathan	2 50	@	3 75

BEANS.

Marrow are five cents lower and Pea and Red Kidney 10 cents per hundred pounds higher.

Marrow, 100 lbs	6 30	@	6 35
Medium	4 50	@	4 65
Pea	4 55	@	4 60
Red Kidney	5 30	@	5 35
White Kidney	7 15	@	7 25
Yellow Eye	5 15	@	5 25
Lima, California	5 90	@	6 00

VEGETABLES.

Potatoes mainly 10 to 15 cents per barrel lower. The condition in the large markets cause a depressing outlook in many primary points, particularly Maine, where large quantities are in storage. The railroad movement from the Aroostook section is unusually light for this time of year. Best grades of Danish seed cabbage are $2 per ton higher. A Bermuda steamer in this week was so much delayed that the vegetable cargo was damaged. Added to the frosted southern vegetables this made low prices and considerable waste.

GRAIN.

Grain has sold on a generally higher basis than last week, but declined toward the close, mainly because of the war news, indicating a possible slowing up of exports. In the event of a naval battle of much magnitude, part of the present Atlantic patrol might be diverted for use in Europe, leaving the Atlantic without protection for slow merchant vessels.

A shipment of 330,000 dozen cold storage eggs was sent from Boston to London this week.

*

Missouri's crops this year are valued at $201,500,000, which is $9,000,000 above the five year average.

*

Our total circulation of money October 1 was as follows:

Gold coin	$657,944,193
Silver dollars	70,724,311
Small silver	161,565,114
Gold certificates	931,390,259
Silver certificates	482,892,121
Treasury notes	2,388,789
United States notes	336,974,246
Nat'l Bank notes	1,050,869,196

*

For the year ending June 30, 1914, the Government paid the railroads $50,853,360 for carrying mails. The appropriation for the next fiscal year is $56,188,000.

*

REPORTS received by the Department of Agriculture in 16 leading onion-producing States show that this year the estimated commercial onion crop is 21,623 carloads as compared with 18,934 carloads last year. Last year 6,695 carloads were held in storage at these points for later sale. The estimated number this year is 7,879 carloads. These 16 States produce three-fourths of the onion crop. The cabbage reports from 10 of the leading States show 18,694 carloads were shipped in 1913, and this year 20,390 carloads will be produced. Of the number last year 4,229 were held in storage for later sale, and this year about 4,645 are being placed in storage. The 10 States from which reports were received produce two-thirds of the annual crop.

Ayrshire Breeders' Annual Meeting.

The 40th annual meeting of the Ayrshire Breeders' Association will be held Thursday, January 14, 1915, at Hotel Manhattan, New York, at 2 o'clock P. M. All interested in Ayrshire cattle are invited to attend this meeting. A meeting of the Executive Committee is requested at 10 A. M. in the Hotel Committee Room. The association cordially invites all its members to a banquet to be given by the association in the evening, after the meeting.

C. M. WINSLOW, Secretary.

Brandon, Vt.

Dec. 13. Apples per bbl., $2.50; potatoes per bushel, 50; butter, 35; hogs, dressed, per lb., 11; native beef, dressed, 8 and 9; eggs, 50; beans, Maine yellow eyes, $4. D. M. H.

Ellsworth, Me.

Dec. 7. Good dairy butter only brings 28 to 30c.; potatoes, 50 cents per bushel in a small way (40 f. o. b. car). Fat steers five cents per pound; new milch cows, $40 to $60. Eggs, 42. This is a good farming community but very poor market. L. H. B.

Chester, Vt.

Dec. 15. Cows are from $35 to $75; eggs, 40, at the store. Butter 33 at the grocery, and they get 40. Apples about 50; potatoes, 50; pork, best, 11; honey, 20, wholesale, 25 at retail. I get six cents per quart at the door for milk. Chickens, 16; pigs, $3 four weeks old; hens, 75 to $1. S. K. V.

Cumberland Center, Me.

Dec. 8. Beef by the quarter, 9c.; pork, 11; chickens, 18; calves, live, 6 to 8. Butter, 35; milk, 8½-quart cans on the car, 35 cents for month of November; average for six months, 32 cents. Eggs, 42; potatoes, 50; squash, 2½c. a lb.; cabbage, 1½c.; beets, 2c. per lb. Turnips, 60 cents a bushel; apples, $2 per barrel. W. D. S.

West Rumney, N. H.

Dec. 14. Fall was quite dry until past two weeks, some rain now, quite snow squall. Early sown wheat I think badly affected with insects, crop generally quite good here past season; farmers felt quite encouraged until the foot and mouth disease broke out. As we had no foot and mouth disease in our city I could see no reason why our stock was not inspected and shipped in disinfected cars to any market out of the State. I think the farmers should insist on a law to regulate the shipping and sale of stock out of the State when there is no foot and mouth disease. W. D.

Noble Co., Ill.

YOUNG WIFE: Your mother a fine cook? I don't believe it. I've heard that your father was a chronic dyspeptic. Husband: Well, that's all right; mother learned by practicing on father.—Boston Transcript.

NEW JERSEY GARDEN, FRUIT, STOCK & POULTRY FARMS. We handle the best. A. WARREN DRESSER, Burlington, New Jersey

Subscribers' Exchange

Complying with several suggestions received recently, we open a department here to enable RURAL NEW-YORKER readers to supply each other's wants. If you want to buy or sell or exchange, make it known here. This Rate will be 5 Cents a word, payable in advance. The name and address must be counted as part of the advertisement. Copy must reach us not later than Friday to appear in the following week. No display type used, and only Farm Products, Help and Positions Wanted admitted. For subscribers only. Dealers, jobbers and general manufacturers' announcements not admitted here. Poultry, Eggs and other live stock advertisements will go under proper headings on other pages. Seed and Nursery advertisements will not be accepted for this column.

EXPERIENCED young man (20) wishes position on farm. Box 5, care of Rural New-Yorker.

WANTED—married man to work on dairy farm (board himself), house and garden furnished. D. F. ROBINSON, Pawlet, Vt.

UNMARRIED MAN wants position on commercial poultry farm; experienced. COMMERCIAL, Care Rural New-Yorker, 333 W. 30th St., N. Y. City.

YOUNG MAN, 21, four years' experience and good, dry hand milker, seeks position; best references. CHAS. SAKOVITZ, 984 Myrtle ave., Brooklyn, N. Y.

WANTED—Position as working foreman or manager of farm by single man of experience; several years in institution work. A. Y., care Rural New-Yorker.

WANTED—Position as farm manager; sold farm; understands stock, breeding and raising of all farm crops; married, no children; temperate. Box 4, care R. N.-Y.

UNMARRIED MAN of character; farm reared and some experience in poultry, wants work on poultry farm in Eastern States. Address CLARENCE PARR, Lakehurst, N. J.

MARRIED MAN, no bad habits, at present employed, wishes position to grow vegetables, fruit, flowers, and poultry, and to produce honey for private estate; any part of the country. Address "COMPETENT," care Rural New-Yorker.

SUPERINTENDENT WANTED—Married, about 35 to 40 years of age, strong and at present employed; collewe trained, expert in purebred Holstein cattle, A. R. O. feeding and dairying. Accountant, business capacity; an all-round farmer. MOHEGAN FARM, Peekskill, N. Y.

WANTED—A man to care for and milk 20 cows, milk Grade A; must be a good milker, separate 30-40 quarts per day; feeding skimmed milk to calves and hogs; he must also take care of 2-4 brood sows and young pigs; $30 a month and board for right man. Write E. V. WATSON, Beacon, N. Y

ALFALFA HAY—F. P. ERKENBECK, Fayetteville, N. Y.

WANTED—Power Mann Bone Cutter No. 12. W. D. LARKIN, West Berlin, Mass.

WANTED—Prairie State Incubators, 1912 or 1913 model, 390 eggs. ORO FARM, Congers, N. Y.

NEW HONEY—Basswood or clover in sixty-pound cans. Write for prices. C. A. HATCH, Richland Center, Wis.

APPLES, APPLES, APPLES—For choice sprayed Winter Apples. Please order to-day. C. J. YODER, Grantsville, Md.

CHRISTMAS ORANGES. Orange Marmalade direct to consumer; sample 25 cents. H. C. TILLSON, Leesburg, Fla.

28 INCUBATORS FOR SALE—All models, 260 and 360 eggs, in first-class condition; reasons for selling, am installing a Mammoth machine; write for prices. CHAS. R. STONE, Staatsburg, N. Y.

FOR SALE—150 bushels choice Japanese buckwheat in lots to suit purchaser, 85c. per bushel, sacks included; nothing better when ground for cattle or poultry. THE CASKEY FARMS, Richmondville, N. Y.

FRESH COUNTRY SAUSAGE—Home-made, of superior quality, from specially fattened little milk-and-grain fed pigs; not too highly seasoned; 4 lbs., $1; 8 lbs., $2; postpaid within Third Zone; also hams and bacon ready January at 28c. lb. SANDANONAH FARM, Windham, N. Y.

ANY ONE desiring a fruit and poultry farm address R. T. MILLER, Vineland, N. J.

WANTED—Small, equipped poultry fruit farm; near station; price, full particulars. FARMER, care R. N.-Y.

FOR SALE—Farm 65 acres, good buildings, cheap; to R. R. 10 miles. F. G. SEARS, West Cummington, Mass.

FOR SALE—A good dairy or general purpose farm, 180 acres; good buildings and location; $6,000. PETER GIBBS, Tioga Center, N. Y.

400-ACRE Rensselaer County Dairy Farm; modern equipped home, 20 farm buildings, 3 tenant houses. Owner, L. R. RICKERSON, Mechanicsville, N. Y.

FOR SALE—8 acres, with or without buildings, within 15 minutes' walk of ocean, river and two depots; easy terms. JULIUS ABRAMS, owner, Belmar, N. J.

FOR SALE—At a Great bargain, two 80-acre farms on good terms; extra well located and on good roads and near school and railroads. F. M. KERN, Springville, Indiana.

FARM BUYER write me about the best 170-acre farm in county; five thousand five hundred; investigation means buy. EMERY C. MIX, Justice of the Peace, Willseyville, Tioga Co., N. Y.

FARM FOR SALE, or to let—Large house and barns, 175 acres; easy terms; 100 miles from New York, one mile from railroad, churches, schools, etc. For particulars address C. P. BYINGTON, Ossining, N. Y.

FOR SALE—A small farm of about seven acres, consisting of a variety of fine fruit, enormous asparagus bed, poultry, eight-room cottage, all necessary outbuildings, an abundance of water; situated in the famous and fertile Shenandoah Valley in Virginia. Address J. T. KANE, R. F. D. 2, Berryville, Va.

TO LET—Large brick factory buildings, tenant houses, barns and water power, with wheel and shafting ready for immediate use at Malden Bridge, Columbia County, N. Y.; three miles on State road to Chatham Center, a station on Boston & Albany railroad; nominal rent for first year; also thirty acres of land, if desired. Write for particulars, E. W. RIDER, 50 Court Street, Brooklyn, N. Y.

DONT PAY Freight on Water

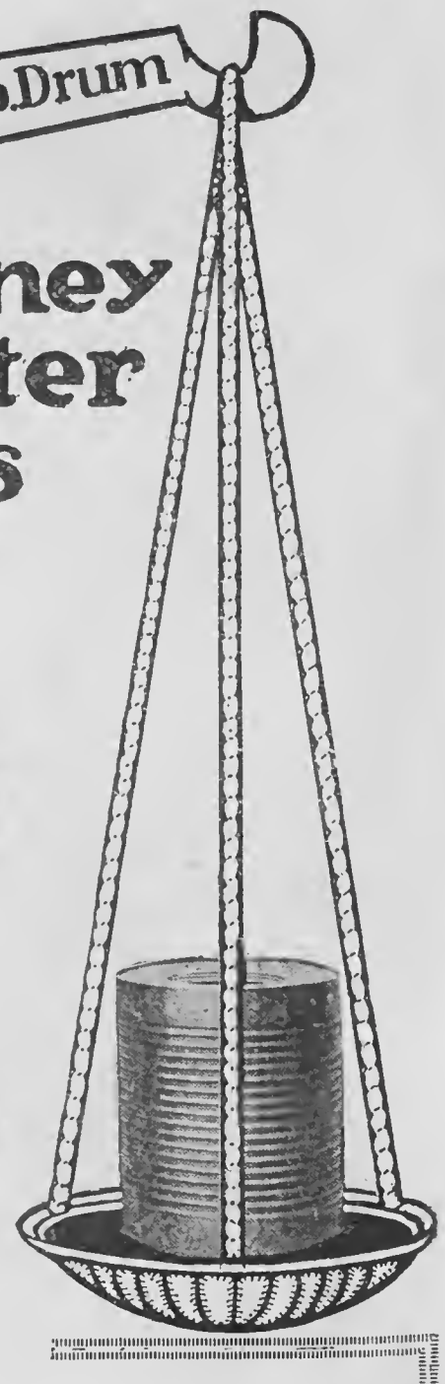
600 lb. Barrel Lot — equal to 100 lb. Drum

Save Money Get Better Results

Spray with Niagara

SOLUBLE SULPHUR COMPOUND

This powdered spray material dissolves instantly in hot or cold water and is the best, and in the long run, the cheapest spray material ever produced



For the Control of San José Scale

Niagara Soluble Sulphur Compound was first placed on the market in 1911, and has met with such tremendous enthusiasm that this season we have just completed a new plant which is capable of producing 60,000 lbs. every 24 hours. In other words, we manufacture and sell an amount of spray material in a single month, which when diluted, will spray 9,000,000 fruit trees of average size.

Read These Twelve Reasons

Why Niagara Soluble Sulphur Compound is the most economical, practical, efficient and convenient spray material for the practical fruit grower.

1—100 pounds of Niagara Soluble Sulphur Compound is equivalent to 600 pounds of commercial lime-sulphur solution. **Why pay freight on water?**

2—A 100-pound drum of NIAGARA SOLUBLE SULPHUR COMPOUND makes more diluted spray material than a barrel of lime-sulphur solution; **reducing the actual cost of material.**

3—NIAGARA SOLUBLE SULPHUR COMPOUND is neat and convenient to handle.

4—NIAGARA SOLUBLE SULPHUR COMPOUND comes in inexpensive metal drums, which when empty may be thrown away; **no money paid out for barrels; no bother returning empty package.**

5—Its powdered form makes **leakage impossible.**

6—NIAGARA SOLUBLE SULPHUR COMPOUND keeps indefinitely anywhere, **and can be held over from one season to another without loss.**

7—NIAGARA SOLUBLE SULPHUR COMPOUND is equal to and has proven many times to be superior to lime-sulphur solution in insecticidal and fungicidal value.

8—A drum of NIAGARA SOLUBLE SULPHUR COMPOUND may be carried in buggy or automobile, making hauling convenient and inexpensive. **One man handles it easily.**

9—NIAGARA SOLUBLE SULPHUR COMPOUND may easily be obtained in small packages. It is put up in 100, 50, 25, 10, 5 and 1 pound cans.

10—NIAGARA SOLUBLE SULPHUR COMPOUND is at least 25% **cheaper** to use than any other material, when it is considered that a 100-pound drum makes 60% more spray than a barrel of lime-sulphur solution; less expense to hauling and handling; no loss from leakage and crystallization; keeps indefinitely and no empty barrel to return.

11—Will not wash off the trees.

12—Leaves a fine waxy finish on fruit.

Read What These Three Experienced Fruit Growers Have to Say

There's a User in Your Neighborhood

Quincy, Ill., Sept. 3, 1914.

Niagara Sprayer Co.,
Middleport, N. Y.

Gentlemen:—

I have used a quantity of your NIAGARA SOLUBLE SULPHUR COMPOUND and have been a large user of old liquid solution. I feel sure the NIAGARA SOLUBLE SULPHUR COMPOUND is at least as good in its effect, very much more convenient to handle, as well as, being cheaper. I will use it exclusively on my 1,200-acre orchard next season.

Yours truly,
C. H. Williamson.

(Mr. Williamson harvested 40,000 barrels of apples this year.)

Kansas City, Mo., Jan. 29, 1914.

Niagara Sprayer Co.,
Middleport, N. Y.

Gentlemen:—

We are very much pleased with NIAGARA SOLUBLE SULPHUR COMPOUND and are very glad, indeed, that we started to use it. The fruit is as clean as a "Hound's Tooth," and is very healthy looking; more so than we have ever been able to obtain from lime-sulphur solution.

Very truly yours,
Mo. Valley Orchard & Live Stock Co.,
Per G. C. Richardson, Gen. Mgr.

(The Missouri Valley orchards consist of over 800 acres of 16-year-old apple orchard.)

Roanoke, Va., Sept. 15, 1914.

Niagara Sprayer Co.,
Middleport, N. Y.

Gentlemen:—

Last spring I sprayed my apple and peach orchards with NIAGARA SOLUBLE SULPHUR COMPOUND, manufactured by you, and it surely did kill all the scale and trees are in a healthy condition. I consider NIAGARA SOLUBLE SULPHUR COMPOUND far superior to the lime and sulphur sprays and will use no other. It is the most convenient and cheapest, and far the best spraying material on the market, and I can cheerfully recommend it to all fruit growers.

Respectfully,
John H. Sampson.

The New Niagara Triplex Power Sprayer proven by actual test the most efficient spray rig on the market to-day, is guaranteed to spray out 7 gallons of liquid per minute, and at the same time maintain a working pressure of 200 to 250 pounds. Is equipped with our famous porcelain lined cylinders, guaranteed for lifetime. The workmanship and materials for this machinery are the best that skill and money can produce.

SEND FOR PRICE LIST AND MACHINERY CATALOG.

Extensive Field experiments under the directions of our experimental and research department has made possible the publication of the following booklets, which contain valuable facts about producing quality fruit. Send the coupon today for those which interest you most.

1—An up-to-the-minute spray calendar, containing live information that will produce results.

2—A scientific bulletin describing actual field experiments, as carried on in our large experimental orchards.

3—General catalog and testimonial booklet, giving the experiences of successful fruit growers all over the country who use NIAGARA SOLUBLE SULPHUR COMPOUND.

Everything For Spraying

We also manufacture the following spray materials, which are the very best that it is possible for science to produce. NIAGARA SOLUBLE SULPHUR COMPOUND, NIAGARA ARSENATE OF LEAD, (Dry or Paste) NIAGARA BORDEAUX ARSENATE, NIAGARA CYLLA-AFIS SPRAY, NIAGARA No. 9 TRIPLEX POWER GASOLINE SPRAYING MACHINERY, NIAGARA ORCHARD AND CROP SPRAYER and a complete line of spraying machinery and accessories including Hand Pumps, Nozzles, Rods, Hose, Fittings and etc.

It will pay every fruit grower who wishes to produce better quality fruit to mark his wants on the coupon, sign his name and send it today. Be sure to get the spray calendar, scientific bulletin and testimonial book.
